In 1848 the February Revolution broke out. The Brussels authorities feared disturbance, and compelled Marx to change Belgian for French soil. Marx was not at all unwilling, and he proceeded to Paris. A manifesto was at once drawn up for circulation in Germany, in which 17 demands were advanced by the Communist Party. These demands comprised the proclamation of a republic ; payment of members of Parliament, so that working men might be eligible for election ; the conversion of " princely and other feudal estates," with mines, etc., into State property ; the appropriation of all means of transport, as railways, canals, steamships, roads, and posts, by the State ; the restriction of the law of succession ; the introduction of heavy progressive taxes and the abolition of excise duties ; the establishment of national workshops ; State guarantee to all work people of an existence and provision for the incapable ; and universal and free education. Shortly afterward Marx returned to Germany, and along with Engels, Wolff, and Freiligrath founded the *Neue Rheinische Zeitung* at Cologne, the first number appearing on June 1, 1848. For his utterances Marx had twice to appear at the Assizes, but he was each time acquitted. In May, 1849, there were risings in Dresden and the Rhine Province, and Marx was not slow to give them his editorial benediction. The newspaper was suppressed, and the last number appeared, printed in red ink, on June 19.

Expelled from Prussia, Marx first went to Paris, but refused residence there he went to England. From this time Marx lived continuously in London, with casual visits paid to Germany and other countries for the purpose of agitation. He found London a favorable place for the further study of political economy, and resolved to begin his work again from the very commencement. His studies were frequently broken, for it was necessary to earn a livelihood, and the duties of correspondent to the New York *Tribune*, which Marx fulfilled for eight years, consumed a large part of his time. His *Zur Kritik der Politischen Oekonomie* bears the date January, 1859, a work containing the principles which were afterward to be de-

The
Manifesto.

veloped in *Das Kapital*. While carrying on his studies Marx came again prominently to the front in 1863 and 1864, when new endeavors were made to unite the working classes of various countries. The result of the agitation was the formation on May 28, 1864, of the International Working Men's Association. (See INTERNATIONAL.) Three years later Marx published the first volume of his great economic work, *Das Kapital*. Upon this work rests the reputation of Marx as a political economist.

Marx's later public life was identified with the International (*q.v.*), of which he was the first president. He became leader of the wing

which favored the development of communism by the orderly political capture of the State, as opposed to the violent overturn of the State. (See ANARCHISM.)

Out of Marx's policy has grown the German and now world-wide political socialist movement, which accepting the economics taught by Marx, looks to him as its founder. Some believe that this turning of the communistic movement into political channels will be looked upon as Marx's greatest deed—a deed more important than his economic teachings, which, however brilliantly stated, are not peculiar to him. The English-reading public, however, has never done justice to Marx's economic teachings, because it has derived its notion of those teachings mainly from the first volume of *Das Kapital*, which was long alone of Marx's writings translated into English. This volume, tho brilliant,

is almost purely analytic and critical of the capitalistic movement and economics. His more constructive works are much less known. The reason for the first volume of *Das Kapital* being the one alone

translated was that Marx never lived himself to edit the remaining two volumes, tho after his death they were published by Engels from Karl Marx's notes (the second volume in 1885, the third in 1895). Marx died in London, March 14th, 1883. One of his daughters married the French socialist La Fargue (*q.v.*), and the other the English socialist Edward Aveling (*q.v.*).

The best brief account of Marx's economic teachings is to be found in Professor Laveleye's *Socialism of To-day* (chap. iv.), from which we abridge the following account, referring the reader to the article CAPITAL for a critical review by Professor Böhm-Bawerk :

"Marx bases his system on principles formulated by Adam Smith, Ricardo, Bastiat, and their followers.

"In respect of value, says Marx, commodities intended for exchange are crystallized labor. The unit of labor is an average day's work, which varies in different countries and at different times, but which may be considered a fixed quantity in a given community. An article possesses economic or exchange value only because it represents labor. What can be obtained without labor, like air and water, has no exchange value.

"How is the quantity of values of an article to be measured? By the quantity of labor that it contains. The quantity of labor is itself measured by the duration of the labor, by days and hours. Here Marx makes a correction in the theory of Smith and Ricardo, and forestalls an objection. It might be said that, if it is the duration of the labor that creates the value of the products, a coat which took a tailor twice as long

to make as was necessary would therefore be twice as valuable. Not so, replies Marx ; the measure of the value of things is the duration of the labor on the average requisite, performed with the average amount of skill and diligence, and in the normal industrial conditions at any given time.

"From these premises, our author concludes that labor becomes more productive and creates more utilities to no purpose ; it does not produce more value. In fact, if labor measured by time is the sole source of value, articles manufactured in greater quantity in the same lapse of time, all put together, represent no more value, because each individual article is worth less. By the strictly logical chain of these abstractions we arrive at this singular result, that all the inventions of science, all the improvements of manufacture, produce more utilities without increasing the sum total of exchange values. How, then, does the capitalist make money? First of all he buys machines, tools, raw materials, and then, in order to work up the materials, he purchases the workman's 'labor force,' *arbeitskraft*, the sole source of all value. He sets the laborer to work to change, by means of the tools and machines, the raw materials into manufactured articles, and sells them for more than they cost him to make. In this way he obtains a greater value, 'surplus value' (*mehrwert*). The money, temporarily transformed into wages and merchandise, reappears under its original form, but more or less increased in amount ; it has brought forth young—capital is born.

"This would seem to conflict with the principle laid down above, that exchange does not create new value. The manufacturer has only made exchanges, and yet he finds himself in possession of a greater value. The explanation of the mystery is as follows: The capitalist pays for labor its exchange value, and thus obtains its value in use. Labor force has the unique characteristic of producing more than it costs to be produced. He who buys it and sets it to work for his gain enjoys then the source of all wealth. The capitalist pays for labor its value. What is the value of labor? Like all other merchandise, it is worth what it costs in time and trouble to be produced ; that is to say, its cost of production. The cost of production of labor is the food and different commodities necessary to support the laborer and the children destined to succeed him. The value of all these commodities is measured in its turn by the time that it takes to produce them. In short, then, according to Marx, the value of labor is equivalent to the sum of hours required to create what the maintenance of the laborer demands. But to produce the commodities necessary for the existence of the laborer and his family during a day, a whole day's work is not needed. Marx supposes that five or six hours suffice. If, then, the laborer worked for himself, he could obtain all he needed in a half day, and the rest of his time he might devote to leisure or to procuring superfluities ; but the slave of antiquity, the serf of the Middle Ages, when gaining his freedom in the existing social order, did not at the same time acquire property. He is therefore obliged to place himself in the service of those who possess the land and the instruments of production. These naturally require him to work for them the whole day of 12 hours or more. In six hours the laborer produces the equivalent of his subsistence ; this is what Marx terms 'the necessary labor ;' during the remaining six hours he produces the 'surplus value,' the *mehrwert*, to the profit of his employers. The capitalist pays the laborer for his labor-power at its value ; that is to say, by giving him the amount of money which, representing six hours' labor, permits him to buy the necessaries of life ; but as he thus obtains the free disposal of this productive force for which he has paid, he acquires everything it produces during the entire day. He therefore exchanges the produce of six hours against the labor of 12 hours, and puts in his pocket, as net profit, the produce of the six hours beyond the 'necessary labor.' From this surplus, pocketed by the employer, capital comes into being.

"The capitalist has different methods of increasing his profits. The first consists in multiplying the number of his workmen. The second method is to lengthen the working day. The longer the laborer works beyond the necessary time which represents his wages, the greater the profit he brings to his master. The third method consists in diminishing the duration of the 'necessary labor,' the hours which the laborer must work to produce his maintenance. This is done by rendering the labor more productive. As his hours

The Capitalist Process.

labor obtain the same price, no matter what they produce, if twice as many articles can be made in the hour, each article will cost one half less and the laborer will have one half less to spend on living; he will therefore be able to sell his labor force for a remuneration reduced by one half. All these deductions appear to be irrefutable, and we thus arrive at this singular conclusion, that the more the employment of machines and of improved methods increases the productivity of labor, the lower wages fall and the greater the profits of the capitalist become.

"According to Marx, the capitalist régime is of recent origin. It dates from the sixteenth century, when the large proprietors, impoverished by the wars of the Middle Ages, gradually drove their retainers from the soil, and thus formed a landless proletariat compelled to compete for wages. History is to Marx a portion of natural history. He says in the preface to the first edition: 'My standpoint, from which the evolution of the economic formation of society is received as a process of natural history, can less than any other make the individual responsible for relations whose creatures he socially remains, however much he may subjectively raise himself above them.'

"According to Marx, the capitalistic era is a necessary epoch, which must in time give place to communistic production. Capitalistic production, by compelling workmen to work for simply what is necessary to support life, cuts off its own market, since the workman has no money left to buy with! Hence capital is compelled to turn to commerce to supply it with ever new fields and markets for it to exploit. But this ends. There are no more new worlds for it to conquer, and so it is working its own ruin. Marx says: 'One capitalist ever kills many. Hand in hand with this centralization, or the expropriation of many capitalists by few, are developed the cooperative form of the labor process—and that on a constantly increasing scale—the intelligent application of science to technical purposes, the systematic exploitation of the soil, the transformation of the means of labor into means of labor only usable in common, the economizing of all means of production by their use for production by combined social labor, the entwining of all nations in the net of the world market, and thus the international

The Present Situation.

character of the capitalist régime. With the steady decrease of the capital magnates, who usurp and monopolize all the advantages of this process of transformation, the mass of want, oppression, servitude, degradation, and spoliation grows; but the revolt of the laboring class—swelling ever in numbers, and disciplined, united, and organized by the mechanism of the capitalist process of production itself—spreads at the same time. The capitalist monopoly becomes a fetter on the mode of production with and under which it has originated. The centralization of the means of production and the socialization of labor reach a point at which they become no longer compatible with their capitalist integument, and this is burst asunder. The last hour of capitalist private property strikes. The expropriators are expropriated.'

"In the first case there is the expropriation of the mass of the people by a few usurpers, but in the latter the expropriation of a few usurpers by the mass of the people.

"Marx would make land and all the instruments of production collective and social property. He would go farther; he would have all subjects of the State share equally in labor and the produce of labor. His future State is a Labor State, in which labor will be compulsory on all who are capable. In *Capital* we find him developing the idea of uniting agriculture with industry, which is advanced in the Communist Manifesto written in 1847. He would have great variety in the labor of the individual, so that he may be as many-sided as possible."

Such, in brief, is Karl Marx's socialism. On account of its intellectual brilliancy and acumen, and the influence it has had on Germans, it has been called distinctively "Scientific Socialism;" yet to-day it is not accepted by many scientific socialists, much less other political economists. In its merciless logic and Hegelian dialectic, it is indeed scarcely possible to pick a flaw; but some socialists say that it starts from a wrong premise. Marx's error is not his, but inherited from Adam Smith and Ricardo. Labor is not

the only source of value. If Adam Smith and Ricardo are right in saying that it is, then Marxian socialism follows. It takes more than labor to produce value. Labor is only one of the elements. Socialists who do not follow Marx's economics arrive at his results, but through other channels. (See SOCIALISM; VALUE.) The acumen of Marx's analysis of the orthodox economics and his contribution to the development of political socialism are, however, beyond all question. The best account of Marx is in Dawson's *German Socialism* (1888).

MAURICE, JOHN FREDERICK DENISON, was born at Normanston, Suffolk, Eng., in 1805, the son of a Unitarian minister. Graduating at Trinity, Cambridge, he took a degree in law, but early devoted himself to writing on religious and social questions, particularly in *The Athenæum*. In 1831 he entered the Church of England, and went to Oxford and obtained a second class in classics in 1831. His first curacy was at Bubbenhall, Warwickshire, but from 1836-46 he was chaplain at Guy's Hospital, London. His writings were already attracting attention. In 1835 he wrote *Subscription vs. Bondage*, and an article subsequently enlarged into his *Moral and Metaphysical Philosophy* (1850-57). In his *Kingdom of Christ* (1838), *Lectures on Education* (1839), *Reasons for not Joining a Party in the Church* (1841), he laid the foundations for the theological views of which in the present century he is undoubtedly the great master, with his high conception of the church and the nation, and yet with a catholic conception of Christianity that found room in it for what—tho he himself repudiated the name—has been later called "Broad Church" divinity. From 1846-59 he was chaplain at Lincoln's Inn, and it was to this period that his Christian Socialist activities belong. (For a full account of this movement, see CHRISTIAN SOCIALISM.) His attention was first prominently called to socialism and its moral significance by Ludlow, but Maurice became the "master" of the little school of thinkers and workers that gathered round, and he proposed the name Christian Socialism, saying that it was the only name that would deliver us to the conflict we must sooner or later wage with unsocial Christians and with unchristian socialists. He contributed largely to the literature of the movement, and entered earnestly into the practical details of establishing cooperative tailors' stores; but when this movement had become somewhat established (see COOPERATION) he withdrew to devote himself more purely to educational and intellectual work. He was one of the prime movers in establishing the Workingmen's College and the Queen's College for Women, and in 1854 became principal of the former. In 1840 he had been made Professor of English Literature and History at King's College, and in 1846 Professor of Divinity, but in 1853 he was deprived of his chair because of his theological and social views. From 1860-69 he was incumbent of St. Peter's, De Vere Street. In 1866 he was chosen Professor of Moral Philosophy at Cambridge, from whence he published his *Social Morality* (1869). He died in London in 1872. His writings were

numerous and varied. Those bearing directly on social themes we have mentioned. His *Life*, edited by his son, appeared in 1884.

MAYORALTY.—The mayor is the governor of a city. The word is said to have been first used in 1189, when Richard I. substituted a mayor for the two bailiffs of London. In Europe, the mayor is not usually elected by the voters, but by the City Council. In England, he is usually chosen only for one year. In Germany, he may be elected for life, and may be chosen from any city; so that the mayor of a large city is usually one who has shown ability in a smaller city. In Paris, the prefect of the Seine corresponds to the mayor, tho there are *maires* of each *arrondissement* in the city. (See PARIS.)

In America, the mayors were chosen by the Council in New York till 1834; in Philadelphia, till 1839; but at present most mayors are elected by the people. Their terms of office vary from one year to four years. Their powers, too, materially vary. They usually have a veto power in the Council, the power of appointment and removal, with the consent of the City Council; but in 1882, Brooklyn, under Mr. Seth Low, commenced allowing the mayor to make his own appointments—thinking thus to fix responsibility—and for a while there was a general tendency to increase the power of the mayors. This is a kill or cure system. Under a good mayor like Mr. Low, it worked well. New York tried the same, and under Mayor Hewitt it worked well. But under a bad mayor it works ill, and the general tendency at present is to put more power in the Council and less power with the mayor.

MAZZINI, GIUSEPPE, was born in Genoa, Italy, June 22, 1808, his father being a physician of no little note. His first tutor was an old priest who taught him Latin, but his omnivorous reading was not directed by any master. At the age of 13 he attended classes in the faculty of arts at the university, and later studied anatomy to follow his father's profession, but he finally (1826) graduated in laws, and for some time was occupied in the *Ufficio dei Poveri*. From birth sentiments of social equality were engendered in him by the example of his parents; and very early the degraded political condition of his country began to prey upon his mind. Patriotic enthusiasm gained absolute sway over his spirit, and led him to renounce his cherished idea of a life of literature for the political arena. In 1827 his maiden essay in literature, *Dell' Amor Patrio di Dante*, appeared in the liberal journal, *Il Subalpino*; and he subsequently contributed to the *Autologia* of Florence and the *Indicatore Genovese*. In the pages of this latter originally appeared the essay subsequently republished under the title of *Scritti d'un Italiano Vivente*. But in the mean time the "republican instincts" which he tells us he had inherited from his mother had been developing. His articles accordingly became more and more suggestive of advanced liberalism in politics, and led to the suppression by government of the *Indicatore Genovese* and the *Indicatore Livornese* suc-

cessively. Mazzini joined the Carbonari, and was entrusted with a secret mission in Tuscany, but in 1830 was betrayed. He was imprisoned in the fortress of Savona on the western Riviera for about six months, when, through deficiency of evidence, he was released, but upon conditions involving so many restrictions that he preferred to leave the country. He went accordingly to France, living chiefly in Marseilles. Here, in presence of "those symbols of the infinite, the sky and the sea," and having access to no books but "a Tacitus, a Byron, and a Bible," he conceived the great mission or "apostolate" (as he himself called it) of his life, and organized a society destined to become famous throughout Europe, *La Giovine Italia*, or Young Italy. Its avowed aims were to be the liberation of Italy, both from foreign and domestic tyranny, and its unification under a republican form of government; the means to be used were education, and, where advisable, insurrection by guerrilla bands; the motto was "God and the people," and the banner was to bear on one side the words "Unity" and "Independence" and on the other "Liberty," "Equality," and "Humanity." In April, 1831, Charles Albert succeeded to the Sardinian throne, and Mazzini, as he afterward confessed, "the interpreter of a hope which he did not share," wrote the new king a letter, urging him to take the lead in the impending struggle for Italian independence. Its bold and outspoken words produced a great sensation, but so deep was the offence it gave to the Sardinian Government, that orders were issued for the immediate arrest and imprisonment of the author should he attempt to cross the frontier. Toward the end of the same year appeared the important Young Italy manifesto. "Congregations" were formed at Genoa, Leghorn, and elsewhere. Banished from Marseilles in consequence of the extensive operations of the society, Mazzini resorted to concealment for several months, principally in Switzerland.

About this time a charge was brought against him of advocating assassination as a legitimate weapon in the warfare of liberalism; but the charge was proved in the public tribunals of France to be false, and in the British Parliament (1845) Sir James Graham made an apology to Mazzini for having re-echoed the calumny. The firstfruits of *La Giovine Italia* was the revolutionary expedition of Savoy, organized by Mazzini at Geneva, but defeated by the royal troops. Sentence of death, *par contumace*, was recorded against Mazzini in the Sardinian courts for his participation in the affair; but he soon recommenced with increased vigor his revolutionary operations. A new association, entitled "New Europe," and based on principles of European rights and enfranchisement, was inaugurated by the exertions of Mazzini in Switzerland. In 1837 Mazzini quit- ted Switzerland for England, and finally took up his abode in London, where for many months he had to carry on a hard fight with poverty. Ultimately he was able to earn a livelihood by writing review articles, some of which have been reprinted, and are of the highest order of

literary merit ; they include papers on *Italian Literature since 1830, Lamennais, George Sand ; Byron and Goethe ; Lamartine ; Carlyle, and The Minor Works of Dante.* In 1839 he entered into relations with the revolutionary committees sitting in Malta and Paris, and in 1840 he originated a working men's association, and the weekly journal entitled *Apostolato Popolare*, in which the treatise *On the Duties of Man* was commenced. Among the labors undertaken by Mazzini was a free evening school conducted by himself and a few others for some years, at which several hundreds of Italian children received at least the rudiments of secular and religious education. A memorable episode arose out of the conduct of Sir James Graham, the English home secretary, in systematically opening Mazzini's letters as they passed through the post-office, and communicating their contents to the Neapolitan Government. The discussions in parliament, and the report of the committee appointed to inquire into the matter, did not lead to any result, except the vindication of Mazzini's character, which had been recklessly assailed in the course of debate. Mazzini did not share the enthusiastic hopes raised in the ranks of the Liberal party throughout Europe by the first acts of Pius IX., in 1846, but at the same time he availed himself of the opportunity to publish a letter addressed to the new pope. The revolutionary leaders had long been in correspondence with Mazzini, and their action, along with the revolution in Paris, brought him to Italy, where he took an active part in the events which dragged Charles Albert into an unprofitable war with Austria ; he actually for a short time bore arms under Garibaldi immediately before the reoccupation of Milan, but ultimately, after vain attempts to maintain the insurrection in the mountain districts, found it necessary to retire to Lugano. In the beginning of the following year he was nominated a member of the short-lived government of Tuscany formed after the flight of the grand duke, and almost simultaneously, when Rome had, in consequence of the withdrawal of Pius IX., been proclaimed a republic, he was declared a member of the constituent assembly there. A month afterward Mazzini was appointed a member of the triumvirate, with supreme executive power. His tenure of supreme authority was marked by wisdom, moderation, and success. On the surrender of Rome, by Mazzini's advice, however, he quitted the city, and subsequently returned to London. At his instigation risings in Milan (1853) and in Piedmont (1857) were attempted. The Sicilian expedition of 1860 owed as much to the organization of Mazzini as to the command of Garibaldi. In 1865 he was elected by Messina deputy to the Italian Parliament ; but the election, to which he himself as a republican would have declined to accede, was canceled by the parliament. In 1865, after the cession of Venice to Italy, his sentence of death was at last removed, but he declined to accept such an "offer of oblivion and pardon for having loved Italy above all earthly things." In 1870 he set out for Sicily, but was arrested at sea and carried to Gaeta, where he was imprisoned for two months. Events soon made it

evident that there was little danger to fear from a contemplated rising, and the occasion of the birth of a prince was seized for restoring him to liberty. The remainder of his life, spent partly in London and partly at Lugano, presents no noteworthy incidents. For some time his health had been far from satisfactory, and he died at Pisa, March 10, 1872. The Italian Parliament by a unanimous vote expressed the national sorrow ; an eloquent tribute was pronounced by the president, and a public funeral took place at Pisa, his remains being later conveyed to Genoa. Mazzini said of himself, "I am but a voice crying *action*," but he was in very deed far more. In his *Duties of Man*, addressed to working men, he gives perhaps the fullest expression to thoughts which make many consider him the greatest prophet of the nineteenth century. His watch-words were "duties," and not "rights ;" self-sacrifice, and not self-seeking ; association, and not competition ; democracy, and not government ; humanity, and not the individual ; God, and not the opinions of mankind. Opposing both socialism and Christianity as they were presented to him, he said :

"Working men, brothers! When Christ came and changed the face of the world, He spoke not of rights to the rich, who needed not to achieve them ; nor to the poor, who would doubtless have abused them, in imitation of the rich ; He spoke not of utility, nor of interest, to a people whom interest and utility had corrupted ; He spoke of duty, He spoke of love, of sacrifice, and of faith ; and He said that they should be first among all who had contributed most by their labor to the good of all. And the word of Christ breathed in the ear of a society in which all true life was extinct, recalled it to existence, conquered the millions, conquered the world, and caused the education of the human race to ascend one degree on the scale of progress."

References: a translation of his main writings appeared in 1891. There are cheap editions of his *Duties of Man*, of his *Thoughts on Democracy in Europe*, and his literary essays.

McBRIDE, JOHN, was born in Wayne County, O., in 1854, and commenced working in the mines at the age of nine. In 1870 he joined the Miners' Union, and in 1883 was elected its president. In 1881 he was nominated to the State Legislature, and tho defeated, he was renominated, and elected in 1883 and again in 1885. In 1886 he was Democratic candidate for Secretary of State. In 1894 he was elected president of the American Federation of Labor (*q. v.*), but defeated in 1895.

McCULLOCH, JOHN RAMSAY, was born at Whithorn, Scotland, in 1789. He became editor of *The Scotsman*, a Liberal organ, and one of the editors of *The Edinburgh Review*. He wrote the article on political economy in the supplement to the *Encyclopædia Britannica* (1824), and expanded it in 1825 into the *Principles of Political Economy, with a Sketch of the Rise and Progress of the Science*. From 1828-32 he was professor of that science in the University of London. In 1838 he was comptroller of the royal stationary office, and received a pension of £200. He died at Westminster in 1864. One of the first to develop free trade views, his writings were constant. His *Dictionary, Practical, Theoretical and*

Historical, of Commerce and Commercial Navigation (1832) and a *Dictionary, Geographical, Statistical, Historical, of the Various Countries, Places, and Principal Natural Objects of the World* (1841, revised edition, 1866-67), were long standard authorities.

MacDONALD, ALEXANDER, was born in 1821 in Lanarkshire, the son of a miner, and worked in the pit at the age of eight years. Having an ardent desire for education, he prepared himself for Glasgow University, which he entered in 1846, working as a miner in the summer. He became a leader of the miners all over Scotland. In 1850 he became a school-teacher, but in 1857 gave this up to give all his time to agitation on behalf of the miners. In 1863, on the formation of the National Union of Miners, he was elected president. Meanwhile, by some commercial speculations he acquired a modest fortune, which enabled him to devote all his time to advocating a parliamentary program among the miners. In the general election for 1874 he was returned to Parliament for Stafford with Mr. Bright (*q.v.*), the first labor member. He was appointed on the Royal Commission on Labor Laws, and brought in a minority report. He died in 1881.

McGLYNN, EDWARD, was born in New York City in 1837. He was educated at the College of the Propaganda in Rome, and, entering the Roman Catholic priesthood, became in 1866 pastor of St. Stephen's Church, in New York City, where he rapidly gained influence and popularity. His opposition to the establishment of parochial schools and his advocacy of the land doctrines of Henry George (*q.v.*) brought him into disfavor with the Church, and he was summoned to Rome, and, on refusing to go, excommunicated. In 1887 he aided in founding the Anti-Poverty Society (*q.v.*) and became its president, lecturing on its principles before enthusiastic audiences in New York City and elsewhere. In 1893 he was reconciled to the Church, tho without renouncing his economic views; the ban of excommunication was removed, and he was restored to his rank and to office in the Church.

McGUIRE, PETER J., was born in New York City in 1852, of Irish parentage. He was educated in the public schools and in evening classes at the Cooper Institute, and in 1867 apprenticed as a wood joiner. He joined the union of his craft in 1872, and interested himself in the labor movement. In 1880 he secured the passage of labor bills in Missouri and organized the labor bureau of that State. He became a Green-backer in 1876 and stumped Missouri in 1880. In 1881 he organized the Brotherhood of Carpenters and Joiners (*q.v.*). He was arrested that year for conspiracy, but was acquitted. In 1881 he was delegate to the International Working Men's Congress in Switzerland, and studied industrial conditions in Europe. Since 1882 he has been general secretary of the Brotherhood of Carpenters; he has addressed many thousand meetings in all portions of the United States. He is First Vice-President of the American Federation of Labor, and for four years was its secretary.

McNEILL, GEORGE E., was born in Amesbury, Mass., August 4, 1836, his father being one of the early workers in the anti-slavery movement, a friend of John G. Whittier and others. The son worked as a boy in the woolen mills of his native town, and took part in the strike of 1851. Soon after he learned the shoemaker's trade, and in 1856 settled in Boston. About this time he joined the Sons of Temperance, and filled high office many times. He was an active member of the great Eight Hour League, and, with Ira Steward and others, had much to do with the establishment of the ten-hour law of Massachusetts. He founded the Working Men's Institute, and received the cooperation of Wendell Phillips, Governor Claffin, and others in the movement to establish the Massachusetts Bureau of Statistics of Labor, the first labor bureau. Upon the organization of the bureau he was made deputy chief. (See LABOR BUREAUS, also SAVINGS BANKS.) He was president of the famous Boston Eight-Hour League for eight years. (See SHORT-HOUR MOVEMENT.)

He joined the Sovereigns of Industry, and became State secretary. Upon the formation of the International Labor Union of America he was made president, and in that capacity addressed public meetings all over the United States. In Chicago he addressed an immense gathering of over 13,000 people, the labor societies having challenged Joseph Cook to meet him in debate. He was connected as editor and associate editor with the *New York Labor Standard*, *Fall River Labor Standard*, *Pater-son (N. J.) Labor Standard*, *Paterson Home Journal*, and *The Voice* (Boston). He founded the *Labor Leader* at Boston. He was an active member of the Labor Congress at Rochester in 1874, and there wrote a declaration of principles since adopted by the Knights of Labor (*q.v.*).

He served for a time as a member of the school committee of the city of Cambridge, Mass., and succeeded in establishing free evening drawing schools, the first attempt of the kind. He joined the Knights of Labor in 1883; became prominent in District 30 of that order, when District 30 was the largest district of the largest labor organization that had ever existed up to that time. He was appointed district treasurer in 1884. He has been successful as an arbitrator of differences between employers and employees; notably in the great horse-car strike in Boston, 1885, and in the case of the employees of the Union Pacific Railroad. In 1886 he was the working men's candidate for mayor of Boston. The first systematic history of the labor movement in America was undertaken by McNeill, resulting in the publication of *The Labor Movement, or the Problem of To-day*, in 1886, edited and the larger portion written by himself. He was appointed by the Governor of Massachusetts one of the Commissioners of Manual Training (1892). Driven in his early years, by what he considered the infidelity of the Church, into unbelief, he was later in life confirmed in the Protestant Episcopal Church, and became, in 1891, senior warden of the Episcopal, Christian Socialist Church of the Carpenter in Boston. (See BLISS.) Mr. McNeill is intensely democratic in

his views, and when the Knights of Labor (*q. v.*) developed too centralized a policy, and refused to recognize the autonomy of the separate crafts, he strenuously opposed the policy, and failing to convince the leaders of that organization of their mistake, he became one of the main supporters of the American Federation of Labor (*q. v.*). His economic views are those of the short-hour philosophy, of which he was one of the prime founders. (See *SHORT-HOUR MOVEMENT*.)

MENNONITES are a sect of Anabaptists (*q. v.*), followers of Menno Simons, and found in Switzerland, Germany, France, Russia, and America. First appearing in Switzerland in 1525, in 1683 a colony was established at Germantown, Pa. In 1871 many of them fled from Russia to America. In 1890 there were 41,541 in the United States. At first they refused to swear in courts or bear arms, and lived a quiet industrial life. They have now abandoned any unusual social views. (See *ANABAPTISTS*.)

MERCANTILISTS.—Mercantilists is the name given to the school of political economy, if it can be called a school, which advocated the belief generally held till the end of the last century that wealth consists in gold and silver, and that therefore the importation of gold and silver and exportation of goods to obtain gold should be encouraged by the State, and the exportation of gold and silver and importation of goods should be discouraged as much as possible. How this leads to the balance of trade theory (*q. v.*) is at once apparent.

The mercantile system, also called Colbertism, restrictive system, and commercial system, obtained from the early part of the sixteenth century until late in the eighteenth century, and its influence is still felt. Most prominent among the statesmen who were mercantilists may be named Colbert, of France; Frederick the Great, of Prussia; and Cromwell, of England. Serra, an Italian, early in the seventeenth century presented a moderate and systematic statement of their views in a work entitled *A Brief Treatise on Causes which make Gold and Silver Abound where there are no Mines*. Thomas Mun, in England, a generation later, wrote a valuable treatise from the standpoint of the mercantilists, called *England's Treasure by Foreign Trade; or, the Balance of our Trade the Rule of our Treasure*, while Sir James Steuart's *Inquiries into the Principles of Political Economy*, published in 1767, may be regarded as closing the development of the theory of mercantilism. The one idea common to all was that a nation ought to strive to export a quantity of goods of greater value than it imports, in order that the difference may be imported in gold and silver and the home supply of the precious metals increased. Everything else was subordinated to this policy. A favorable balance of trade was the aim. Tariffs were laid with this in view, and protectionism was encouraged; yet it was something different from modern protectionism. It was the avowed aim of the mercantilists to make both agricultural products and labor cheap, in order that manufactured articles might be cheap and a large

sale of them abroad effected. The exportation of raw material was often entirely prohibited. To-day no one holds this view to be correct. (See *BALANCE OF TRADE; FREE TRADE; PROTECTION*.)

MERCHANTS' GUILDS. See *GUILDS*.

METAYER, THE (from Latin *medieta, half*) is one who cultivates a farm or land for the owner on condition of retaining a portion, usually one half, of the produce, the owner generally furnishing the stock and tools. *Metayage*, or the metayer system, prevails in Italy, Southern France, and to a large extent in the south of the United States. J. S. Mill says (*Political Economy*, vol. ii., chap. viii.):

"The metayer system has met with no mercy from English authorities. 'There is not one word to be said in favor of the practice,' says Arthur Young, 'and a thousand arguments that might be used against it. The hard plea of necessity can alone be urged in its favor; the poverty of the farmers being so great, that the landlord must stock the farm, or it could not be stocked at all: this is a most cruel burden to a proprietor, who is thus obliged to run much of the hazard of farming in the most dangerous of all methods, that of trusting his property absolutely in the hands of people who are generally ignorant, many careless, and some undoubtedly wicked. . . . In this most miserable of all the modes of letting land, the defrauded landlord receives a contemptible rent; the farmer is in the lowest state of poverty; the land is miserably cultivated; and the nation suffers as severely as the parties themselves. . . . Wherever this system prevails, it may be taken for granted that a useless and miserable population is found. . . . There are but few districts' (in Italy) 'where lands are let to the occupying tenant at a money-rent; but wherever it is found, their crops are greater—a clear proof of the imbecility of the metaying system.' 'Wherever it' (the metayer system) 'has been adopted,' says Mr. McCulloch, 'it has put a stop to all improvement, and has reduced the cultivators to the most abject poverty.' Mr. Jones shares the common opinion, and quotes Turgot and Destutt-Tracy in support of it. The impression, however, of all these writers (notwithstanding Arthur Young's occasional references to Italy) seems to be chiefly derived from France, and France before the Revolution. . . .

"We shall find a very different picture, by the most accurate authorities, of the metayer cultivation of Italy. In the first place, as to subdivision. In Lombardy, according to Châteaueuvieux, there are few farms which exceed 60 acres, and few which have less than 10. These farms are all occupied by metayers at half profit. They invariably display 'an extent and a richness in buildings rarely known in any other country in Europe.' Their plan 'affords the greatest room with the least extent of building; is best adapted to arrange and secure the crop; and is, at the same time, the most economical, and the least exposed to accidents by fire.' The court-yard 'exhibits a whole so regular and commodious, and a system of such care and good order, that our dirty and ill-arranged farms can convey no adequate idea of.' The same description applies to Piedmont."

METHODISM AND SOCIAL REFORM.

—John Wesley, the founder of Methodism, was not less remarkable as a social reformer than as a preacher and administrator. His conception of the Gospel of Christ was that it is not only the indispensable and sufficient evangel for the individual soul, but also the only and efficient remedy for social sins and sufferings. He early combined an active philanthropy with his zealous evangelism. He saw in every man a brother, and the wrongs and needs of man everywhere aroused his compassion and called forth his practical sympathy. He regarded the physical and intellectual as well as the spiritual necessities of his fellows, and laboriously and unsparingly, in the spirit of Christ, set himself

to minister unto them. In fact, it is difficult to find any religious or social enterprise of the Christian Church which was not anticipated by Wesley.

It is believed that the first free dispensary in the world was founded by John Wesley, at the old Foundry in Moorfields, London. The first tract society was formed by Wesley and Dr. Thomas Coke in 1782, 17 years before the organization of the great and noble Religious Tract Society, a society which itself owed its origin chiefly to Rowland Hill and other (Calvinistic) Methodists. The Strangers' Friend Society, visiting 50,000 of the sick and poor of London annually, without regard to creed, was founded by Methodists six years before the death of Wesley. Similar benevolent and strangers' friend societies are sustained by Methodists in most of the large towns and cities of England.

It was Sophia Cooke, a Methodist, afterward the wife of the eloquent Samuel Bradburn, who first suggested to Robert Raikes the Sunday-school idea, "and actually marched with him at the head of his troop of ragged urchins the first Sunday they were taken to the parish church."*

Wesley and his preachers were enthusiastic and active in the use of the press and the circulation of improving and wholesome literature. The oldest periodical magazine in the world is the *Arminian Magazine*, now known as the *Wesleyan Methodist Magazine*, which was first issued January 1, 1778, and is now in the one hundred and sixteenth year of its continuous existence.

Wesley's contributions to what in the best sense was popular literature awaken our wonder and admiration for his literary ability and tireless industry. His pen and tongue were alike constantly employed for the public good. His Christian Library in 50 volumes, the first volume of which was printed in 1749, was an effort to bring to the common people some of the treasures of literature, otherwise inaccessible to them. In all his multifarious and incessant labors Wesley sought no personal gain, but worked, as he lived, for his fellow-men.

Dr. Abel Stevens writes :

"Wesley was the first to set the example of modern cheap prices sustained by large sales. A catalog of his publications, printed about 1756, contains no less than 181 articles in prose and verse, English and Latin, on grammar, logic, medicine, music, poetry, theology, and philosophy. Two thirds of these publications were for sale at less than one shilling each, and more than one fourth at a penny. They were thus brought within the reach of the poorest of his people. 'Simplify religion and every part of learning,' he wrote to Benson, who was the earliest of his preachers addicted to literary labors. To all his preachers he said: 'See that every society is supplied with books,' some of which ought to be in every house."

Methodism in both hemispheres is still active in the work of publishing and circulating good literature. While accomplishing this end the profits are not applied to any private emolument, but distributed among the aged and superannuated ministers and widows of ministers.

The Methodist Book Concern, in New York, is the greatest religious publishing agency in

the world. Its sales of books in 1893 amounted to \$463,913. British Methodism has a vigorous and successful publishing house, which is the legal and lineal heir and successor of John Wesley in this beneficent work. Every Methodist minister has always been everywhere an active agent for the dissemination of the best literature among the people. No less than 3,624,350 copies of magazines, newspapers, and periodicals were issued by the Book Committee of the Methodist Episcopal Church in 1893. The larger part of these issues were distinctly educational, for use in Sunday-schools. The sales of books reached nearly \$464,000 for the year.

Methodism has largely caught the spirit and been influenced by the genius and example of its founder. Its territory is so vast and its branches are so numerous that it is impossible to catalog and describe all its activities in the direction of what is known as social reform.

The missionary work of the Church is by no means wholly foreign. Forty-five per cent. of the income of the Methodist Episcopal Church Missionary Society is expended in the United States—much of it among the foreign-born peoples. Thus, in 1893, while \$568,884 was appropriated to foreign missions, \$474,952 was expended at home.

Wesleyan Methodism, the older of the two great wings of the Methodist Church and the parent of all, expends much time and money in distinctively home missionary work. Around all these domestic centers and agents cluster schools, libraries, charities, classes for manual training, savings banks, mothers' meetings, sick clubs, etc. Classes for "sloyd" (sewing) and the teaching of useful arts and knowledge are held in connection with most city missions.

The foreign missionary work of Methodism involves an immense expenditure of money and most self-sacrificing labor in (so-called) "humanitarian" work; improving the temporal, physical, and social condition of the people, including the care of the sick and orphans, with hospitals and skilled medical service. A vast amount of educational work, with the translation, printing, and publication of literature, is also done by missionaries.

Temperance is practised and advocated as an integral part of Christian duty and character. Wesleyan Methodism has its Conference Temperance Committee, with a minister set apart to superintend temperance work throughout its jurisdiction. So also have the United Methodist Free Churches. The other branches of Methodism in Great Britain and her colonies have special organization for this work. In the United Kingdom the work is generally prosecuted by means of Bands of Hope for the children and adult societies for the seniors. In America there is less of special organization; but periodical temperance lessons are given in the Sunday-schools, and temperance work is expressly committed to one department in all chapters of the Epworth League.

The Tract Society of the Methodist Episcopal Church issued 16,250,700 pages in 1893. Two hundred and fifty thousand tracts were printed in the German language, and funds furnished to foreign fields for printing religious literature.

The Board of Church Extension of the Meth-

* Tyerman's *Life of Wesley*, vol. i., p. 11.

odist Episcopal Church has disbursed in 27 years nearly \$5,000,000, aiding the building of 9083 churches in various States and Territories. One third of this amount has been supplied as loans, to be repaid, thus constituting a fund which can be used again and again for the same purpose.

In 1866 the Freedmen's Aid Society was organized, and in 27 years it has disbursed \$3,667,162. It is now known as the Freedmen's Aid and Southern Education Society, and in 1893 expended \$363,763 in schools among the freedmen and necessitous whites of the South.

Activities. The Board of Education aided 1416 students in the year ending July, 1893. All these students were intended for the ministry, missionary, teaching, or similar work. Within the last nine years a remarkable movement in social effort has been seen in the rise and development of the deaconess movement. The work began informally in Chicago in 1887, where Mrs. Lucy Rider Meyer had instituted a Missionary Training School. In 1888 the General Conference gave formal recognition and authorization to deaconesses. Deaconesses must be trained; work entirely voluntarily, taking no vows; wear a simple costume; are entirely unsalaried in nearly all cases; live usually in communities called "homes;" are individually recognized by the Church, and must be yearly approved by the Annual Conference within whose bounds they labor.

Eight hospitals have been established in connection with the deaconess homes, and many deaconesses are trained nurses.

In the foreign work the deaconess movement has been found most helpful, especially in India and China. In Germany there is a large deaconess work, having headquarters at Hamburg, where there is a fine large home and hospital. The Methodist Episcopal Church has about 500 deaconesses. In England, the deaconess movement has also become a permanent institution, and promises to aid materially in solving the problem of reaching and aiding the poor and in winning their confidence.

The Methodist Church has always taken an interest in the condition of poor, orphan, and neglected children. The Children's Home, with headquarters in London and a distributing home at Hamilton, Can., cares for nearly 1000 boys and girls. St. Christopher's Home, New York, has five cottages accommodating 125 children. The Fred Finch Orphanage (Oakland, Cal.) provides for 60 boys and girls. New York has a home for aged and infirm persons, accommodating 109 inmates. Brooklyn has a similar institution with 52 inmates.

At the Methodist Hospital, Brooklyn, 897 patients occupied beds in 1893, and nearly 600 out-patients were treated. This hospital has an estate and buildings which have already cost \$750,000. It has also an endowment fund of upward of \$195,000. During the past six years it has cared for about 10,000 people, at a cost of nearly \$195,000. These patients have been of all creeds and nationalities.

The Methodists have also hospitals at Philadelphia, with 70 beds; Cincinnati, where 233 patients were treated in 1893; Chicago, with a

training school for nurses; Kansas City; Omaha, accommodating 28 patients; St. Louis; Portland, Ore., where 276 patients were treated last year.

At East Boston, right opposite the Cunard wharf, is the Immigrants' Home. The report of a year's work includes: Trains and steamers met, 74; cared for in the home, 661; aided on piers and to find friends, 350; helped to employment, over 100; lodgings furnished, 2588; meals supplied, 7764; 465 lodgings and 1294 meals were given free.

New York Methodism has also a work among immigrants landing at that port.

In the practical activities which are now regarded as the legitimate sphere and the positive duty of the Christian Church, Methodism is everywhere taking its full share. Especially is this evidenced in the constitution and work of the Epworth League, in which thousands of the earnest and educated young people are enrolled. In every chapter of the League the Department of Mercy and Help is especially charged with the consideration and direction of systematic effort in all lines of social reform.

In the city of Boston an excellent work is being carried on at the Epworth Settlement. In a house at the North End certain university students have taken up residence, and, aided by voluntary workers, devote themselves to the service of the people. The Italians have been helped in resisting the unprincipled Italian bosses, and are being taught to be loyal citizens. Boys' and girls' clubs, classes for sewing, physical culture, night schools for Italians, Jews, Portuguese, and others are among the many activities of the settlement. Thirty-six college students are pledged to this good work.

The attitude and testimony of the Methodist Church against the liquor traffic, gambling, polygamy, the evils of divorce, the opium traffic, and the licensing of vice are too well known to require description.

JAMES YEAMES.

MICHAELIS, OTTO, was born at Lubeck, in Westphalia, in 1826. He studied law at Bonn and Berlin, but was deprived of his position in consequence of the excitements of 1848. He then betook himself to Berlin, where he became assistant editor of the *Abendzeitung*, and, after its suppression, editor of the *Nationalzeitung*. In 1861 he was elected to the Prussian House of Deputies, and in 1867 to the North German Reichstag. He held several political posts, but as his free-trade principles brought him into conflict with the financial policy of the Government, he retired. He died December 12, 1890.

MICHEL, LOUISE, was born at Veoncourt, Haute-Marne, France, in 1839. Winning distinction by musical and poetical talents, she opened a school at Montmartre, Paris, in 1860, but early became an active revolutionist. During the Commune she worked on committees and fought at barricades in man's uniform. She was captured and condemned to death, a sentence changed to transportation. She went through all the horrors of the Versailles prisons, and was transported to New Caledonia. After nine years the amnesty allowed her to return,

a more determined anarchist than ever. Several times imprisoned, she escaped to London, and started an international school in Fitzroy Street. Often addressing Hyde Park meetings, she vents, in vehement French, her hatred of the bourgeoisie, who shed the blood of her comrades. She has written her *Memoirs* and a novel, *The Microbes of Society*.

MIDDLE AGES.—The Middle Ages, which are usually made to reach from about the fifth century to the thirteenth, form a period of great economic and sociologic importance and interest. Under a separate head we treat of FEUDALISM. (See also CHRISTIANITY AND SOCIAL REFORM; CHURCH AND SOCIAL REFORM; GUILDS; CITIES; CANON LAW; LAND; MONASTICISM; EDUCATION; FAMILY; SERFDOM; SLAVERY; WOMAN, etc.) Dr. Ingram, in his *History of Political Economy*, says of the Middle Ages:

"They represent a vast transition, in which the germs of a new world were deposited, but in which little was fully elaborated. There is scarcely anything in the later movement of European society which we do not find there, tho as yet, for the most part, crude and undeveloped. The mediæval period was the object of contemptuous depreciation on the part of the liberal schools of the last century, principally because it contributed so little to literature. But there are things more important to mankind than literature; and the great men of the Middle Ages had enough to do in other fields to occupy their utmost energies. The development of the Catholic institutions and the gradual establishment and maintenance of a settled order after the dissolution of the Western empire absorbed the powers of the thinkers and practical men of several centuries. The first mediæval phase, from the commencement of the fifth century to the end of the seventh, was occupied with the painful and stormy struggle toward the foundation of the new ecclesiastical and civil system; three more centuries were filled with the work of its consolidation and defense against the assaults of nomad populations; only in the final phase, during the eleventh, twelfth, and thirteenth centuries, when the unity of the West was founded by the collective action against impending Moslem invasion, did it enjoy a sufficiently secure and stable existence to exhibit its essential character and produce its noblest personal types. The elaboration of feudalism was, indeed, in progress during the whole period, showing itself in the decomposition of power and the hierarchical subordination of its several grades, the movement being only temporarily suspended in the second phase by the salutary dictatorship of Charlemagne. But not before the first century of the last phase was the feudal system fully constituted. In like manner, only in the final phase could the effort of Catholicism after a universal discipline be carried out on the great scale—an effort forever admirable, tho on the whole unsuccessful.

No large or varied economic activity was possible under the full ascendancy of feudalism. That organization, as has been abundantly shown by philosophical historians, was indispensable for the preservation of order and for public defense, and contributed important elements to general civilization. But while recognizing it as opportune and relatively beneficent, we must not expect from it advantages inconsistent with its essential nature and historical office. The class which predominated in it was not sympathetic with industry, and held the handicrafts in contempt, except those subservient to war or rural sports. The whole practical life of the society was founded on territorial property; the wealth of the lord consisted in the produce of his lands and the dues paid to him in kind; this wealth was spent in supporting a body of retainers whose services were repaid by their maintenance. There could be little room for manufactures, and less for commerce; and agriculture was carried on with a view to the wants of the family, or at most of the immediate neighborhood, not to those of a wider market. The economy of the period was therefore simple, and, in the absence of special motors from without, unprogressive."

Economy.

Perhaps the first great fact of the Middle

Ages, viewed from the standpoint of social development, was its lawlessness. The monasteries afforded to an extent asylums of peace; benevolent monarchs and prosperous cities created some order; religion, as in the establishment of the days called "the Peace of God"—days when war and strife were to be laid aside—to some degree restrained violence; but these very restraints and exceptions show to what an extent lawlessness was the rule. With this reign of violence went, as a necessary result, neglect of agriculture, of commerce, and to a less extent of industry. In the latter Middle Ages city industries grew rapidly and reached heights of artistic development and of honorable esteem not equaled before or since. But agricultural labor through all the Middle Ages and city labor in the early Middle Ages were neglected because unsafe.

From this resulted a lack, even among the well-to-do, sometimes even of food, and always of the comforts of life. The poor to-day can have what rich men could not in the Middle Ages. Lack of communication and the absence of printing, too, must be noted as among the great distinguishing marks of the Middle Ages. Immorality was all but universal, limited only by the saintly lives of a few priests and monks and nuns, and by a somewhat fanciful code of knightly honor and commercial fairness. Lecky says (*History of Morals*, vol. ii., chap. v.): "Ecclesiastical immorality in the eighth and three following centuries was little if at all less outrageous than in any other period, while the papacy during almost the whole of the tenth century was held by men of infamous lives. Simony was nearly universal."

Yet there is a favorable side to mediæval life. The very rudeness of the age developed idealism. When the possibilities of knowledge were limited to the few; when material interests and distractions were not many, the faculty of the imagination had large scope. This led undoubtedly, as above stated, to gross credulity and superstition, and gave great power to the clergy, but it also led to chivalry and romance and faith. It produced the cathedral and the cathedral life. Chivalry with its largely pure, tho in part impure and unworthy, worship of woman is characteristic of the age. Commercial vices were not common. Commercial virtues were much praised. Town authorities ruled the market, enforced honest work and fair prices. It was the honor of the strong to protect the weak, even as it was their glory to attack and defeat other strong men. Paternalism went hand in hand with the tyranny of feudalism. In some lords the one was most prominent; in others the other. The poor had a claim upon the great. Each man could have a home, if it were a hovel, and, save for war, security in his home. The recognition of classes involved the duties of classes. "Each for self" was by no means a mediæval ideal.

We discover, too, a movement in the Middle Ages. Modern Europe may be said to have been born of the Crusades. They did much to make Europe **Crusades.** one. They brought the martial Goth into connection with the refined Byzantine and the quick-witted Greek.

They developed great cities like Venice and Genoa. They taught Europe to worship an idea.

The age-long battle, too, between Emperor and Pope drew Europe into international communion. It led to the ideal unity of the Holy Roman Empire, which if it was, as has been said, neither holy nor Roman, was at least imperial, and therefore stood for organic union and not for anarchistic strife. The battle, too, between contending claims developed political thought. Almost all modern political and social ideas find their germs in the contests of ideas in the Middle Ages. As men fought for private right or public law, for local government or imperial will, for power of king or right of priest, they broke up a dead system of a great Church State, and prepared the way for the doctrines of the Reformation and the rights of man.

MIDDLE-MAN.—The middle-man, who buys of the producer and sells to the consumer, and retains his profit on the transaction, is usually denounced as an unnecessary source of cost to the consumer. Cooperation (*q.v.*) tries in various ways to eliminate that cost, but often his work is of absolute value. The work of collecting and ordering products for consumers, and especially of deciding what to order and what to sell, is often of the very greatest importance and value. If not performed by a middle-man who takes his profit, it would often have to be performed by some salaried agent or employee, either of the producers or consumers. (See WAGES OF SUPERINTENDENCE.)

MILITIA (from Latin *miles*, a soldier) is that portion of the military strength of a nation enrolled for discipline and practice, but local in organization, and only called into actual service when necessary. It is the organized national reserve, and includes the "voluntary" organizations of Great Britain and the United States, the National Guard of France, and the Landwehr and Landsturm of Germany. The British system of volunteers originated in the old Anglo-Saxon *fyrð*, and the warlike features of the ancient *posse comitatus*. The British Government appoints lord-lieutenants of counties empowered to command voluntary organizations or to place a levy by ballot upon all non-exempted persons. As a matter of fact, the volunteers are usually sufficient. The militia of the United Kingdom in 1893-94 comprised 140,308 men, or, including the whole national reserve, 274,549.

In the United States the militia is under the control of Congress in time of war, and in time of peace under the States subject, however, to the consent and general control of Congress. As a matter of fact the only effective militia are the unformed voluntary organizations maintained in many of the States as National or State Guards.

In the War of the Revolution there were 231,971 continentals or regulars and 56,163 militia. In the War of the Rebellion there were received into service 2,690,401 men; when hostilities ceased there were 1,000,516 men in service, of whom 978,000 were volunteers, and the national enrollment at the same time exhibited an available reserve of 2,254,063 men. January 1,

1895. the militia of the United States numbered 114,146, exclusive of naval reserves—the naval militia numbering 2695. Those liable to military duty numbered 10,180,043.

MILK SUPPLY SERVICE, MUNICIPALIZATION OF THE.—*The New Nation*, the former organ of the Nationalists (*q.v.*) in the United States, argued that one of the businesses in which municipal management ought immediately to be introduced, in place of private competition, is the milk supply. It considered this even more important than the municipalization of the gas supply. It says:

"Not only would the management of the milk supply by the municipality cheapen the cost of milk both by dispensing with profit and by avoiding the great waste by duplication of routes and service, which marks the present competitive system, but it would have another advantageous result far more important than this, namely, the prevention of adulteration.

"It is notorious that there is scarcely any article of food which is so commonly adulterated as milk, and this common repute is abundantly justified by official and statistical records. For example, a late report of the Massachusetts inspector of milk and vinegar states that samples of the milk sold at the lunch counters and restaurants of Boston prove in many cases to be of the poorest grade. They are largely skimmed milk and often diluted at that with 40 per cent of water. It is often found, moreover, that in order to correct the blue tint caused by pouring too much water into skimmed milk, a chemical called annatto is added. Such milk is sold at 5 cents a glass or 20 cents a quart, when 8 cents a quart is all that good milk should bring. The worst of it is the most of this bad milk is sold to the poorer classes, who can least afford to be cheated. On the other hand, however, the inspector found that quite a number of the high-priced and fashionable restaurants were not above practising the same vile sort of fraud.

"On the whole, perhaps the worst aspect of this milk iniquity is the fact that infants and children, who depend largely and often wholly upon milk for subsistence, are the chief sufferers from the adulterations practised. There is no doctor who has any practice in the tenement-house districts who will not say that the terrible prevalence of cholera infantum, as well as children's diseases in general in those quarters, is owing largely to the bad milk the poor have to use. When it is a question of milk for infants, it must be remembered, moreover, that in order not to be injurious and even fatal to a feeble child, it must be, not merely free from actual adulteration, but of a certain degree of freshness. This last is a condition absolutely unattainable to the poor, who have in Boston, as a rule, to put up with milk not less than 72 hours from the cow. By tolerating the present system of milk distribution, the State becomes an accomplice in wholesale child-murder.

"A further advantage of a municipal milk supply would be the prevention of the sale of milk from infected cattle."

MILL, JAMES, was born near Montrose, Scotland, in 1773, and educated at the University of Edinburgh. He was licensed as a preacher in the Scottish National Church in 1798; but, changing his religious views, became a tutor in the family of Sir John Stuart, and accompanied him to London in 1802 to begin a literary life.

His first venture was to start a periodical on a new plan, entitled *The Literary Journal*, which began in January, 1803, and continued under his editorship till the end of 1806.

In 1806 he commenced his *History of British India*, which he carried on along with other literary work, and published in the winter of 1817-18. The impression produced by this history was such that, in 1819, he was appointed to the post of assistant examiner of Indian corre-

spondence, notwithstanding the unpopularity of his well-known radical opinions. The business assigned to his care was the revenue department, which he continued to superintend till four years before his death, when he was appointed head of the examiner's office, where he had the control of all the departments of Indian administration—political, judicial, and financial—managed by the secret committee of the court of directors. Shortly after his appointment to the India House he contributed the articles on government, education, jurisprudence, law of nations, liberty of the press, colonies, and prison discipline to the *Encyclopædia Britannica*. In 1821–22 he published his *Elements of Political Economy*, a work prepared primarily with a view to the education of his son, John Stuart Mill.

In 1808 he became acquainted with Jeremy Bentham, and was for many years Bentham's chief companion and ally. He was not, however, a mere disciple of Bentham, but a man of profound and original thought and learned in all the departments of philosophy. He contributed largely to the *Westminster Review*, and in 1829 published *An Analysis of the Phenomena of the Human Mind*, and gave a powerful intellectual stimulus to a number of young men. Between 1806 and 1818 he wrote a great many articles for various periodicals, his principal topics being education, reform, freedom of the press, prison discipline. In 1836 he died at Kensington.

MILL, JOHN STUART, was born in London in 1806, the son of the Benthamite philosopher, James Mill (*q.v.*). Educated by his father, he showed phenomenal precociousness, tho subjected to the strictest mental discipline. He is said to have begun Greek at the age of three, and by the age of 12 to have read most of the leading Greek and Latin authors. He also at this age studied calculus and the sciences, and at the age of 14 he took a complete course in political economy. He then had a year's travel in Europe, mainly in Southern France, and returned to aid his father in literary work, imbibing his father's liberalism and skepticism. He studied law with John Austin, another Benthamite. In 1823 he became a clerk in the India House, and remained in this house 37 years, rising from grade to grade. The influential *Westminster Review* was established in 1823 as a Benthamite organ, and Mill began contributing to it at once. In 1843 he published his *Logic* in two volumes; in 1844, his essays on *Some Unsettled Questions of Political Economy*; and in 1848, his *Principles of Political Economy, with some of their Applications to Social Philosophy*, an epoch-making book. In it political economy is no longer "the dismal science" of cold theory, but the practical study how to cure economic evils; tho on the whole of the orthodox school, it is, nevertheless, progressive. In 1859 he published his *Liberty*, and also *Thoughts on Parliamentary Reform*; his *Representative Government* appeared in 1861, and *Utilitarianism* in 1862. His *Subjection of Women* was Mill's next work, tho not published till 1869. In 1865 appeared his *Examination of Hamilton's Philosophy*. The same

year he was elected to Parliament for Westminster, tho he refused to make any canvass for the office. His parliamentary career, however, was short and not marked. His subscription to the election expenses of Mr. Bradlaugh and other independent acts cost him his seat in 1868, and he retired to literary life at Avignon. Here he wrote many articles and essays, and for his last public work was engaged in the starting of the Land Tenure Reform Association. In 1851 he married Mrs. John Taylor, whom he had met in 1831, and with whom he had shared his literary work in the closest friendship. She died, however, in 1859, and after her death her daughter, Miss Taylor, became his constant companion. His *Autobiography* appeared in 1873, and created great interest; and in it Mill relates, step by step, the development of his views. Beginning as a Benthamite, and working for the utilitarian greatest good of the greatest number, in the autumn of 1826, he tells us, he suddenly asked himself the following question: "Suppose that all your objects in life were realized; that all the changes in institutions and opinions which you are looking forward to could be completely effected at this very instant—would this be a great joy and happiness to you? and an irrepressible self-consciousness distinctly answered No! At this my heart sank within me. The whole foundation on which my life was constructed fell down." From that change he went on, he tells us, to materially change his views. He adopted what he later found was Carlyle's anti-self-consciousness theory, of happiness not as an end, but to be attained only by having another aim, the happiness of others, or some art, etc. He learned to add the susceptibilities to intellect culture. He came also finally to change his social views to a position where he could say of himself and his wife: "Our ideal of ultimate improvement went far beyond democracy, and would class us decidedly under the general name of socialists. . . . The social problem of the future we considered to be, how to unite the greatest liberty of action with a common ownership in the raw material of the globe, and an equal participation of all the benefits of combined labor" (*Autobiography*, 1873). He died at Avignon in 1873. After his death his essays on socialism were published.

MILLIONAIRES.—(For a discussion of the development and concentration of wealth in the United States and elsewhere, see **WEALTH**.) We give here a summary of the results of the investigation conducted by the *New York Tribune* in 1892 as to the number of millionaires in the United States, and the ways in which their fortunes were obtained :

IN THE UNITED STATES.

Manufacturing mainly, but in many cases with investments in real estate, banking, and other non-protected business.....	619
Saw mills and lumber, sometimes with other investments.....	138
Brewing and real estate, mainly.....	79
Distilling, mainly.....	32
Malting.....	2
Coal, iron, zinc, lead, copper, or quicksilver mines.....	113
Sugar refining, mainly.....	29
Shipbuilding and repairing.....	3

Tanning and leather business..... 46
 Coasting and lake shipping, mainly..... 31
 Flour milling..... 16
 Marble quarries, but with other investments..... 2
 Seeds and nursery business, mainly..... 4
 Sugar plantations in the South..... 3
 Lithographing, but with insurance business in addition..... 1
 Tobacco growing in the South, and lands..... 3
 Wool growing in Ohio, and lands..... 1
 Making special patented and proprietary articles..... 93
 Cattle raising in the West, and lands, mainly..... 47
 Merchandising mainly, with, in the great majority of cases, the investment of profits in real estate, banks, and securities generally..... 986
 Real estate, advance in value with the growth of population and improvement of..... 468
 Loaning money and real estate..... 9
 Railroads, development, consolidation, and management of..... 186
 Contracting and building, railroads, streets, and public and private works generally..... 77
 Banking and the investment of profits in real estate and securities, mainly..... 294
 Brokerage business and stocks..... 56
 Express business..... 18
 Mercantile agency business and investments..... 2
 Telegraph and telephone development..... 12
 Silver and gold mines..... 73
 Local enterprises, gas works, water works, street railroads, ferries, etc..... 70
 Law practice and investment of profits in real estate and securities..... 65
 Deep-sea shipping, ocean freighting, in some cases combined with foreign trade on the owner's account..... 75
 Whaling, deep-sea ships, and ocean trade..... 4
 Packing and provisions..... 34
 Ice business, mainly..... 1
 Oil producing, refining, and transportation..... 72
 Hotel and restaurant business, with real estate investments..... 24
 Pine lands and the sale of logs and timber therefrom..... 19
 Dealing in timber and mineral lands..... 11
 Publishing news and story papers..... 30
 Publishing copyright books, with general printing added in some cases..... 25
 Publishing copyrighted music..... 2
 Steamboating on the rivers and in the harbors..... 20
 Plantations, farming and land..... 15
 Cracker and bread baking..... 4
 Nitrate beds in Chile..... 1
 Louisiana lottery business..... 2
 Main contracts in the West, with other business, ranches, mines, etc..... 1
 Smelting and refining metals..... 6
 Insurance business, mainly..... 6
 Royalties on patents..... 3
 Miscellaneous investment, mostly in non-protected lines of business..... 6
 Show and circus business, with investment of profits in real estate, securities, etc..... 3
 Asphalt street pavements..... 1
 Pension agency business, with a weekly newspaper in connection therewith..... 1
 Contracts for railroad building and equipment, etc., in foreign lands..... 6
 Plantations in the West Indies and South America, mainly..... 6
 Phosphate land in Florida, banking, and real estate..... 1
 Fine stock raising and fortunate investments in lands and securities..... 3
 Grain elevator, storage warehouses, and wharf business..... 17
 Medical practice and investments in real estate... 1
 Unprotected manufacturing..... 1
 Pawnbroking and real estate..... 2
 Refining lard, cotton oil, etc..... 1
 Cotton raising in the South..... 4
 Made in the Tweed Ring, New York City..... 1
 Pony express over the plains, and lands..... 1
 By inheritance and gift, original sources of the fortune unknown..... 34
 Origin of the fortune entirely unknown..... 21

Origin of the fortune entirely unknown..... 21
 In industries not in the least protected..... 2,727
 Grand total..... 4,047

IN NEW YORK CITY.

Manufacturing, mainly..... 95
 Brewing and real estate..... 19
 Distilling, mainly..... 2
 Coasting vessels, mainly..... 19
 Tanning business and leather..... 19
 Sugar refining, mainly..... 13
 Protected mines, coal, iron, etc..... 11
 Shipbuilding and investments..... 1
 Cattle raising in the West, mainly..... 1
 Making patented and proprietary articles..... 18
 Merchandising, with investment of profits in real estate, securities, etc..... 356
 Banking and investments..... 113
 Brokerage business and stocks..... 24
 Real estate, advance in value and improvement of Railroads..... 134
 Silver and gold mines..... 6
 Ocean ships, freighting, and foreign trade..... 37
 Local gas, railroad, ferry, and kindred enterprises..... 10
 Hotel and restaurant business and real estate..... 8
 Insurance business, mainly..... 3
 Contracting and building, mainly..... 16
 Oil refining, production, and transportation..... 17
 Law practice and investments..... 28
 Storage, warehousing, etc..... 3
 Publishing news and story papers..... 12
 Publishing copyrighted books..... 9
 West India and South American plantations, etc..... 5
 Bakery business..... 1
 Medical practice and fortunate real estate investments..... 1
 Mercantile agency business, with investment of profits..... 2
 Tweed Ring..... 1
 River and harbor boats..... 7
 Express business..... 6
 Telegraph and telephone business..... 3
 Ice business, mainly..... 1
 Live-stock raising, with investment of profits..... 1
 Pawnbroking and real estate..... 2
 Inherited from relatives..... 14
 Origin of the fortune entirely unknown..... 6

In protected industries, mainly..... 179
 In cattle raising..... 1
 Patented and proprietary articles..... 18
 Inherited, business in which the fortune was made unknown..... 14
 Origin of the fortune entirely unknown..... 6
 In industries not protected..... 885

Total..... 1,103

The millionaires of Europe have not been thus tabulated. Dr. C. B. Spahr (*Distribution of Wealth*, 1896) estimates for Great Britain that less than 2 per cent. of the families hold about three quarters of the wealth. In Prussia he finds that 10 per cent. of those receiving incomes hold nearly half the wealth. In Paris, 2½ per cent. of the incomes aggregate more than one half of all incomes. (See WEALTH.)

MILLS, HERBERT V., was born in 1856 in Accrington. Apprenticed as an engineer, he left this position and eventually became a Unitarian minister, with a chapel at Hamilton Road, Liverpool, and more recently at Market Place, Kendal. He founded the Home Colonization Society in 1887, and is now a leading director of the Starnwaite Colony, an experiment at employing the unemployed. (See LABOR COLONIES.) He is author of *Poverty and the State*, and other books and essays.

MINES.—(See COAL ; IRON ; GOLD ; SILVER. For other countries than the United States, see those countries. For wages of miners, see WAGES.) The census of 1890 gives the following statistics of the total mineral products of the United States for 1889 :

RECAPITULATION.
 In protected industries, mainly..... 1,125
 In cattle raising and lands, mainly..... 47
 In making special patented and proprietary articles..... 93
 Inherited, original business in which the fortune was made unknown..... 34

TOTAL VALUE OF THE MINERAL PRODUCTS OF THE UNITED STATES, BY STATES AND TERRITORIES, 1889.

Total	\$587,230,662	Nebraska	\$257,019
Alabama	\$9,828,369	Nevada	10,143,874
Alaska	926,568	New Hampshire	920,164
Arizona	7,248,717	New Jersey	8,275,936
Arkansas	567,683	New Mexico	4,611,764
California	19,699,354	New York	24,105,206
Colorado	41,126,610	North Carolina	451,625
Connecticut	3,099,161	North Dakota	61,431
Delaware	506,754	Ohio	26,653,439
District of Columbia	40,000	Oregon	1,238,114
Florida	138,728	Pennsylvania	150,876,649
Georgia	2,988,935	Rhode Island	987,055
Idaho	8,385,233	South Carolina	3,022,285
Illinois	17,110,317	South Dakota	3,685,862
Indiana	9,704,949	Tennessee	6,455,283
Indian Territory	1,333,897	Texas	1,985,679
Iowa	10,267,668	Utah	11,681,019
Kansas	5,935,981	Vermont	5,674,022
Kentucky	4,171,944	Virginia	6,023,076
Louisiana	480,000	Washington	2,998,355
Maine	8,126,493	West Virginia	6,969,804
Maryland	5,086,447	Wisconsin	10,183,861
Massachusetts	3,700,634	Wyoming	1,810,515
Michigan	79,880,548	Mexican lead smelted in the United States..	2,343,474
Minnesota	11,542,138	Undistributed copper	389,273
Mississippi	41,174	Nickel in imported Canadian matte	21,000
Missouri	15,931,575	Copper from imported pyrites	603,940
Montana	33,737,775	Fuel displaced by natural gas used at pipe lines for drilling and pumping wells and for other uses	1,600,000

VALUE OF PRODUCTION, SUM OF OPERATING EXPENSES, AND AMOUNT OF CAPITAL INVESTED IN THE PRINCIPAL MINERAL INDUSTRIES, 1889.

PRODUCTS.	Value of Production.	Operating Expenses.	Capital Invested.
METALLIC:			
Iron ore	\$33,351,978	\$24,781,658	\$109,766,199
Gold and silver	99,283,732	63,451,136	486,323,338
Copper	26,907,809	12,662,180	62,623,228
Quicksilver	1,199,500	681,401	*1,333,114

* Estimated. † Matte at the mines.
 ‡ Amount received by producers. Value of coal and wood displaced by use, \$21,007,009.
 § Including value of stone used for lime, \$8,217,015; for iron flux, \$1,569,312; for grindstones, \$439,587.
 ¶ Including scraps, \$2450. ¶ Value of the crude product.

MINIMUM WAGE.—In 1874 Mr. Lloyd Jones, a London journalist in active touch with trade-unionists and cooperators, wrote, in *The Beehive*, a labor paper, for July 18, arguing against the principle of the sliding scale, then accepted by many working men, and especially the Northumberland miners (as it is still to-day

by some). The principle accepted the doctrine that wages should vary with prices. Mr. Jones declared this dangerous, and that the trade-unions should at least fix a *minimum wage*, below which their wages should not go. It should be, Mr. Jones wrote, "such one as will secure sufficiency of food and some degree of

personal home comfort to the worker, not a miserable allowance to starve on, but a living wage." Professor Beesley wrote soon after, in the same paper, supporting Mr. Jones's idea, and saying, "All workmen should keep their eyes fixed on this ultimate ideal." The idea may not have been original with Mr. Jones, but he popularized it to some extent, and to-day the minimum, or living wage, is now much discussed in England.

MINORITY REPRESENTATION. See PROPORTIONAL REPRESENTATION.

MIR, THE (from Russian *miru*, concord, *peace*), is the name of the Russian communities of peasants. From the most ancient times the rural population of Russia has been organized into these *mir*s. The land of the *mir* is held in common, the part of it devoted to cultivation being allotted by general vote to the several families on varying terms. Redivisions and equalizations of lots are made periodically; the portion used for dwelling portions is usually theoretically held in common, but practically divided for long periods; the land for grazing is usually undivided. Each *mir* governs itself in all local matters through its elected officers. Widows or women temporarily deprived of their husbands may vote. The land is divided with attempt at equality in proportion to the needs and abilities of each family. Adjacent *mir*s are united into *volasts* or small cantons. The system, however, is changing. (See RUSSIA.) The freeing of the serfs and division of the soil gave each too little land to enable him to live, and the lords are gradually buying or getting it back. The great difference between the *mir* and the *mark* (*q.v.*) is that the members of the *mir* had no voice in the general government. (See MARK; MANOR; PRIMITIVE PROPERTY.)

MISSISSIPPI SCHEME, a scheme started in Paris in 1717 by John Law. Its object was to relieve the French finances. Law established a private bank, and managed it so successfully that in 1718 it became a royal bank. Then the West India Company was formed. To this company the province of Louisiana was granted. It was intrusted with the collection of all taxes and of the royal revenue. It issued paper money freely, but accepted the paper at a premium over specie in payment for shares in the company. A frenzy of speculation seized the nation, from prince to peasant; 2,700,000,000 livres of paper were issued. In 1719 the company shares sold for thirty times their original value. Shrewd speculators, however, began to draw gold from the banks. Legislation tried to limit the amount of gold any one might draw. In 1720 a royal bank was incorporated with the company, and May 21 an edict was issued reducing the value of the bank-notes and company shares one half. This burst the bubble, and universal bankruptcy and distress ensued.

MISSOURI COMPROMISE.—The name given to a law that became a landmark in the Abolitionist struggle. In the session of Congress 1818-19 a bill was introduced to admit Missouri as a State, but prohibit slavery therein.

There was a long and brilliant debate, but finally a compromise was agreed upon, chiefly through the influence of Henry Clay. Missouri was admitted as a slave State February 23, 1821, but at the same time an ordinance was enacted by which slavery should be forever excluded from all territory west of Missouri and north of the parallel 36° 30' (the southern boundary of Missouri). This agreement held till 1854, when the bills establishing the territories of Kansas and Nebraska virtually repealed the compromise, determined the formation of the Republican Party (*q.v.*), and led to the Civil War.

MODEL TENEMENTS. See TENEMENTS.

MOLINARI, GUSTAVE DE, was born March 3, 1819, at Liege. He studied medicine in Brussels, and wrote several works on medicine. Afterward he settled in Paris, where he turned his attention to political science and economy. Returning to Brussels in 1852, he became Professor of Political Economy at the Musée Royal de l'Industrie Belge. Since 1881 he has again lived in Paris as editor-in-chief of the *Journal des Economistes*. With his brother Eugen he founded two periodicals, the *Economiste belge* and *La bourse du travail*.

MONARCHY (from Greek *μοναρχία*, the rule of one) is the form of government in which the supreme power is actually or nominally lodged in the hands of one person, a king or queen. England is a monarchy, because altho the Queen of England is believed by many to have less power in government than the President of the United States, and tho the governing power is in the hands of her ministers, who are subject to Parliament, all government and legislation is in the name of the queen or the ruling monarch. Monarchies are classed as *limited* or *constitutional* and *absolute* or *despotic*, according as the sovereign is or is not limited in his power and functions by the laws or constitutions of the realm. More or less limited monarchies have nearly always existed. From the fifteenth to the close of the eighteenth century monarchies became almost absolute. To-day, except in Asia, absolute monarchy has all but disappeared. Monarchies are usually *successive*—*i.e.*, their monarchs succeed by inheritance. There have been, however, *elective* monarchies, where the monarchs were elected, as formerly in Poland. The German Roman Empire was nominally elective, but for many centuries at the last the heir of the monarch was invariably elected. (For the principles involved in monarchies, see STATE.)

MONASTICISM is a state of religious retirement, more or less complete, and supposed to be accompanied by contemplation and various devotional, philanthropic, or ascetical practices. Monasticism doubtless began in the East, and has entered more or less into almost all religious systems. The aim of the Buddhist monks was to mortify all human passions, to separate and isolate the sexes, to live by mendicancy, and relinquish all personal and individual rights. They overthrew many hoary Hindu superstitions, and raised the common life of the people.

For an account of Jewish monasticism, see ESENESES. The founder of Christian monasticism is generally believed to be St. Anthony. The anchorites of his class separated themselves almost wholly from society, receiving the visits of admirers and of the sick and needy. Occasionally they appeared as stern prophetic spirits from another world in the midst of any unusual pomp or ceremony in the towns. This solitary hermit life gradually gave way to cloister life, or monasticism proper.

Beginnings. At first the personal seclusion of individuals was combined with the existence of a common life; but the isolation became less and less. Not only did the members take upon them the vows of chastity and poverty, but elected a superior and vowed obedience to him. By degrees the monastery became the school for practical, philanthropic, and social Christian life. The monks divided their time between manual labor and their devotions, giving to the poor the surplus product of their work. Cloisters for females began to be established. In the eighth century a kind of middle order between monks and clergy was formed. Most of these had a common house and table; and some branches renounced all their possessions and claimed no private property. Some orders kept schools, and some nursed the sick. In the first part of the thirteenth century the two *mendicant* orders arose—the Franciscans and Dominicans. These orders broadened monasticism still farther, and formed the working classes into half monastic societies, which did not necessitate celibacy or isolation. It was by these two orders that monachism was raised to the height of its power, influence, and prosperity. They wandered over all Europe, instructing the people and attracting general admiration for their sanctity and self-denial. Their advice was eagerly sought in secular and political affairs. They became elevated to college professorships. At last their great influence drew upon them the hostility of the clergy, and their vast riches and prosperity brought about the envy of the nobility, and the ultimate degeneracy and downfall of the monks themselves. Again and again reforms were inaugurated only to be overwhelmed by the growing tide of self-indulgence. Laxity was followed by lust, ownership by avarice, liberality by ungodliness, and honest industry by every manner of corruption. This continued until the general confiscation of their lands and abolition of their privileges, when in a few years no less than 3000 monasteries were broken up in Europe.

But before wealth and influence brought corruption and enervation, the monasteries were centers of learning, of sanctity, and of benevolence. As has been well said, "they were for ten centuries the schools, the archives, the libraries, the hostleries, the studios, the penitentiaries, and the hospitals of Christian society." While it is not difficult in the nineteenth century to arraign monasticism for its fanaticism, its indifference to family life, its unhealthy asceticism, and its turning of the channels of religion into the desert, we must, in all justice, remember what it meant to have, in the rough and violent period of feudalism, monasteries, where

bruised and world-weary spirits found consolation; where the sick found medicine, the hungry found bread, and the benighted and storm-stayed traveler found welcome and rest. Feeble and timorous souls fled to the monasteries from a bloody and force-governed world. With their communal habits of life, their humble industry, and their penitent devotions, the monks formed little scattered islands of peace in the midst of an ocean of war. It was by them that manuscripts were copied and preserved and the chronicles of their times recorded. Monasteries were not mere asylums for broken hearts and disappointed ambitions; the young, the noble, and the brave were found also within their walls, drawn by their severe sanctity, their spirit of universal philanthropy, and their contempt for earthly show.

Altho the Reformation rejected monachism, several types of it have been and are still found in Protestantism. In Germany, both Lutherans and Evangelicals have formed houses of *deacons* and *deaconesses* for the purpose of teaching, healing the sick, visiting prisoners, etc. In the Church of England and the Protestant Episcopal Church of this country, various brotherhoods and sisterhoods have been formed at various times, and have recently been somewhat multiplied, imitating to some extent medieval monastic associations with some modern features. In connection with the American Roman Catholic Church, there are over 300 nunneries and 128 monasteries. C.

MONETARY CONFERENCES.—The importance of the monetary question in recent times and the struggle for bimetallism has led to the holding of several international monetary conferences, in the calling of which the United States has played a leading part. Without considering some earlier less formal conferences, the first international conference met, at the call of the United States, in Paris, August 14, 1878, the Congress of the United States having made provision for calling such a conference if possible. All the prominent European Powers sent delegates except Germany. The only result was a calling attention to the evils seeming to spring from the demonetization of silver. Great Britain, Sweden, Belgium, and Switzerland declared that they would not give up gold monometallism, tho the British delegates strongly favored the full use of silver by other nations.

In 1881 France and the United States called a conference which met at Paris, April 19 of that year. Eighteen countries were represented, including Germany. England and Germany led the gold monometallist party, tho both were willing to make some concessions. The United States, Holland, and Italy led the bimetallists. The convention adjourned till the next year, to give the governments opportunity for reflection and negotiation; but it never reconvened. There were private conferences, especially in 1889, during the Exposition. In 1887 England appointed a royal commission to investigate the relations of gold and silver. It reported in 1888, six of the commission favoring gold monometallism and six favoring international bimetallism. The report of the gold

monometallists was remarkable for its admissions, and one of their number, L. H. Courtney, has since become a bimetalist.

In 1892, there seeming to be a general scarcity of gold, the United States called a third conference. All the European Powers responded, and also Mexico. The United States presented the thesis that "it is desirable that some measures should be found for increasing the use of silver in the currency systems of the nations." Germany, Austria and Russia declared that they had no power to vote. Great Britain, Spain, Denmark, Mexico, and Holland supported the proposition. Other countries were equivocal.

Mr. Alfred de Rothschild of the British delegation proposed that the different European powers should combine to make certain purchases, say to the extent of about £5,000,000 annually, such purchases to be continued over a period of five years, at a price not exceeding 43 $\frac{1}{2}$ per ounce standard; but if silver should rise above that price, purchases for the time being to be immediately suspended.

Mr. Rothschild accompanied this motion with a paper in which, while insisting upon gold monometallism as the sole possible policy for England, he recognized "great grievances both in India and China in connection with the silver question," such that "if anything could be done toward diminishing those grievances, it would be extremely desirable." He raised the question whether it were "not possible to extend the use of silver generally and thereby stop a further fall, the disastrous consequences of which no one can foresee." He could "see no objection to silver being made a legal tender in Great Britain up to £5, instead of £2, as it is at present." In conclusion Mr. Rothschild declared:

"If this conference were to break up without arriving at any definite result, there would be a depreciation in the value of silver which it would be frightful to contemplate, and out of which a monetary panic would ensue the far-spreading effects of which it would be impossible to foretell."

Mr. Rothschild's proposition was much discussed, but objected to as compelling the United States to buy more silver than all Europe together. Many other plans were proposed, but nothing was agreed. Great Britain plainly, and Germany, Austria, and France among the greater Powers, virtually declared that they would not adopt bimetalism, tho favoring some compromise if possible. The conference finally adjourned to reconvene the next year, if the governments approved, but it never reconvened.

MONEY.—(See CURRENCY for a historical sketch of United States currency, and BANKS AND BANKING; BIMETALLISM; CONTRACTION AND EXPANSION OF CURRENCY; CRISES; DEBTS; FINANCE; GREENBACK PARTY; GOLD AND SILVER; MONOMETALLISM; PAPER MONEY, and SILVER, for especial topics.) In this article we treat of money in general, describing the economic nature and function of money, with a sketch of the history of money.

To define the word *money* is both easy and difficult. It is not difficult to define it in almost any one of two or three meanings; but the trouble is that the word is used, and even by writers of repute, in

Definition. more senses than one, and these various senses are so various that no definition can be well made to cover them all. It will be necessary, therefore, to give at least three distinct definitions.

1. *Money* is sometimes used, altho with the least authority, to mean gold and silver or other metal currency, in contradistinction from paper

currency. This use is uncommon, and almost never found in economic writings, but is sometimes met with in popular speech.

2. By *money* is sometimes meant whatever the law declares to be "legal tender" in exchange or in payment of debt. "Legal tender" is that which the law compels a person to receive in payment of debt. This is money in its narrowest sense. It has the "fiat" of government upon it—*i. e.*, government declares or "makes it" to be money. Any man can offer such money to his creditor and compel him to take it at its face value; if the creditor refuse, the debtor is no longer legally liable for the debt. This is the legal sense, and a frequent sense of the word in political economy; but usually, for the sake of clearness, the phrase "legal tender" is used for such money.

3. *Money* is ordinarily used in political economy to mean any article ordinarily in use as a medium of exchange. It has been said that in this sense, "*Money is that money does*" (Walker). To give a more exact definition, we may use Mr. Walker's, which has been widely adopted:

"Money is that which passes freely from hand to hand throughout the community in final discharge of debts and full payment for commodities, being accepted equally without reference to the character or credit of the person who offers it, and without the intention of the person who receives it to consume it or enjoy it, or apply it to any other use than, in turn, to tender it to others in discharge of debts or full payment for commodities" (*Money, Trade and Industry*, p. 4).

FUNCTIONS OF MONEY.

The first function of money is to be a *medium of exchange*. When our earliest ancestors desired to exchange any goods, they did it by direct *barter* or exchange of goods.

The operation is also called *truck* (French, *troc*, barter). Among uncivilized races trade is still carried on in this way; a traveler going into the interior of South Africa takes a stock of beads, knives, pieces of iron, looking-glasses, etc., in order that he may always have something which the natives will like to receive in exchange for food or services. People still occasionally barter things in England or the United States, but this is seldom done, owing to the trouble which it gives.

These difficulties have early caused all races at all civilized to adopt some one article as a common medium of exchange or *money*. Thus, money being exchangeable by custom or by law, if it be legal tender, a man who has any article to sell sells it *for money* to anybody who will buy it, not having to seek an article in exchange, because, having got the money, he can go and buy whatever article he himself wants from any person who has the article he desires. Thus money fulfills its first function of being a *medium of exchange*.

A second function hardly inferior in importance to the one just mentioned is that of affording a ready means of estimating the comparative value of different commodities. Indeed, it may be reasonably maintained that the idea of

general value could not be formed without the existence of money. The adoption of some one commodity renders the comparison of values easy. "The chosen commodity becomes a *common denominator* or *common measure of value* in terms of which we estimate the values of all other goods" (Jevons).

A *third* function of money soon develops itself. Commerce cannot advance far before people begin to borrow and lend, and debts of various origin are contracted. One of the most distinctive features of advancing civilization is the increasing tendency of people to trust each other. Now a contract implies something to be done in the future, and for estimating the value of that future act a standard is required; and money, which already acts as a *medium of exchange* and as a *measure of value* at a given time, performs a third function by affording an approximate means of estimating the value of the future act, and in this respect may be regarded as a *standard of value*, or, as it is sometimes said, of *deferred payments*.

As we shall see later, this is one of the most important uses of money; but now we pass on. Money sometimes also serves a *fourth* purpose—that of embodying value in a convenient form for conveyance to distant places. Something which is very valuable, altho of little bulk and weight, and which will be recognized as very valuable in every part of the world, is necessary for this purpose. The current money of a country is perhaps more likely to fulfill these conditions than anything else, altho diamonds and other precious stones and articles of exceptional beauty and rarity might be employed.

Such are the main economic functions that *money* is designed to fulfill.

We pass on to consider what are the qualities that should characterize the commodity we adopt as money. The *first* quality needed is general acceptability. Money cannot discharge its prime function

Qualities of Good Money. unless everybody, or almost everybody, is willing to accept it. This general acceptability can, however, be secured to a great extent by means of a law, making any kind of commodity legal tender—*i.e.*, requiring all who are subject to the law to accept it as a full and final discharge of obligations. If, however, the Government chooses an unsuitable commodity, the law will be evaded and barter will be resorted to.

The second quality which it is desirable that money should possess is durability, and that *without deterioration*. Cattle and wheat are used as money by some savage tribes, but both of these lack this quality. Gold and jewels possess it in a high degree.

The third of the desirable qualities is portability. Cattle are good in this respect, as they carry themselves. Wheat is bad, as its value compared to its bulk is low. Gold is good; but from this point of view diamonds would be still better.

The fourth and fifth of the desirable qualities are *divisibility* and *uniformity*. Under the latter we may include that the quality is easily defined. Hitherto jewels have seemed even more suitable than gold, but they do not fulfill these requirements. Their value is not easily tested

or attested; and to divide them is difficult and destructive of their value. Metals, on the other hand, are easily coined in any degree of purity. The stamp, edges, etc., serve to prevent willful mutilation, and as gold and silver possess also the qualities of durability and portability in a high degree, they have, very largely, been adopted as money.

There is, however, a *sixth* quality very desirable in money, which gold and silver do not possess to anything like the extent that could be wished. This quality may be described as *steadiness of value*. We have seen that money is generally used as a standard of deferred payments. Now, if the delays in payment were always brief, gold and silver would admirably fulfill this purpose. A hundredweight of gold will exchange to-day for about the same quantity of most other commodities as it would have done six months ago. But if the interval is a long one the fluctuations in the exchange value of gold are very serious.

How this evil can be best remedied is to-day the most-discussed monetary question. (See CONTRACTION AND EXPANSION OF CURRENCY; BIMETALLISM; MONOMETALLISM.) We pass on to notice one more desirable quality in money which is what Jevons calls *cognizability*. He says:

"By this name we may denote the capability of a substance for being easily recognized and distinguished from all other substances. As a medium of exchange, money has to be continually handed about, and it will occasion great trouble if every person receiving currency has to scrutinize, weigh, and test it. If it requires any skill to discriminate good money from bad, poor ignorant people are sure to be imposed upon. Hence the medium of exchange should have certain distinct marks which nobody can mistake. Precious stones, even if in other respects good as money, could not be so used, because only a skilled lapidary can surely distinguish between true and imitation gems.

"Under cognizability we may properly include what has been aptly called *impressibility*, namely, the capability of a substance to receive such an impression, seal, or design as shall establish its character as current money of certain value."

We may now consider some of the general principles which govern the use of money, confining our attention to those which apply to all money. (For a discussion of fiat, paper, or representative money, see PAPER MONEY.)

The first principle is that the supreme quality in money is that it should express a standard of value which will not vary. But value (*g.v.*) merely expresses the exchange ratio between commodities, and this is always more or less changing. It is impossible, therefore, to get a standard which will never change, and the best that can be done is to approximate this. Which money does this best is disputed; some think it is gold; others gold and silver used together; others paper money issued in certain quantities. (For these various views, see MONOMETALLISM; BIMETALLISM; MULTIPLE STANDARD; PAPER MONEY.)

Secondly, we must recognize the force of habit in using particular forms of money and having confidence on it. Jevons says on this point:

"No one can possibly understand many social phenomena unless he constantly bears in mind the force of habit and social convention.

This is strikingly true in our subject of money. Over and over again in the course of history powerful rulers have endeavored to put new coins into circulation or to withdraw old ones; but the instincts of self-interest or habit in the people have been too strong for laws and penalties. Tho in particular instances it may be difficult to explain occurrences which happen in the circulation of coins, yet a close analysis of the character of those who handle money, and their motives for holding it or paying it away, will throw much light upon the subject."

The third principle that we most notice and one of the most important is the so-called Gresham's Law (from Sir Thomas Gresham, who lived in England in the Elizabethan period). This law asserts that when two or more kinds of legal money contend for use in the market, the worst kind of money that is legal will drive the better kinds out of circulation. The reason is simple. When a person pays out any money he inclines to get rid of the worst money he has with which he can legally settle the account. He keeps the best money himself. Consequently the worst money circulates the most and the best is hoarded or driven out of circulation. Hence the necessity of keeping all the money in circulation at par, unless a nation is willing to go to the exclusive use of the worst money.

A fourth principle, and perhaps in modern times the most important of all, is that the quantity of money should be commensurate with the demand for a medium of exchange, because if the amount of money in a country is not increased in proportion to the demand for it, it will rise in value, and thus become a variable standard. Hence the money that is most invariable in value will be that which varies in quantity most exactly in conformity with the demand for it. Hence a currency inelastic in *quantity* may be the most dishonest money, and a currency elastic in *quantity* may be made the most honest.

An elastic currency, however, may also be made dishonest. It depends wholly on how it is varied in quantity. So far as quantity is concerned it should vary exactly with the demand for it, thus, so far as quantity is concerned, being perfectly stable in value. An elastic currency, therefore, at least permits of stability of value; an inelastic currency cannot be honest unless there is no change either in the population of a country or in the use that population has for money. It is not enough merely for a circulation to expand with population, but must expand or contract with the use the population has for money. If a civilization grows more intricate and involved, there are ordinarily more cash transactions, and therefore there is more demand for money. The grave and important questions that arise out of variations in the amount of money are well known. A currency increasing in volume out of proportion to the demand robs creditors; a diminishing currency robs debtors. We here are simply concerned with the principles. (For the important complications and results that grow out of this principle, see CONTRACTION AND EXPANSION OF CURRENCY; BIMETALLISM; MONOMETALLISM; PAPER MONEY; SILVER.) We pass now to the

HISTORY OF MONEY.

The first money used seems to have been fur and skins, because the first societies which made exchanges lived by hunting. Some tribes still use fur and skins. The next stage of society was pastoral, and the corresponding money was cattle or some domesticated animal. The word *pecunia* (Latin for money), whence our word *pecuniary* is probably derived from *pecus*, cattle. In uncivilized portions of the world cattle are still used to express value. A wife, a slave, etc., are still said to be worth so many head of cattle. More advanced communities used articles of ornament, such as shells, like the wampumpeag of the North American Indians, or the ring money of many countries. Agricultural or other natural products were used. Tobacco was commonly used for money in the North American colonies; codfish were used in Newfoundland; cubes of pressed tea in Tartary; sugar in the West Indies. The next stage was the use of various manufactured articles, such as a preparation of leather by the Carthaginians, silk by the Chinese, nails in Scotland, bullets and wampum in Massachusetts.

Metals, however, have been mainly used except in the earliest times. Of metals almost every kind has been used—iron, lead, tin, platinum, nickel, copper, and, above all, silver and gold. Iron has been used until very recently in Japan for small values. In the Homeric age it is said to have been more valued than copper. It rusts, is easily counterfeited, is very heavy, and to-day too cheap to have much intrinsic value, while it is not suited for representative money. (See PAPER MONEY.) Tin was probably early used; the first known instance being by Dionysius of Syracuse. It is thought to have formed the first English coinage. It has been used in Mexico and in Java. Roman emperors and English kings struck tin coins. It is, however, too soft and breakable for much use, and to-day too cheap for intrinsic money. Tin farthings were, however, issued in England as late as 1690. Lead is still more soft, but has been largely employed. Its use is frequently mentioned in the classic poets. It was used in the form of bullets in Massachusetts. It is still employed, or was very recently, in Burmah. Platinum has been used in Russia. It is one of the rarer metals, but very difficult and costly to melt. Nickel is used solely as convenient in making alloys. Copper was one of the first known metals, and is still in use for minor coins everywhere. The earliest Hebrew coins are thought to have been copper, and the metallic currency of Rome down to 269 B. C. was an impure copper or *æs*. It formed the main money of Russia and Sweden in the last century. It is, however, too cheap to have much intrinsic value.

Silver has been the main metal for coinage in historical times. Abraham (Gen. 23 : 16) is said to have paid out shekels of silver, tho this was a weight of silver, not coin. Herodotus attributes the first use of coined gold and silver to the Lydians, tho he also says that the first Greek coinage was made by Pheidon of Argos at Ægina (895 B. C.). Metal first passed every-

where by weight, a system said to have been of Assyrio-Babylonian origin. The talent was originally a weight of silver or gold.

Only later did governments stamp **Early Coins**, on coins an indication of their weight, fineness, and resultant value—the *hall mark* as Jevons calls it. The shape was at first varied—square, hexagonal, octagonal, or round; only later did the round form, and still later the milled edge prevail to prevent clipping and unconscious loss. The standard coin of Athens was the silver drachma, worth six oboli, or about 20 cents. The old Greek talent of silver weighed about 82 lbs. avoirdupois. The Attic talent weighed 57 lbs. of silver. The earliest Roman money was the copper *as*. Silver was introduced 269 B.C.—the silver *denarius*, and was at first about $\frac{7}{8}$ of a Roman pound, but was later debased. A gold coinage seems to have been introduced in Rome, tho little used, as early as 218 B.C. Gold was to silver in proportion just about as silver was to copper, or about 1 to 10.

After the fall of the Roman Empire various silver coins were used. Charlemagne undertook to introduce a general system of money based on the silver pound, known in England as the Troy pound of 12 oz., but the breaking up of his empire prevented this general use. It passed, however, into England, and the pound was divided into 240 pence (*denarii*), 12 of which constituted a shilling (*solidus*). Twenty shillings thus represented a silver pound. Hence the name "pound." The first English gold coin seems to have been that of Henry III. in 1257, when a number of gold pennies were coined at a value to silver of 10 to 1. The first regular series of gold coinage in England, however, dates from 1344, under Edward III. In France, after the breaking of the empire of Charlemagne, 150 povers are said to have issued money. Debase-

Debasements. ment of money became the rule in France. The first debasement of coinage established in history is when Solon (599 B.C.) debased the quantity of silver in the Athenian coins over 25 per cent. Professor Bastable, in an article in the *Encyclopædia Britannica*, thinks it to have been successful, and probably necessary. It was probably not the only Greek debasement, and in Roman history debasement of the coinage was frequent.

The first debasement in English history was in 1300, when Edward I. slightly debased the silver coinage. The practice, however, became common, especially from 1543-52, under Henry VIII. and Edward VI. It wholly ceased, however, after the sixteenth century. Scotch coins were much more debased than English. In France, debasements did not stop with the sixteenth century. Professor Bastable says in the *Encyclopædia Britannica*:

"The final result was that in 1789 the livre had come to only $\frac{1}{5}$ of its weight in the time of Charlemagne. At the Revolution it was converted into the franc, at the rate of 81 livres to 80 frs. It is not, however, to be supposed that the changes in the French currency were always toward debasement. The terrible evils arising from the debased coinage led to a general outcry, which in some cases was so strong as to force the king of the time to reform the monetary standard; one striking instance occurred in the reign of Philip IV.,

whose dealings with the currency led to his receiving the epithet of 'le faux monnoyeur.'"

These depreciations point to the very variable value of metallic money. Allison, in his *History of Europe*, says:

"The two greatest events in the history of mankind have been brought about by a successive contraction and expansion in the circulating medium of society. The fall of the Roman Empire, so long ascribed in ignorance to slavery, to heathenism, and moral corruption, was in reality brought about by a decline in the silver and gold mines of Spain and Greece. . . . The annual supply of the precious metals—of money—for the use of the globe was tripled; before a century had elapsed the price of every species of produce was quadrupled. The weight of debt and taxation insensibly wore off under the influence of that prodigious increase; in the renovation of industry, the relations of society were changed, the weight of feudalism cast off, the rights of man established."

This is, however, undoubtedly an extreme and a partial view. The corruption of the Roman Empire and the incursion of hordes of uncorrupted Germanic tribes cannot be lightly shuffled off as causes of the fall of Rome, nor can the new life of the sixteenth century be so largely attributed to the influx of gold and silver from the mines and treasures of Mexico and Peru. A hundred causes, political, intellectual, religious, and social, led to the new activity of the modern age. Feudalism in England at least was shuffled off before the gold and silver came. The rights of man were not even much preached till long after the discovery of America. Yet undoubtedly the scarcity of money in the Middle Ages and the influx of gold and silver from the New World were potent factors in the history of mankind.

Through the Middle Ages the supply of gold and silver was limited. The report of the recent United States Monetary Commission says:

"At the Christian era the metallic money of the Roman Empire amounted to \$1,800,000,000. By the end of the fifteenth century it had shrunk to less than \$200,000,000."

William Jacob, F.R.S., gives the following table of the amount of metallic money:

A. D. 14.....	\$1,790,000,000
A. D. 230....	909,000,000
A. D. 410.....	537,000,000
A. D. 662.....	256,000,000
A. D. 806.....	168,000,000

All such tables are more or less conjectural, however; the only fact that is generally accepted being that during the Dark Ages mines were little worked. About 800 A. D. the Moors in Spain began to rework her mines, and are supposed from that date to have counteracted the loss by wear and exportation, and accordingly we may regard the metallic supply as fixed in amount until the next change in the conditions of production, which was the result of the discovery of America. The conquest of Mexico (1519) gave opportunities of working the silver mines of that country, while the first mines of Chili and Peru were almost simultaneously discovered, and in 1545 those of Potosi were laid open. From this latter date we may regard the American supply as an influential factor in the matter, and look upon the stock of money as increasing. The annual addition to the store of money has been estimated as £2,100,000 for the period from 1545-1600. At this date the Brazilian supply began.

At the commencement of this century the annual production of gold has been estimated as being from £2,500,000 to £3,000,000. The year 1809 seems to mark an epoch in the production of these metals, since the outbreak of the revolts of the various Spanish dependencies in South America tended to check the usual supply from those countries, and a marked increase in the value of money was the consequence. During the period 1809-49 the value of gold and silver rose to about two and a half times their former level, notwithstanding fresh discoveries in Asiatic Russia. The annual yield in 1849 was estimated at £8,000,000. The next important date for our present purpose is the year 1848, when the Californian mines were opened, while in 1851 the Australian discoveries took place. By these events an enormous mass of gold was added to the world's supply. The most careful estimates fix the addition during the years 1851-71 at £500,000,000, or an amount nearly equal to the former stock in existence.

It is from these variations in the quantity, and therefore in the value of money, that the modern history of money takes its rise. The various coins of uncertain value in the Middle Ages, many of them depreciated by governments, by private money-clippers, or by use, gave occasion to the custom in Venice, Genoa, and perhaps elsewhere, of placing them in so-called banks, having them carefully valued by experts, and the depositors receiving various receipts for the same, which receipts circulated as money, often with a premium above coin, and often enduring even long after the coin deposited in the banks had been seized by ruthless kings or dishonest speculators. In this custom probably lies the beginning of paper money, which henceforth plays so large a part in the history of money, and for an account of which see articles PAPER MONEY; BANKS AND BANKING; BANK OF VENICE, etc.

Again, in the experience of England with depreciations of currency and in the fall of money values occasioned by the influx of gold and silver when the New World was discovered, is the occasion for the comparatively early commitment of England to the doctrine of gold monometallism (*q.v.*), which has led to the greatest monetary changes and monetary conflicts of modern times. Up to the year 1819 almost all nations, as we have seen, issued coins of both gold and silver, as well as of other metals, and tried to regulate their relative values by royal or governmental proclamations. Altho supply and demand continually tended to change the relative value of the two metals, and altho from about 1760-1810 enormous quantities of silver poured into the world from mines in Mexico and elsewhere (so that in 1800 the world's annual silver product was nearly three times its product in 1700), the actual alteration in the relative values aforesaid was but slight. In 1803, therefore, France adopted her famous law making 15½ parts of silver equal to one part of gold in all transactions. England, however, in 1816, under the second Lord Liverpool, took an opposite course, and demonetized silver as a standard.

From this time on the history of money becomes the history of the bimetallic controversy, for which we refer our readers to the article BIMETALLISM; see also PAPER MONEY. For the history of money in the United States, see CURRENCY.

The following table, compiled from the report of the Director of the United States Mint, gives the present approximate amount of money in the world:

COUNTRIES.	Ratio between Gold and Full Legal Tender Silver.	Ratio between Gold and Limited Tender Silver.	Gold Stock.	Silver Stock.	Uncovered Notes.	PER CAPITA.			
						Gold.	Silver.	Pa-per.	Total.
United States	1 to 15.98	1 to 14.95	\$661,000,000	\$624,000,000	\$469,000,000	\$9.81	\$9.25	\$6.96	\$26.02
United Kingdom	1 to 14.28	1 to 14.28	549,000,000	112,000,000	127,000,000	14.17	2.04	3.33	20.44
France	1 to 15½	1 to 14.38	800,000,000	500,000,000	110,000,000	20.89	13.05	2.87	36.81
Germany	1 to 13.957	1 to 13.957	618,000,000	215,000,000	84,000,000	12.51	4.35	1.70	18.56
Belgium	1 to 15½	1 to 14.38	54,000,000	54,900,000	54,000,000	8.85	9.00	8.85	26.70
Italy	1 to 15½	1 to 14.38	96,000,000	16,500,000	179,000,000	3.16	.54	5.89	9.59
Switzerland	1 to 15½	1 to 14.38	15,000,000	15,000,000	12,000,000	5.17	5.17	4.14	14.48
Greece	1 to 15½	1 to 14.38	500,000	3,000,000	23,400,000	.23	1.36	10.63	12.22
Spain	1 to 15½	1 to 14.38	40,000,000	155,000,000	105,000,000	2.28	8.86	6.00	17.14
Portugal	1 to 14.08	1 to 14.08	40,000,000	10,000,000	40,000,000	8.51	2.13	10.42	21.06
Austria-Hungary	1 to 13.60	1 to 13.60	124,000,000	85,000,000	187,000,000	3.00	2.06	4.53	9.59
Netherlands	1 to 15½	1 to 15	19,000,000	56,000,000	37,000,000	4.13	12.17	8.04	24.34
Scandinavian Union	1 to 14.88	1 to 14.88	28,000,000	12,000,000	12,000,000
Russia	1 to 15½	1 to 15	422,000,000	41,000,000	550,100,000	3.40	.33	4.44	8.17
Turkey	1 to 15½	1 to 15½	50,000,000	44,000,000	1.27	1.12	2.39
Australia	1 to 14.28	1 to 14.28	105,000,000	7,000,000	24.42	1.63	26.05
Egypt	1 to 15.68	1 to 15.68	120,000,000	15,000,000	17.65	2.20	19.85
Mexico	1 to 16½	5,000,000	50,000,000	2,000,000	.44	4.38	.18	5.00
Central America	1 to 15½	8,000,000	4,000,000	.15	2.42	1.21	3.78
South America	1 to 15½	45,000,000	30,000,000	600,000,000	1.31	.87	17.49	19.67
Japan	1 to 16.18	50,700,000	81,300,00099	2.01	4.00
India	1 to 15	950,000,000	37,000,000	3.31	.13	3.44
China	725,000,000	1.80	1.80
The Straits	110,000,000	28.04	28.04
Canada	1 to 14.95	1 to 14.95	14,000,000	5,000,000	29,000,000	2.92	1.04	6.04	10.00
Cuba, Hayti, etc.	1 to 15½	21,000,000	4,400,000
Total	\$3,901,900,000	\$3,931,100,000	\$2,700,000,000

The following table gives the values of foreign coins in United States money, proclaimed by the Secretary of the Treasury, October 1, 1895 :

COUNTRY.	Standard.	Monetary Unit.	Value in United States Gold Dollar.	Coins.
Argentine Republic	Gold and Silver.	Peso	\$0.965	Gold: argentine (\$4.82,4) and ½ argentine. Silver: peso and divisions.
Austria-Hungary...	Gold.....	Crown20,3	{ Gold: former system—4 florins (\$1.92,9), 8 florins (\$3.85,8), ducat (\$2.28,7) and 4 ducats (\$9.15,8). Silver: 1 and 2 florins. Gold: present system 20 crowns (\$4.05,2) and 10 crowns (\$2.02,6).
Belgium	Gold and Silver.	Franc.....	.19,3	Gold: 10 and 20 francs. Silver: 5 francs.
Bolivia.....	Silver.....	Boliviano.....	.48,6	Gold: boliviano and divisions.
Brazil.....	Gold.....	Milreis.....	.54,6	Silver: 5, 10, and 20 milreis. Silver: ¼, 1, and 2 milreis.
Canada	Gold.....	Dollar.....	1.00	
Central America...	Silver.....	Peso.....	.48,6	Silver: peso and divisions.
Chile	Gold and Silver.	Peso.....	.91,2	Gold: escudo (\$1.82,4), doubloon (\$4.56,1), and condor (\$9.12,3). Silver: peso and divisions).
China.....	Silver.....	Tael { Shanghai.. Haikwan.. Tientsin... Cheefoo..	.71,8 .80,0 .76,2 .75,2	
Colombia.....	Silver.....	Peso48,6	Gold: condor (\$9.64,7) and double-condor. Silver: peso.
Cuba	Gold and Silver.	Peso92,6	Gold: doubloon (\$5.01,7). Silver: peso.
Denmark.....	Gold.....	Crown26,8	Gold: 10 and 20 crowns.
Ecuador	Silver.....	Sucre.....	.48,6	Gold: condor (\$9.64,7) and double-condor. Silver: sucre and divisions.
Egypt.....	Gold.....	Pound (100 piasters)....	4.94,3	Gold: pound (100 piasters), 5, 10, 20, and 50 piasters. Silver: 1, 2, 5, 10, and 20 piasters.
Finland.....	Gold.....	Mark.....	.19,3	Gold: 20 marks (\$3.85,9), 10 marks (\$1.93).
France.....	Gold and Silver.	Franc.....	.19,3	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
Germany	Gold.....	Mark.....	.23,8	Gold: 5, 10, and 20 marks.
Great Britain.....	Gold.....	Pound sterling.....	4.86,6½	Gold: sovereign (pound sterling) and ½ sovereign.
Greece.....	Gold and Silver.	Drachma.....	.19,3	Gold: 5, 10, 20, 50, and 100 drachmas. Silver: 5 drachmas.
Hayti.....	Gold and Silver.	Gourde.96,5	Silver: gourde.
India.....	Silver.....	Rupee23,1	Gold: mohur (\$7.10,5). Silver: rupee and divisions.
Italy	Gold and Silver.	Lira.....	.19,3	Gold: 5, 10, 20, 50, and 100 lire. Silver: 5 lire.
Japan.....	Gold & Silver*..	Yen.....	.99,7 .52,4	Gold: 1, 2, 5, 10, and 20 yen. Silver: yen.
Liberia.....	Gold	Dollar.....	1.00	
Mexico.....	Silver.....	Dollar.....	.52,8	Gold: dollar (\$0.98,3), 2½, 5, 10, and 20 dollars. Silver: dollar (or peso) and divisions.
Netherlands.....	Gold and Silver.	Florin.....	.40,2	Gold: 10 florins. Silver: ½, 1, and 2½ florins.
Newfoundland.....	Gold.....	Dollar.....	1.01,4	Gold: 2 dollars (\$2.02,7).
Norway.....	Gold.....	Crown26,8	Gold: 10 and 20 crowns.
Peru.....	Silver.....	Sol48,6	Silver: sol and divisions.
Portugal.....	Gold.....	Milreis.....	1.08	Gold: 1, 2, 5, and 10 milreis.
Russia	Silver†.....	Rouble.....	.77,2	Gold: imperial (\$7.71,8) and ½ imperial† (\$3.86).
Spain	Gold and Silver.	Peseta38,9	Silver: ¼, ½, and 1 rouble.
Sweden.....	Gold.....	Crown19,3	Gold: 25 pesetas. Silver: 5 pesetas.
Switzerland.....	Gold and Silver.	Franc.....	.26,8	Gold: 10 and 20 crowns.
Tripoli.....	Silver.....	Mahbub of 20 piasters..	.43,8	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
Turkey.....	Gold.....	Piaster.....	.04,4	Gold: 25, 50, 100, 250, and 500 piasters.
Venezuela...	Gold and Silver.	Bolivar.....	.19,3	Gold: 5, 10, 20, 50, and 100 bolivars. Silver: 5 bolivars.

* Gold the nominal standard; silver practically the standard.

† Coined since January 1, 1886; old half-imperial = \$3.98,6.

‡ Silver the nominal standard; paper the actual currency, the depreciation of which is measured by the gold standard.

References, see before table.

MONOMETALLISM is the theory, or the practice of the theory, that only one metal should be used as a standard of value in the coinage of a country, or, as it is sometimes defined, it is the use of only one metal as full legal tender. Any metal, so far as the definition

goes, could be used as the standard; but for reasons of convenience, confidence, and stability of value (see MONEY), civilized countries confine themselves to the metals gold or silver as the standard, and at present almost exclusively to the use of gold.

This being the case, we devote this article to a statement of and the arguments for gold

monometallism. (For a history of the money question in the United States, see CURRENCY. For general monetary principles, see MONEY; CONTRACTION AND EXPANSION OF CURRENCY; PAPER MONEY. For views opposed to monometallism, see BIMETALLISM; PAPER MONEY; SILVER. For statistics as to gold and as to silver, see GOLD and SILVER.)

GOLD MONOMETALLISM.

This view teaches that, at least in the present stage of civilization, the only money which should be used as primary money, and, therefore, as the standard of value, should be gold. Other metals, like silver, copper, etc., may be advantageously used for subsidiary coinage (small change, etc.); and various forms of credit money (bank-notes, letters of credit, private notes, Clearing House notes, etc.) may be used in the large amount of transactions, as they are used to-day; but gold should be the only standard.

The argument for this view rests mainly on a deduction from long experience, which we shall outline later; but it will serve clearness to notice first the general argument.

This is, in a word, that the main qualities of a standard of value should be invariability and the enjoyment of general confidence, and that gold furnishes these qualities far more than any other metal. It is not asserted that even gold never varies in value, that it may not have and has not at times appreciated, but it is asserted that gold varies less in value than any other standard which can be used. The fall of prices of which bimetalists and silver advocates make so much, gold monometallists say, is not primarily due to the appreciation of gold, but to improvements in production, and has, however occasioned, not worked the harm asserted; because if it has lowered prices it has raised the real wages of all wage-workers and receivers of fixed income; while as for producers not wage-workers, if it has lowered income, it has equally lowered expenses. Even debtors have been able to borrow at lower and lower rates of interest, so that, if their debts have appreciated, they have been able to multiply their production to pay off their

debts. The mortgage indebtedness of the country, of which so much is made, is really not an indication of depression, but of prosperity and of a demand for improvements. (See MORTGAGES.) Whatever modicum of loss has come from an appreciating gold standard is far more than atoned for by relief from the uncertainties of a double standard, or of a currency in which the public has no confidence. The two things most fatal to prosperity are uncertainty and lack of confidence as to the value of money. All else can be endured but these. The absence of these qualities takes the very life out of business, and oppresses particularly the working and poorer classes. When there is uncertainty and lack of confidence, people are afraid to invest, new undertakings are not started, old enterprises shut down or are curtailed, workers are discharged, distribution checked, demand lessened, and general stagnation produced. These are exactly the conditions we have to-day in the United States, and the cause, say the gold monometallists, is the constant fear of silver legislation and the consequent lack of confidence which we have had in the United States more or less for the last 20 years. It is not true that prices depend on the quantity of *legal-tender money*, but on the quantity of *all money*, and on the *quality* of the legal tender. If the quality of the legal-tender money be above suspicion—that is, enjoying absolute confidence—then upon that firm basis the *quantity* of bank notes, subsidiary coinage, and other forms of current money can be built which business demands. England has long had the single gold standard, unburdened by silver or other unsound legislation. Consequently England can get all the money she wants. The United States could have all the money she could use if people had confidence in her standard. A per capita circulation based on legal tender is misleading. The real question is the *quality* of the legal tender and the per capita circulation of *what is used for money resting on a firm basis*. *The People's Money* (vol. ii., No. 7, of *Sound Currency*, p. 24) gives the following table of the currency of the world, and the per capita circulation:

Quality Theory.

COUNTRIES.	Popula- tion.	Stock of Gold.	Stock of Silver.	Uncovered Paper.	PER CAPITA.				
					Gold.	Sil- ver.	Pa- per.	Bank Cred its.	Total.
United States.....	68,900,000	\$626,600,000	\$625,300,000	\$475,700,000	\$9.09	\$9.08	\$6.90	\$80.50	\$105.57

This table is made up from data given in the report of the director of the mint, 1894, and Mulhall's *Dictionary of Statistics*.

It will be seen that England, tho she has a smaller per capita circulation of gold, silver, or paper money than either France or the United States, has a much larger per capita of circulation of what passes for money, because the quality of her standard of value is above suspicion. Quality infallibly leads to quantity; quantity without quality leads to shipwreck.

Such is the general argument for gold monometallism, but it is based on a long deduction from experience which we can here only abridge. Gold monometallism, say its supporters, is the natural mature product of advancing civilization. The gold conspiracy of which so many silver advocates make so much simply does not exist and never has been proven, however strongly asserted, because it never has existed. Each nation has come to the gold standard simply because it found it for its interest to do so. The "crime of '73," of which one hears so much, never took place. Silver had not been coined in the United States to any appreciable

degree for 40 years before 1873. It was in 1873 worth more as bullion than as money, so nobody desired it coined. The act of 1873 simply legally recognized demonetization, which had virtually been a fact for

40 years. Nor was it done surreptitiously or without knowledge. The measure was recommended by the Secretary of the Treasury in three successive messages; the bill was printed 13 times, considered through five sessions of Congress, and the debates concerning it occupy 140 pages of the *Congressional Record*, as any one may see. Most of the present prominent silver men who were in Congress at that time, like Senator Jones, voted for it. "The crime of 1873" exists, therefore, only in the heated imagination of the perhaps well-meaning but mistaken opponents of sound currency. So with Germany's demonetization of silver, commenced in 1871 and completed in 1873. When the new German Empire was established she found herself confronted with several different systems of legal-tender silver coins, besides gold and paper. The paying of the French war indemnity allowed her to go to the single gold standard; it seemed the simplest and best step, and was taken. So with other nations; so with England, which first came to the single gold standard. Hitherto all the world had used both gold and silver or other commodities, but they had worked great evil because of the continual changes and uncertainty of value between silver and gold. In France, there were 26 changes of ratio of silver to gold between 1602 and 1773. England had had a long and bitter experience of currency debasement (see MONEY), and when that was over had found her silver so worn that it was not worth its face value. In 1774 she had been compelled on this account to limit the legal-tender value of silver to £25. But even this was not enough. New good silver was driven out of circulation by the old poor silver; so finally, in 1816, she adopted the single gold standard, and has continued it successfully ever since. Other countries did not come to it for nearly 50 years. France, said by bimetalists to have practised bimetalism successfully from 1803

to 1873, did not really have bimetalism. The market ratio of gold and silver continually varied during that period from 15.40 to 16.25, and the cheaper metal continually drove out the dearer, sometimes gold, sometimes silver. At last even France had to come to gold. All the great nations of the earth thus have been compelled by their own experiences to come to the gold standard.

It is not denied by gold monometallists that theoretically a fiat currency could be sustained under proper limitations (see PAPER MONEY; MULTIPLE STANDARD), and some of them admit that this may be the money to which civilization may ultimately come; but this, they say, is very far in the future, and can be considered only when human nature and public confidence have reached a far greater height than at present. To-day, experience manifestly teaches that the only path of safety is to keep to the gold standard, and meanwhile to expand private paper money just so far as confidence is developed. Says *The People's Money* (p. 17):

"Inconvertible paper money issued by a government may be maintained at a parity of value with metallic money, provided the following conditions, five in number, exist:

"1. There must be a monetary unit, as in the case of convertible paper money.

"2. There must be a considerable volume of metallic money in the country, and sufficient foreign trade, or other specific use for coins to keep them in general circulation.

"3. The government must make no distinction in its dealings with the people between the two kinds of money; both or either must be received and paid out with at least ostensible impartiality.

"4. Provision must be made by taxation or by voluntary funding for the prompt absorption of any redundancy apparent in the volume of outstanding paper money.

"5. The people using the paper money must have confidence in the purpose and the ability of the government to maintain indefinitely the four preceding conditions.

"Both convertible and inconvertible paper money become depreciated the moment public confidence is shaken in the purpose or power of the issuer to preserve the conditions under which alone such money can circulate in interchangeable effectiveness with coins. Under Gresham's law the primary effect of the depreciation is to cause contraction of the total volume of circulating medium, by expelling from it all money that is not depreciated. What is left thus becomes a sort of leprous currency, with which association and mingling is abhorrent to all forms of sound and healthy money."

Of the experience of the world in depreciated currencies it is, however, not necessary to speak here. It will be found under the article MONEY, subhead "Debasements." It should, however, be pointed out that gold monometallists consider the panic of 1873 and most such panics due to over-issue of depreciable paper and other forms of money, redeemable or irredeemable, which unnaturally stimulated industry, and unavoidably led at last to a crisis. This will be and always must be, they assert, the result of currency inflation, especially with debased money, now or at any other time. In proof of the assertion that prices have fallen, not because of the demonetization of silver, but because of improvements in the methods of production, transportation, etc., the gold advocates present an almost infinite amount of evidence.

Mr. D. A. Wells, writing in the *New York Tribune* for September 7, 1896, says:

"No one has ever been able to name a single com-

modity that has notably declined in price within the last 30 years, and satisfactorily proved, or even attempted to prove, that such decline was due to the appreciation of gold. And the reason for such default is that it cannot be done. On the other hand, not a single commodity that has notably declined in price within this time can be named, in respect to which clear, abundant, and specific evidence cannot be adduced in proof, that this decline has been due to decreased cost of production or distribution, or to changes in supply and demand occasioned by wholly fortuitous circumstances.

"How great has been the average increase or saving in the world's work of production or distribution cannot perhaps be accurately stated. But few investigators place it at less than 40 per cent., and in some great branches of industry it has certainly amounted to 70 or 80 per cent. Taking a majority of other than hand-made commodities into consideration, the saving of labor within the last 30 years has probably been equal to at least 40 per cent. in producing any given article. We have here, therefore, a natural, sufficient, and non-disputable cause of the remarkable decline in prices under consideration, and also for the continuance of such decline; for prices are still falling, and the only assignable and probable reason why the decline experienced has not been greater is, that decreased cost has occasioned increased demand and consumption, which, to a considerable extent, has antagonized the natural tendency to decline.

"This decline in prices admits of many examples of complete demonstration and illustration in respect to cause—*viz.*, increased production by reason of improved methods or new conditions, which have resulted in decreased cost; a supply in excess of current market demand, and continuous decline in market prices. In other words, the price of any commodity is fixed simply and solely by the proportions of such articles as are produced and consumed, and prices cannot be and are not fixed in any other way.

"Take, first, the market decline in the price of wheat, which typifies more than any other one product the grievance of the American farmer. The cause of this decline is the indisputable fact that more wheat has been and is still produced,

The Real Cause of Fall in Prices. but more than it is willing to buy. The average annual wheat crop of the United States in the four years 1869-72 was 244,187,000 bush. Since 1890 the average crop has been about 570,000,000 bush. In 1873 there was practically no wheat exported from India. In 1892 India exported 56,566,000 bush. In 1883 the Argentine States of South America were not named as a factor to the smallest extent in the world's wheat supply. To-day they are among its greatest sources of supply, and of their surplus product, exported in 1894, 60,000,000 bush. A few years ago there were but few reapers and harvesters for wheat in Russia, and hardly a grain elevator in connection with storage and delivery buildings. To-day Russia is rapidly introducing improved agricultural machinery, with the result that its annual wheat product has increased from 168,545,000 bush., in 1891, to 300,000,000 in 1894. There has also been a very marked increase in recent years in the wheat crops of Austro-Hungary and of Spain. It is impossible, therefore, to resist the conclusion that the production of wheat in the world has been increasing much faster than the necessities of the world's wheat-eaters, and that the increased production has been in the countries where wheat is produced at the least cost. In addition to these conditions, we have now the announcement that the surplus of agricultural products in Australia available for export is in excess of the demands of the people of the United Kingdom for consumption.

"The increase in the average of the annual cotton crop in the United States in the years from 1871-72 to 1880-90 was more than 100 per cent., while the increase in the population of the country during the same period was about 56 per cent. During the same period it is certain that the world's consumption of cotton did not keep up with its production. The legitimate sequel of this has been that midland cotton that sold in 1880 for 11.5 cents per pound sells now (August, 1896) for 7½ cents.

"Similar illustrations of what has happened to the world's products might be multiplied to almost any extent; but space will admit of but few additional citations. In 1883 the metal aluminium sold for \$90 per pound. Its present market value is less than 50 cents. Copper kettles which sold in 1860 for \$2.50 can now be bought for 75 cents, and this homely example illustrates the great decline which has taken place in the price of

copper since 1880—*i. e.*, from 25 cents to 10 and 11 cents in 1896, which has been mainly due to the extraordinary productiveness of American mines and new methods of mining and smelting. Pig iron sold for \$50 per ton in 1873. The same grade can now be bought for \$11. Between 1873 and 1892 the increase in the production of pig iron in the United States was 342 per cent. Recognized authorities state that since 1870 the world's wool clip has increased 155 per cent. Careful analysis has shown that the decrease in price in recent years of the four great raw materials of the world's industries—iron, wheat, cotton, and wool—in consequence of over-supply of each of them in excess of current demand, has materially affected the market price of products (in the way of decline), whose average annual value is not less than 2,000,000,000 of gold dollars.

"Again, the price of money, representing capital, has continually declined since 1871 in all gold-standard countries in almost as great a degree as agricultural or manufactured products, and to the great detriment of a large number of good people who own a small capital invested in securities, besides carrying on some business or profession, and on the combined incomes from which they depend for a living.

"In 1877 an investment of \$10,000 could be relied upon for an annual income of \$600. To-day the same amount of money, invested with equal security, cannot be made to yield more than \$400 per annum. And for this result, which may be fairly regarded in the light of a depreciation of all property, the conceded increase in the amount of the world's capital seeking investment is clearly accountable. In contravention of this conclusion, it is asserted that 'money cannot command as big interest as formerly, as borrowers are too poor in collateral to bid for it.' But the fact is that the rates of interest are lowest in those countries—like England and France—where good collaterals are most abundant.

"Land unquestionably in recent years has also declined in value, due in a certain and correct sense to over-production. The fixed acreage of the United States has not increased; but the tillable acreage has been enormously enlarged. Every railroad that has been built at the West has brought millions of acres in competition with the lands of the older States and of other countries. It is the competitive supply of cereals and animal products of the American farmer that has lowered the price of land and nearly starved the English agriculturist."

Such is Mr. Wells's argument, which he expanded seven years before in his *Recent Economic Changes*. In that book he shows, too, that commodities not cheapened in production have not fallen in price. He says:

"In the first place, all that large class of products or services, which are exclusively or largely the result of handicrafts; which are not capable of rapid multiplication, or of increased economy in production, and which cannot be made the subject of international competition—have exhibited no tendency to decline in price, but rather the reverse. A given amount of gold does not now buy more, but less, of domestic service and of manual and professional labor generally than formerly; does not buy more of amusement; not more of hand-woven lace, of cigars, and of flax, which are mainly the products of hand labor; of cut-glass, of gloves, of pictures, or of precious stones. It buys no more of horses, and other domestic animals; of pepper; of cocoa, the cheap production of which is limited to a few countries, and requires an interval of five years between the inception and maturing of a crop; of malt liquors, eggs, currants, and potatoes; nor also of house rents, which depend largely upon the price of land, and which in turn is influenced by fashion, population, trade, facilities for access, and the like. Retail prices generally have not fallen in proportion to the decline in wholesale prices; and one explanation that has been given for such a result is, that retail trade is more directly and largely dependent on personal services.

"How little of change in price has come to the commodities of countries of low or stagnant civilization, that have remained outside of the current of recent progress, is strikingly illustrated in the case of a not unimportant article of commerce—namely, the root *sarsaparilla*, which, with a gradually increasing demand, continues to be produced (collected and prepared) in Central America, by the most primitive methods, and without any change in the conditions of supply, save, possibly, some greater facilities for

transportation from the localities of production to the ports of exportation."

A second argument for believing that the fall in prices has not been due to the appreciation of gold, Mr. Wells finds in the lessening demand for gold. He argues (p. 207) that the world's annual *product* of gold—consequent mainly upon the exhaustion of mines in California and Australia—has largely diminished in recent years, the opinions as to the extent of this reduction of supply vary somewhat; but that this is not to say that the *amount* of gold in the world has diminished or is in danger of diminishing. He says:

"No one doubts that the amount of gold in the civilized countries of the world has largely increased in recent years. According to Dr. Soetbeer (Soetbeer's *Materialien*, second edition, 1886, p. 47), the monetary stock of gold and gold reserve in the treasuries and principal banks of civilized countries has shown an increase for every decade since 1850, and at the end of 1885 was nearly four times what it was in 1850; so that, instead of there being a reduced supply of gold, as compared with 35 years ago, there is a greatly increased supply.

"Professor Laughlin estimates this increase to have been 'from \$477,000,000 in 1870-80 to \$836,000,000 in 1885.' In 1871-74 there was, according to the same authority, '\$1 in gold for every \$3.60 of the paper circulation of the banks of the civilized world; in 1885 there was \$1 of gold for every \$2.40; the total note circulation increasing during the same time to the extent of \$464,000,000, or 29 per cent.' In 1870-74 the gold reserves amounted to 28 per cent. of the total

Lessening Demand for Gold.

note circulation, and 64 per cent. of all the specie reserves; in 1885 'the gold bore a larger ratio to a larger issue of paper, or 41 per cent. of the total note circulation, and 71 per cent. of the specie reserves. This,' as Professor Laughlin remarks, 'is a very significant showing. What it means, beyond a shadow of doubt, is that the supply of gold is so abundant that the character and safety of the note circulation have been improved in a signal manner. . . .

"Now, while the supply of the precious metals for money purposes has been amply sufficient to meet all requirements, there is abundant evidence in proof that the use of metallic money for the purpose of effecting exchanges has been greatly supplemented in recent years through numerous and varied agencies. 'In America, France, and Germany there are, besides gold coins, immense sums of silver money, paper money, and uncovered bank-notes; and these media of circulation are fully equivalent to gold in value, owing to public or private credit; and, therefore, in the figures of prices they have the same influence in commerce as a corresponding amount of gold money would have.'

"Never before in the history of the world have there been so many and such successful devices invented and adopted for economizing the use of money. Every increase in facilities for banking and for the granting and extension of credits largely contributes to this result; the countries enjoying the maximum of such facilities requiring the smallest comparative amount of coin for their commercial transactions. In the United States the number of national banks increased from 2052 in December, 1879, to 3151 in December, 1888, or in the ratio of over 53 per cent. . . .

"The great reduction in the time and cost of distribution of commodities, and the facility with which purchases can be made and credits transmitted by telegraph, have also resulted, not only in an enormous saving of capital, but also in an ability to transact an increased business with diminished necessity for the absorption and use of actual money. A most striking illustration in proof of this, given by Mr. Fowler (*Appreciation of Gold*, London, 1885), is, that while the total British export and import trade, aggregating £6,000,000,000 from 1866 to 1875, was accompanied by an aggregate export and import of £530,000,000 of bullion and specie, an aggregate value from 1876 to 1885 of £6,700,000,000 was moved with the aid of only £439,000,000 of bullion and specie. The same authority refers to an eminent English firm doing business with the East, as stating that 'their business could now be conducted with one fifth of the capital formerly employed,' which would seem to warrant the inference that the

reduction in the necessity for using so much of their capital as was represented by money had also been proportionate.

"For the settlement of international balances—a large function of gold—it is certain that every ounce of this metal—through the great reduction in the time of ocean transits—is at the present time capable of performing far more service than at any former period; the time for the transmission of coin and bullion having been reduced in recent years between Australia and England from 90 to 40 days, and from New York to Liverpool from 12 or 15 to 8 or 9 days. Such an increase of rapidity in doing work is certainly equivalent to increase in quantity.

"The very great change which has taken place in the United States in this respect is thus noticed in the report of the United States Controller of the Currency for 1888:

"Of late years the gold movement across the Atlantic has become much more sluggish, because something has been found to take its place, and to some extent, at least, to serve the purpose of regulating exchanges and transferring capital. Certain securities on the New York stock-list have come to be largely and constantly dealt in at the European monetary centers, and as, by means of cable communication and through the close competition of dealers, their values are generally at a level in all markets, they supply a cheaper means of settlement than gold, and a more convenient basis for exchange operations.' These securities 'have become the stock in trade of dealers in foreign exchange; they are shipped back and forth according as exchange quotations fluctuate; and, indeed, in many cases they are not even shipped; the ownership is transferred by a cablegram, and this transfer supplies a basis for bills of credit.'

Mr. Wells then goes on to show how clearing-house certificates and postal orders and notes are also taking the place of coin. He says on this point:

"The number of 'postal' orders issued by the British Post Office in 1887 was 35,108,754, representing £14,228,734 (\$69,151,000); while money orders, domestic and foreign, were issued during the same year to the amount of £27,320,000 (\$132,776,000).

"Domestic money orders were first issued in the United States in 1864. In the fiscal year 1864-65 the total amount issued represented \$1,360,122; but for the fiscal year ending June 30, 1888, the amount of such orders issued had grown to \$119,649,064. The growth of the international money-order system has been even more marked. Such orders were first authorized in 1869, and the total amount issued from September 1, 1869, to June 30, 1870, was only \$22,189. From 1872, however, the system made rapid strides, and in the fiscal year 1887-88 the total amount issued had grown to \$11,293,870.

"In estimating the influence of any diminished production of gold in recent years, it is important to bear in mind a point to which attention has been often heretofore called, and that is, that gold and silver are not like other commodities, of which the greater part of the annual production is annually consumed; but that their use for the purpose of effecting exchanges does not involve consumption, except by loss and wear. . . . The aggregate stock of gold has not diminished, but has continually increased, and the annual addition to the world's stock is greater at present (1886) than in any former period. Dr. Soetbeer estimates 'the production of gold since the end of the fifteenth century to have been £1,553,415,000 (\$7,549,596,000). An annual supply of £20,000,000 (\$97,000,000) above the present average product would consequently be about 1¼ per cent. on that stock.'

"The evidence, therefore, seems to fully warrant the following conclusions: That the tendency of the age is to use continually less and less of coin in the transaction of business; and that 'so far from there being any scarcity of gold, there never was a period in the world's commercial history when the existing quantity was so large as at present, in proportion to the necessity for its use or for the purposes it has to serve.'

"As civilization has increased, and as new, quicker, and cheaper methods for the interchange of thought and commodities have been invented and adopted, the function of gold as a medium of exchange—the one that necessitates a large and continually augmenting supply, and entails the greatest wear and loss—is rapidly diminishing in importance by the supplement-

tation of other and better agencies. On the other hand, the function of gold as a measure or verifier of values, by reason of its exemption from value fluctuations to a greater extent than any other product of labor, is becoming of greater and greater importance with the continually increasing volume of the world's production and distribution, and more especially since the other precious metal—silver—has become uncertain and fluctuating in value."

One further quotation we will make from Mr. Wells. Showing the unfairness of some of the arguments of the silver advocates, he says :

"The following statements were made in a memorial signed by 95 members of the United States House of Representatives of the Forty-eighth Congress, and presented to the President of the United States in 1885 :

"Eighteen million bales of cotton were the equivalent in value of the entire interest-bearing national debt in 1865 (\$2,221,000,000); but it will take 35,000,000 bales at the price of cotton now (1885) to pay the remainder of such debt (\$1,196,000,000). Twenty-five million tons of bar iron would have paid the whole debt (\$2,674,000,000) in 1865; it will now take 35,000,000 tons to pay what remains (\$1,375,000,000) after all that has been paid."

"The inference, therefore, intended to be conveyed was, that the burden of the national debt of the United States in 1885, notwithstanding the large payments on the same during the previous 20 years, had really been increased, inasmuch as a greater effort of labor, or an increased amount of the products of labor, was now necessary to liquidate it than when the purchasing power of gold had not been depreciated through its scarcity; and, as with public debts, so also with private debts, especially such as are in the nature of mortgages on land or on other productive fixed capital.

"Now, in reply to this it is to be said, *first*, that the basis assumed for this comparison of prices was, in the case of cotton, entirely unfair and unnatural—the gold price of this commodity in the year 1865, owing to a scarcity occasioned by war, having been more than 250 per cent. higher than the average prices in 1866 before the war; while the price of iron for that same year in the American markets was also inflated on even a gold basis; and, *secondly*, that no consideration is given or allowance made in the above comparison for the results of labor at the two periods of 1865 and 1885; not more, and probably much less, actual labor in 1865-86 having produced 6,550,000 bales of cotton in the United States than was required in 1866 to produce 3,800,000 bales;

Debts not Increased by Demonetization.

while in the case of bar iron the proportion of days' labor to a ton of product has been diminished more than one half since 1865; and the same is true, also, of that more valuable product of iron—*viz.*, steel. Furthermore, no important product of the United States can be named in which the labor cost of production has not decreased very much more than has the gold price of the same between 1865 and 1885. In short, if the debtor has got more to pay at the latter than at the former period, it is not the fault of any change in the relations of the precious metals if he has not at the same time got correspondingly more to pay with."

We have quoted mainly from Mr. Wells; but those who hold substantially the same position are numerous.

"In the year 1886 the British Government created a 'commission' of persons of eminent qualifications to 'inquire into the recent changes in the relative values of the precious metal,' embracing causes and results. This commission, after devoting nearly two years to their task, calling to their assistance a large number of persons as witnesses, or experts, whom they regarded as qualified to express opinions, submitted a 'final' report in October, 1888, embodying the facts to which their attention had been called; a summary of the arguments, on the one side and the other, touching questions in controversy; and a marked diversity of conclusions on the part of the several members of the commission. There was, however, an entire unanimity of opinion on some points, which the commission express as follows :

"We are of opinion that the true explanation of the phenomena which we are directed to investigate is to

be found in a combination of causes, and cannot be attributed to any one cause alone. The action of the Latin Union in 1873 broke the link between silver and gold, which had kept the price of the former, as measured by the latter, constant at about the legal ratio; and when this link was broken, the silver market was open to the influence of all the factors which go to affect the price of a commodity. These factors happen since 1873 to have operated in the direction of a fall in the gold price of that metal."

In view of the above and a large amount of similar evidence which might be quoted (see also FARMERS' MOVEMENT; PRODUCTION), the gold advocates say it is plain that the one sufficient cause of the fall of price is improved production and means of transportation.

As to the silver argument, that, whatever be the cause, prices have fallen; that there is suffering, and that an expansion of the currency would raise prices and so relieve suffering, the gold advocates affirm that were silver to be coined, and suppose prices to rise (which they are not sure would happen), the effect would be, so far as the farmers are concerned, possibly to enable them to pay their debts in a depreciated currency, and so gain a little temporary questionable good, but at the same time to raise the prices of all the farmers buy, and stimulate their production, which would again bring down the price of their produce, leaving them no better off than before, and perhaps worse. As for wage-workers, it would raise their prices and not raise their income. For all classes, it would produce an appalling panic. Professor Laughlin writes in the *American Review of Reviews* for September, 1896 :

Panic.

"The reasons why a panic must follow a change of standard are clear. Business men are selling goods on time, and discount their bills at banks. To pay wages in his factory to-day he gets the present worth from the banks of the debts due him for goods sold. These sales and discounts are made at prices determined by the existing gold standard. Suggest a lowering of 47 per cent. in the standard, and imagine if you can the ensuing confusion. How can any kind of a business contract be made if it is not known within 47 per cent. what the value of the payment will be? No bank will loan the deposits left in their hands or renew old loans if there is fear that the repayment may vary by 47 per cent. And even before the change of standard could be enacted men would all wish to sell their securities and property for gold before the change to silver came about. If, then, every one is selling, and if the banks refuse to loan because of the uncertainty, picture but faintly the consequent distress and failures. One house, unable to get loans to meet its maturing notes, fails; that brings down another house; then all come crashing down in ruin. The horror passes all description—the hopes of a lifetime gone, homes sold, and beggary for wife and children. This would be the first effect of free coinage of silver; and already the faint possibility of it has forced down the prices of securities, in many cases to a point as low as in the panic of 1893.

"The results of a panic will be reduced production, lessened demand, rigorous economy, diminished transactions, idle capital, idle labor, general prostration, and the heaping up in banks of unemployed money. Less money will be needed for the lessened business. The demand for silver will be less than the present demand for gold, as a first result of free coinage."

To propose the monetization of silver to relieve the depression of the present is to propose to pour out gunpowder in order to check a slow fire. The real evil to-day is a lack of confidence in business, which would be relieved the moment a sound gold standard were accepted, and investors, capitalists, and producers were con-

vinced that they could get the worth of their money.

The possibility of the working of the bimetallic theory, that the monetization of silver can keep it on a par with gold, the gold advocates question under any circumstances, and utterly deny under the form of its monetization by the United States alone at a ratio of 16 to 1, when the market price is nearer 32 to 1. When France tried it, the relative value of the metals was very near its legalized monetary value, and most of the world was using silver. Even then it is by no means clear that the attempt was a success. (See Giffen's *The Case against Bimetallicism*.) For the United States to try and keep silver at par with gold at a valuation twice its worth as bullion, and with no other leading country in the world using it as legal tender, would be madness. Says Professor Laughlin (as above):

"The only possible means by which silver can be raised to par must then be the demand created solely by the United States. And this demand must be sufficient to raise the value of all silver in the world to par, not only in the United States, but in India, China, Russia, or France. And yet one of the first results of free coinage of silver will be to withdraw the support from under the \$625,000,000 of silver in the United States now kept at par with gold. With our present gold system, from 1878-93 our government purchased silver outright and withdrew it from the market, but

Fall of Silver.

kept it at par with gold. Our present legislation requires the Executive to maintain this silver at parity with gold, and so far this has been done. It has been a great help to the silver market that \$625,000,000 have been bought and kept at a value far beyond its bullion value. Now give us free coinage of silver, drive out gold, and it will be impossible to maintain the silver at par. Why? Because silver cannot be exchanged for gold money in any daily dealings; only silver will be paid in for duties; the treasury will pay in silver; and all government money and obligations will be valued by the kind of money in which they are payable. Our money, based only on silver, will have only the value of silver. This \$625,000,000 of silver will fall to its market value, just as the Mexican dollars, now used in commerce all over the world, altho containing more pure silver than our own dollars, pass for about 50 cents in gold. Free coinage of silver, therefore, will deprive \$625,000,000 of silver of its supporting gold prop, and it must henceforth stand on its own legs. The effect of this will be to depress rather than raise the value of silver.

"Under the acts of 1878 and 1890 it should be recalled that the United States was a direct purchaser of silver. It took taxes from us and bought silver with them. With free coinage of silver the government would not buy a dollar of silver. Free coinage of silver means the right of any owner of bullion to have it coined into dollars. When the mint merely stamps this bullion into coins it is not a purchaser. It receives the bullion, and returns it to the owner in form of coins. A great many people have been wrongly led to believe that the government would create a demand for silver by buying it at the mints at a fixed price."

Thus, even the United States would not create a government demand, and would only lead to a possible and precarious popular demand for silver, while all other civilized countries would have no more demand for it than now. The slight effect if any on the price of silver of the coining of \$400,000,000 under the Bland-Allison Act, and of the purchase of 4,500,000 oz. of silver per month under the Sherman Act of 1890, is well known. It scarcely prevented the steady fall of silver even for a while. The steady fall in the price of silver could at best only be prevented by international agreement, and even then by no means surely. The far better

way is to use gold as the sole standard of value, a standard commanding universal confidence, and on that firm basis to use as much private paper as business needs and wise banking considers safe. (See BANKS AND BANKING.)

England in 1817, Germany in 1873, Holland in 1875, France, Belgium, Switzerland, Greece (the Latin Union) in 1878, Austria in 1879, Italy in 1882, India in 1893, Russia (virtually) in 1896, have come to the gold standard. The only nations using silver as a standard are Japan, China, Mexico, and South America. The United States virtually declared for gold in 1853; her experiments with silver since 1878 have done her no good and have created only continual depression, even as the greenbacks of war produced the crisis of 1873.

The present depression, as far as the wage-workers and farmers are concerned, is exaggerated. It is true that we have the poor and the unemployed to-day, but not nearly so many in proportion to the population as formerly, while what we have are not nearly so poor as in the very periods some bimetallicists are fond of talking about. (For the facts, see WEALTH; WAGES.) Prices have fallen; but this means prosperity for those of small means not suffering, while, were there confidence to-day, business would leap into life exactly because prices are such as to command large demand. This is, above all, a question of the producing classes. Said Secretary Carlisle, in his address before the working men of Chicago, April 15, 1896:

"Whether the general business of the people shall be transacted with good money or bad money, whether the wages of labor shall be paid in a sound and stable currency, with full purchasing power in the markets where they are exchanged for the necessities of life, or in a depreciated and fluctuating currency, having no fixed value and therefore bearing no permanent relation to the current prices of commodities, are questions which affect the comfort and happiness of every home and the peace and prosperity of every community. While all are deeply interested in the settlement of these questions, it is unfortunately the case that all will not be equally affected by an erroneous decision upon them. The wealthy man, the man who has accumulated property or hoarded money, is always exempt from many of the most serious consequences of a financial or industrial disturbance. He has both means and credit, and while he may be subjected to much loss and inconvenience, neither he nor his family will be pinched by hunger or compelled to go without raiment or shelter.

"It is the poor man and the man of moderate means—the man who has not been fortunate enough to accumulate property or money, but who depends upon his wages or upon the products of his own labor for the means of supporting himself and his family—that always feels the first and most disastrous effects of a business or industrial depression, no matter whether it results from a depreciated and fluctuating currency or from other causes. Such a man has nothing to dispose of but his labor, and nothing with which to support himself or his family but his wages or the proceeds of his own labor, and any policy that even temporarily suspends or obstructs the industrial progress of the country by diminishing the demand for the products of labor, or by impairing the capacity or disposition of capital to employ labor, must be injurious to his interests and inflict more or less suffering upon all who are dependent upon him. . . .

"After struggling for more than a quarter of a century, through labor organizations and otherwise, to secure a rate of wages which would make the proceeds of a day's work equal to the cost of a day's subsistence for the working man and his family, you are asked by the advocates of free coinage to join them in destroying one half of the purchasing power of the money in which you are paid, and impose upon yourselves the task of doubling the nominal amount of your wages hereafter; that is, to struggle for another quar-

ter of a century, or perhaps longer, to raise your wages in a depreciated currency to a point which will enable you to purchase with them as much of the necessities of life as you can purchase now, and if, after years of contention, privation and industrial disorder, you should at last succeed in so adjusting wages that they would procure at the higher prices of commodities just what they will procure now at the existing prices, what would you have gained by the change from the old to the new conditions?

Effect on Wages.

"But the particular proposition now under consideration is of such great importance in the discussion of this subject that you must permit me to call your especial attention to the experience of the laboring people in our own country during the years immediately following the introduction of a depreciated paper currency in 1862, and also to the very low rates of wages which now prevail in countries having the silver standard of value, or the so-called double standard of value with coinage of silver at a legal ratio not corresponding with the commercial value of the metal. . . .

"Less than three years ago you saw our financial, commercial, and industrial affairs violently disturbed by the fear that the Government would not be able to maintain gold payments and that our currency would descend to a silver basis. You saw the operations of industry interrupted, banks failing, great commercial houses unable to meet their obligations, credit seriously impaired, mills and factories closed and thousands of laborers thrown out of employment, and a state of panic and business disorder prevailing in every part of the country. If a mere doubt as to the kind of money we intended to use produced these distressing results, what think you would be the probable consequences of a deliberate determination upon the part of our people to adopt silver monometallism as a permanent system? The imagination can scarcely conceive the deplorable state of society that would immediately follow the announcement of such a policy."

Revised by DAVID A. WELLS.

MONOPOLIES.—A monopoly in industry may be defined as the control of some natural agent, of some line of business, or of some advantage over existing or possible competitors, by which greater profits can be secured than other competitors can make. We shall treat the subject in this article from three standpoints: first, from the standpoint of those who believe in the control of monopolies, by the State; secondly, from the standpoint of those who believe in the ownership and conduct of monopolies by the State; thirdly, from the standpoint of those who defend monopolies, or who believe that they are but the result of the present legal constitution of society, and would, therefore, remove any evils that may result from them, not by attacking monopolies by themselves, but by attacking the causes which produced at least their evil feature. (For the facts and statistics of present monopolies, see TRUSTS.)

For the first point we present an article prepared for this encyclopedia by Mr. C. W. Baker, author of *Monopolies and the People*:

I. PUBLIC CONTROL.

"There is perhaps no point in which the modern science of economics differs more widely from that science as taught by the early writers on political economy than in its treatment of the subject of monopolies. This does not mean that the teachers of the older school were in error, or that the newer school has departed from correct principles or practice. It simply means that since the days of Adam Smith a

whole vast revolution has been wrought in the world of industry, commerce, and finance. The new political economy recognizes these changed conditions and seeks to lay down the principles and rules which govern them. Until the modern era the only monopolies were those which were established by royal grants, relating to the manufacture or sale of some particular commodity. In early English history the sale of monopolies furnished a principal means for replenishing the royal exchequer. Naturally such monopolies, operating to lay a grievous and well-realized tax upon the people, were bitterly opposed; and not a small part of the popular enmity to monopolies which still remains, voiced in such common expressions as 'competition is the life of trade,' dates back to that era, before the modern system of manufactures and transportation had had its beginning.

"The monopolies of the present day may be divided into two classes, designated respectively as natural monopolies and artificial monopolies. Examples of natural monopolies are transportation lines, including not only steam and street railways, but the pipes and wires in city streets along which water, gas, steam, or electric current are distributed. In short, natural monopolies

Nature of Monopolies.

may be defined as those industries in which the number of competitors which can engage in the business on equal terms is limited to a very few. Artificial monopolies are those in which the number of possible competitors is large; but the advantages and economics arising from production on a large scale and doing away with competition are so great as to induce concentration of the industry into one organization under a centralized management.

"Both these classes of monopolies are outgrowths of modern conditions; railways and other modern systems of transportation, as well as the mechanism for distributing heat, light, power, water, etc. from central stations, were all unknown a century ago. So also the modern factory system and a thousand other modern conditions which make possible such monopolies as the cordage trust or the sugar trust did not exist a century ago. In fact, most of these conditions have arisen during the past twoscore years. It is not strange at all, therefore, that the theories and laws laid down by the old school of political economists need to be supplemented and amended; and this is the work which the new school of political economy has done and is doing.

"The most important laws of modern competition have been stated as follows:*

"1. In any given industry the intensity of competition tends to vary inversely as the number of competing units.

"2. In any given industry the waste due to competition tends to vary directly as the intensity.

"3. In any given industry the tendency toward the death of competition (monopoly) varies directly with the waste due to competition.

Laws of Monopoly.

"4. In any given industry the tendency toward the death of competition (monopoly) varies inversely with the number of competing units.

"5. The intensity of competition tends to vary directly in proportion to the amount of capital required for the operation of each competing unit, especially when the interest on the capital invested forms a large proportion of the cost of production.

"6. In any given industry the tendency toward the death of competition (monopoly) varies directly with the amount of capital required for each competing unit.

"7. In any given industry in which natural agents are necessary, the tendency toward the inequality of competition (monopoly) tends to vary with the scarcity of available like natural agents.

"Study of these laws and study of the facts on which they are based leads to the inevitable conclusion that monopolies of every sort are the result of the conditions of modern civilization.

"To put this truth in another form: The tendency of modern industry is to production on the largest scale; to the concentration of a thousand looms in a single factory, of a hundred factories under a single management, and of the introduction of such economical systems of production, distribution, and sale that it is hopeless for a single small producer to undertake a competition with it. So also with reference to the

* *Monopolies and the People*, pp. 150-54, Putnam's (1889).

class natural monopolies; there are vast advantages in distributing light, heat, and power to the inhabitants of cities from central stations, and in concentrating the flow of commerce on great railway lines.

"The social system which the old school of economists studied was a great aggregation of units to a great degree independent of each other. The social system of the present day is a vast organism in which each individual, each community, each State, each nation has its prosperities and destiny indissolubly interwoven with the prosperities and destiny of every other one. It is true now in a larger and broader sense than ever before that no man liveth to himself.

"Monopolies, then, are a necessary condition of our modern civilization. We can no more go back to the economic simplicity of our grandfathers than we can dispense with the railway, the telegraph, the ocean steamer, the power loom, and the reaper in our industrial life. But while the existence of monopolies, or, in other words, the absence of competition is inevitable, it by no means follows that this existence need involve injury to the welfare of the people. In fact, it is as much out of the question that the public should permanently submit to paying such prices for the necessities of life as the owners of monopolies choose to ask, as it is that it should dispense with the great inventions which have conferred such enormous benefits upon the world, and have in so doing altered the economic conditions of society.

"Let us see first how the problem is being solved in the case of natural monopolies. Here a whole revolution has been wrought in public opinion, in jurisprudence, and in actual practice during the past score of years, and the change has been largely effected during the past decade. Competing railways, competing gas works in cities, competing telegraph companies have swallowed up a vast amount of wealth, much of which is now a total waste. The world is wiser now. Railway rates have been declared subject to regulation by State legislatures and by State and interstate railway commissions. The community or individual discriminated against by the railways has a tribunal which will hear his grievance and protect his interests. In Maine and in Massachusetts new railways cannot be built merely to stall traffic from an established road. Those who propose the construction of a new railway must prove before the State railway commission that the public exigency requires the construction of the new line. It must not parallel an existing road able to handle the traffic, for it is rightly reasoned that it is better for the public that the existing road should do the whole work and devote the surplus revenue to improved service, or else that it should lower its rates to such a point as will pay it only a reasonable profit on its capital invested.

"Again, it is very seldom now that we hear of city streets being torn up to lay gas mains of competing companies; and where subways are being laid by cities for the accommodation of electric wires, it is the practice either for the municipality itself to carry on the work or to grant an exclusive franchise to a company to perform the work, requiring it to grant equal privileges to all at a fixed rate of rental.

"Franchises for the use of city streets for street railways, electric lighting companies, etc., are now very generally limited to a short term of years, a percentage of the gross receipts is paid by the company to the city, and the rates to be charged are fixed in the contract. The ownership of water-supply systems by the municipalities which they serve is rapidly increasing. The few instances of the ownership of sewerage systems by private companies are rapidly decreasing. Municipal ownership of gas-lighting plants shows no increase; but the newer lighting agent—electricity—has grown rapidly in favor with the public, and municipal electric-lighting plants furnishing lights for streets and city buildings number nearly or quite 100 in the United States. That furnishing of electric light to private users is likely to follow there can be little doubt.

"With regard to all these movements, it is to be distinctly noted that it is not so much municipal ownership and operation that is being sought for as municipal control. The old plan of giving away city streets in perpetuity to the first company which volunteered to lay in them the arteries of modern municipal life finds few or no defenders nowadays. On the other hand, most city governments are ill adapted to carry on complicated business affairs. For example, a city has great advantages in operating directly an electric-

lighting plant, in that it can borrow capital at a lower rate of interest than a private company, can always prevent competition from being established, and can secure for itself the profits arising from the use of its streets. On the other hand, these advantages may all be neutralized by the choice of incompetent or dishonest managers.

"There are many people who immediately go on to generalize from this fact, and to lay down the broad statement that, in view of prevailing corruption in city politics, the chances of either incompetent or dishonest men being placed in charge of municipal business is so great that municipalities should not undertake such work as public lighting, street railway service, or even public water supply. It is doubtful, however, whether so broad a statement is warranted. The fact is almost universally overlooked that waste, incompetence, favoritism and dishonesty of various degrees is exceedingly common in the carrying on of the business of private corporations. The common argument is that the men who administer the affairs of cities are put in their places by the accidents of politics, and that even if they and their appointees are honest, they are likely to lack either the experience or the ability necessary to economically administer complicated enterprises. But to some extent the same thing is true of modern corporate activity. It is an open secret that favor and not merit is the reason for the bestowal of lucrative official position in many great corporations. The real owners of great corporations are in many cases a host of scattered individuals, while those who actually control and manage them do so to further the interests of themselves and their friends. Put briefly, public office is not held as often as it should be as a public trust, but corporate offices are also too often considered a private snap.

"To sum up, then, the most generally approved methods of dealing with natural monopolies at the present day are for municipalities to either own and operate them, or to own the fixed plant and lease them for operation for short terms of years to the most favorable bidder, under such restrictions and no others as are necessary to secure efficient and reliable service. In case a city is unsupplied with electric light or with street railway service, it can best secure the construction of a plant by granting a franchise for its construction on specified plans, and its operation for a limited term of years to a private company, the plant to become the city's property at the expiration of such term on payment of its actual value, exclusive of the franchise or good will. In the construction of water works, experience generally favors the city's undertaking the work directly, provided its finances permit.

"In general railway service, control of rates and service by special public commissions is now firmly established as the method of dealing with railway corporations. The progress of railway consolidation during the past few years has entirely established the futility of relying on competition in this industry to secure proper facilities and protection against exorbitant rates and unjust discriminations.

"Turning now to artificial monopolies, it must be said that no such progress can be recorded in dealing with the problem which they present as has been made in dealing with natural monopolies. These monopolies are still too new a feature of our industrial life to be understood and appreciated in their full significance by even the educated and intelligent. Legislators are still trying to legislate them out of existence; and the courts, or many of them, are still laying down the old common-law principle that contracts to restrain competition are against public policy, and hence void and unenforceable, in the hope of preventing the growth of this class of monopolies. Such legislation and such decision has its use at the present day, undeniably, in checking and retarding the growth of such monopolies, until better methods of dealing with them can be developed. But that concentration of production and concentration of distribution is destined to go on, no one who studies in the broad aspect present and prospective conditions in industry and commerce can doubt. That monopoly, or at least a strong tendency toward the limitation and control of competition, is an inevitable result of this concentration, follows from the laws of competition already enunciated.

"The reform which is taking place and is to take place with reference to monopolies, then, is by no means their abolition. The reform needed is to uproot from the public mind the persistent idea that monopolies are essentially evil, and to plant in its stead the truth that they are the inevitable accompaniment of the new civilization on which the world

Present Solution.

Public Control.

Artificial Monopolies.

is entering. The social system has grown out of chaos with competition, or, as the student of natural science expresses it, the survival of the fittest, as its mainspring. In a large and true sense competition is destined to remain an operative factor of vast importance in the activities of the race. But in many industries—how many none can now prophesy—it seems destined inevitably to disappear, and with that disappearance in any industry the public welfare demands that something be devised to take its place. When this truth once comes to be realized by people at large, the popular fear of and prejudice against monopolies will disappear. The remedy for monopoly is not abolition, but control, is the truth which needs to be taught, and when it is taught and comprehended the way will be opened for new advancements in the world's industries and activities, which have never been possible under the cruder civilization of our fathers."

II. PUBLIC OWNERSHIP.

Many dissent from the views expressed in the above article, believing that the public control of monopolies is impossible, and even if possible, not the best way to secure the desired results. Public control, they believe, may serve for a while, as a transition state, but as soon as practical at least they believe further control should give way to public ownership. The experience of the Interstate Commerce Commission (*q. v.*), they affirm, shows that the United States cannot control the railroads unless it also owns them. Many railroad men concur in this opinion. (See RAILROADS.) This indicates a principle, the believers in public ownership assert, which, tho developed first in railroads on account of the magnitude and concentration of the interests involved, must sooner or later appear in all monopoly. Public control, they argue, has most of the difficulties without many of the advantages of public ownership. We shall develop this view by quotations from a tract on *The Public Ownership of Monopolies*, by Professor Frank Parsons. It may be done briefly, however, because the subject will be found developed in some detail as applied to the various concrete subjects of RAILROADS, GAS, ELECTRIC LIGHTING, STREET RAILWAYS, TELEGRAPH, TELEPHONE, etc. (See NATURAL MONOPOLIES.) Professor Parsons says:

"The war upon monopoly is in defense of the very principle for which our fathers fought and bled and conquered in the Revolution, for a monopoly in private control means taxation without representation, and that is a power which no legislature has a right to grant to any man or set of men—a power which no one should be permitted to exercise in a free country, for 'taxation without representation is tyranny.'

"It makes no difference whether the people are compelled to pay the tax by the power of their necessities or by the power of the sheriff. When the coal combine raised the price of coal last year on an average 20 cents a ton, it levied on the United States a monopoly tax of \$3,000,000 on the annual output of 45,000,000 tons, because the combine was already receiving heavy prices for its coal, and the cost of mining it is not increasing, but diminishing every year. Vice-President Holden, one of the leaders of the combine, testified before the New York Senate Investigating Committee that in 'advancing the price of coal the cost of production or transportation is not considered at all,' the price 'has nothing to do' with the cost. It will not do to say that people need not buy coal if they think the price is too high—they have got to buy coal, it is only because of the necessity of the case that the combine is able to collect its exorbitant rates. Look at the Western Union paying 100 per cent. dividends in the darkest days of the war, and averaging, from its organization to the present time, 300 per cent. per annum on its original stock. No wonder the owners of these monopolies became polymillionaires. No wonder Jay

Gould remarked that he had rather be president of the Western Union than of the United States. If these magic methods of accumulating riches were equally diffused it would not be so bad, but the farmers cannot put their hands into Uncle Sam's pockets and take out whatever they choose, as the monopolist can. The farmer and the mechanic sell at competitive prices and buy at monopoly prices. The telegraph men and the coal men sell at monopoly prices and buy at competitive prices. No wonder the former grow poor and the latter unconsciously rich. Not only is monopoly in private control unjust, as enabling its owner to compel the people to pay more than a labor equivalent for the service he renders, not only is it the most powerful influence for corruption and for hastening the concentration of wealth in the hands of a few selfish schemers, not only is the growth of private monopoly the greatest danger of the Republic, but, upon the plane of actually existing laws, so far as any monopoly rests upon a grant from the government, it is absolutely unconstitutional, and so far as it rests upon agreements among men, or the natural limitation of property, it calls for State interference according to undisputed principles of the common law. As we have seen, and as the American public knows to its cost, a monopoly in private hands gives its owner the power to collect from consumers more than the value of what they receive—he could charge the fair value of the service he renders without a monopoly; the advantage of monopoly—the reason men struggle so hard to obtain it, is the power it gives to charge more than that value; in other words, a private monopoly confers the inestimable privilege of demanding something for nothing, and involves the power of taxing the people for private purposes, a power which the legislature cannot lawfully confer upon any man or set of men, because it does not itself possess any such power. It can tax, or authorize taxation, for public purposes only (United States Supreme Court, 20 Wall 664; 106 U. S. 487; 58 Me. 590; 2 Dill. 353; Cooley on Taxation, ¶ 116, and cases cited), and taxation for the benefit of an enterprise in private control is not for a public but for a private purpose, and is beyond the sphere of legislative power (Judge Dillon in 27 Ia. 51, and 58 Me. 590).

"It makes no difference whether the Constitution limits the power of the legislature to public purposes or not, the grant of a monopoly is, according to the clearest principles of jurisprudence, entirely beyond the utmost power of any legislative body in a free country.

"The provisions of the Constitution are not the only limitations on legislative power. There are others that inhere in the very substance of republican institutions—'implied reservations of individual rights, which grow out of the essential nature of all free governments' (the U. S. Supreme Court in 20 Wall. See also Judge Dillon in 27 Ia. 51; 25 Ia. 540; and 39 Pa. St. 73). These cases and many others declare that legislative power is limited by the great principles of justice for the enforcement of which government is instituted, that acts in violation of these principles will be held void by the courts, altho no provision of the Constitution can be found to condemn them, and that the taking of A's property to give it to B, or the identical act of giving to B a power whereby he may help himself to A's property is beyond the limits of legislative authority. And what the legislature cannot lawfully do directly, it cannot lawfully accomplish indirectly under the guise of a franchise. The settled principles of the law logically carried out would render utterly void every franchise in existence. Even the sovereign power of Queen Elizabeth was held incompetent to create monopolies (Case of the Monopolies, 11 Coke, 84b), because they were detrimental to the interests of the people. And if the 'divinely commissioned ruler' of the people may not inflict this injury upon their interests, by what authority can it be done by the servants of the people, elected to conserve their interests, not to defeat them? An agent must be loyal to his principal's interests, and the moment he ceases to be so his authority vanishes—that is bed rock in the law of the civilized world.

"All this is clear, and yet our judges would probably hesitate to declare a legislative franchise void to-day even if the argument against its validity were fully and strongly urged. And they would hesitate because of the long line of such enactments in the past and the disturbance that would be caused by an adverse decision at this late day. And yet it is perfectly manifest that the fundamental principles of a Republican government are broken every time a franchise is granted, and every

Unconstitutionality.

moment a monopoly is maintained by aid of the law instead of being swept into the list of crimes, as it should be. The people are bitter in their denunciation of trusts, and Congress has passed severe laws against them for the sole reason that they are monopolies. Whereby we have the serio-comical spectacle of a government creating monopolies with one hand and endeavoring to choke them with the other—declaring absolutely void all monopolies formed by agreement among men, because monopoly is in its nature contrary to public policy, and sustaining exactly similar, in some cases identical monopolies established by the agents of the people without an atom of authority to do it, but through a flagrant breach of their trust and in violation of the fundamental principles of free institutions, which even the direct vote of a majority of the people would have no right to overcome or alter.

"The remedy does not lie in killing the trusts and franchises—we could not if we would, for monopolies are formed in obedience to a law superior to any that Congress can make—the law of industrial gravitation. Internally monopoly means cooperation instead of conflict, wise management instead of planless labor, economy instead of waste—it is not monopoly we object to, but monopoly in *private* control. The true remedy is *public ownership* of monopolies. That will retain the economies of concentration and remove the evils of overgrown private power—keep all that is good, kill only what is evil. We are bound to have monopolies; the only question is whether they shall own the public or the public own them."

Of the practical working and perfect feasibility of the public ownership and operation of monopolies Professor Parsons gives numerous instances. Railroads, telegraphs, telephones are publicly owned and managed in most of the civilized countries of the world, and usually with complete satisfaction. There is scarcely an instance where an industry which has once reached the stage of public ownership and management has

reverted to private hands. The tendency is all the other way.

(For instances, see RAILROADS; TELEGRAPHS, etc.) Public ownership is almost invariably cheaper, as far as accommodations go; it serves the public convenience and not the interests of stockholders. In a few instances, as in carrying mail or express parcels between great cities, private companies do it cheaper than State monopolies for two reasons: 1. Private companies pay lower wages to their employees and work them usually longer hours, hence they can afford to do work cheaper. 2. Private companies only carry mails, etc., *where it pays*; the State carries mail, etc., to little villages and country districts where it does not pay. Both these considerations are arguments for public ownership. As for the statement that public operation, in the United States especially, is impracticable because of the corruption of government, socialists argue that it is the private ownership of monopolies which is the main source of public corruption. (See MUNICIPALISM.) A tract published by the American Fabian Society (*What Socialism Is*) says on this point in brief:

"We have been schooled in America to despise government activities. The natural result is that our cities are ruled by the worthless and base. These sell franchises and legislation to the corporations. Under the present system, too, a corporation can scarcely help being corrupt, because it must get charters, franchises, or legislation. If it does not buy these some other corporation will. The present system handicaps honesty. Pure government, as business today is constituted, is almost impossible. We must adopt the European method of having the city do great things, if we would have European results. Socialism is the practical way of getting good city government."

It is sometimes said that public ownership of natural monopolies (*q. v.*) is practicable, but not of other monopolies. To this believers in the public ownership of all monopolies answer: It is true that natural monopolizers lend themselves most readily to public ownership exactly because they lend themselves most readily to monopoly; but any line of business can in time develop, and many of them are developing monopolies. When any line of business reaches the stage of monopoly, then it should be first controlled and finally taken over by the public.

Mr. Sidney Webb, in the *Fabian Essays*, gives hundreds of instances of all kinds of industry successfully conducted by government. He says (speaking of Great Britain):

"Besides our international relations and the army, navy, police and the courts of justice, the community now carries on for itself, in some part or another of these islands, the post-office, telegraphs, carriage of small commodities, coinage, surveys, the regulation of the currency and note issue, the provision of weights and measures, the making, sweeping, lighting, and repairing of streets, roads, and bridges, life insurance, the grant of annuities, shipbuilding, stockbroking, banking, farming, and money-lending. It provides for many thousands of us from birth to burial—midwifery, nursery, education, board and lodging, vaccination, medical attendance, medicine, public worship, amusements, and interment. It furnishes and maintains its own museums, parks, art galleries, libraries, concert-halls, roads, streets, bridges, markets, slaughter-houses, fire-engines, lighthouses, pilots, ferries, surf-boats, steam-tugs, life-boats, cemeteries, public baths, wash-houses, pounds, harbors, piers, wharves, hospitals, dispensaries, gas-works, water-works, tramways, telegraph cables, allotments, cow meadows, artisans' dwellings, schools, churches, and reading rooms. It carries on and publishes its own researches in geology, meteorology, statistics, zoology, geography, and even theology. In our colonies the English Government further allows and encourages the communities to provide for themselves railways, canals, pawnbroking, theaters, forestry, cinchona farms, irrigation, leper villages, casinos, bathing establishments, and immigration, and to deal in ballast, guano, quinine, opium, salt, and what not. Every one of these functions, with those of the army, navy, police, and courts of justice, were at one time left to private enterprise, and were a source of legitimate individual investment of capital. Step by step the community has absorbed them, wholly or partially, and the area of private exploitation has been lessened."

III. CONTRARY VIEWS.

Some to-day defend private monopolies, and others argue that they are not to be either attacked themselves or assumed by the public, but to be broken up so far as they are evil by attacking their causes. As an example of the first of these views, we give a supposititious statement of the defense of monopolies printed by Mr. Baker in his *Monopolies and the People* (pp. 9-22). Mr. Baker says:

"It is safe to assume that the reader is somewhat familiar with the general charges which have been brought against the trusts; but even if this side of the story has not been heard, it is not unfair to look at them first from the standpoint of the men who make and manage them. In order to do this, suppose we select some particular trust which will serve as a type, and imagine that some frank, candid manufacturer, who is a member of this trust, comes before us to give an account of its formation and operations. This man comes, we suppose, not as an unwilling informant, or as one on trial. He is frank, honest, and plain-spoken. He talks as man to man, and gives us, not the specious argument of an eloquent pleader in defense of trusts, but just that view of his trust and its work that his own conscience impels him to take. Certainly, then, he deserves an impartial hearing.

"A number of years ago the principal manufactur-

ers of linseed-oil in the United States formed an association. It was started largely for social ends, and was very successful. Business men are generally most interested in their own plans and operations; and those who are familiar with the same topics and have similar interests and purposes are apt to make agreeable companions for each other. We discussed many points connected with the management of our business at the meetings, and by interchanging with each other our views and experiences with different devices, methods of management, etc., we were able to get much valuable information, as well as social pleasure, from meeting one another.

"Now within the past few years things have been going from bad to worse with the manufacturers of linseed-oil. The long and short of it all was that the margin between the cost of the raw seed and running our mills, and what we could get for the oil cake and the linseed-oil in the market, has grown exceedingly narrow. It's hard to tell just what has caused it. They say over-production; but what has caused the over-production? One thing that may have had something to do with it is the new mills they have been putting up in the Northwest. Many of the Eastern mills used to get large quantities of seed from Iowa; but they are building cities out there now, as well as raising flaxseed, and when they were booming some of those cities they would raise heavy bonuses in aid of new enterprises. Among these were some great linseed-oil mills, which have loaded up the market pretty heavily of late years; so that not only has the price sagged down, but we have all had to work to get rid of our stocks. The firms which had the best mills and machinery, and were in a position to get their seed reasonably and put their goods on the market with least expense for transportation, etc., have been making a small profit over and above their expenses. But some of the works which had to bring their seed a long way, and which haven't quite as good machinery as can be had now, were in a bad way. There were some of the oldest houses in the trade among them, too, and with fine men at their head. It was too bad to have them go under. They tried to cut down expenses, but strikes and trouble with their men prevented their saving much in that way. Then there was one item of expense which they had to increase instead of cutting down: that was the cost of marketing. Competition was so fierce, that, in order to keep up their trade, they had to spend more on salaries of expensive salesmen, and in advertising and pushing their goods, than they would dream of ordinarily.

"It seemed too bad to cut each other's throats in that way, for that was what it amounted to, and when the association met—or what was left of it, for the business rivalries had grown so bitter that many of the former personal friendships between the members had become strained and one after the other had dropped out—the situation was discussed by the few members who met together. It was discussed earnestly, too, by men who felt an interest in what they said, because unless some remedy could be devised, they had got to sit still and watch the savings of a lifetime slip through their fingers. One thing was very clear to all. The competition was as sharp as any one could possibly wish, the public was not getting such a wonderful benefit after all. Prices were not so very much lower for oil, nor higher for seed. It was the selling expense which had run up to a ruinous figure; and on one point all the members were unanimous—that if all the firms in the trade could only work together in harmony in marketing their goods, they could save enough in salesmen's salaries, etc., to make a great difference in the profit-and-loss account without affecting the selling prices in the market one penny.

"Another very important matter, which we had to handle pretty tenderly in our discussions, was that of adulteration.

Argument for Monopolies.

I must confess that a good many firms in the trade, who used to be above any thing of the sort, have been marketing some goods in the past few years which were not exactly the "pure linseed-oil" which they were labeled. It's a mean business—adulteration—but not many of our customers ever test their purchases. The one thing they are apt to look at is price, for they are buying to sell again; and when rivals are selling a cheaper oil that seems just as good until it is laid on as the pure linseed that you are obliged to ask a higher price for, the temptation to meet them at their own game, rather than lose your old customers, is a very strong one. Certainly, when competition took this form, it hurt the public even more than it hurt us. When people wish to buy pure linseed-oil they ought to have some prospect of getting

it, instead of getting an adulterated mixture of various substances; but at the rate competition was running, there seemed to be small prospect that there would be any really pure linseed-oil put on the market in a short time. We have often discussed the possibility of stopping these adulterations, but it was a hard matter to cure by mere mutual agreement. How do I know what my competitor in a city 100 miles away does with the vats in his cellar after working hours, even if he has solemnly agreed not to adulterate his goods? For I must confess that there are a few men in our trade who are as tricky as horse jockeys.

"Quite a number of improvements have been patented in linseed-oil machinery in the past 20 years. Nothing wonderful, but things that effect little economies in the manufacture. We could have done without them; but when a few firms took them up, of course the rest had to follow suit, or fall behind in the race of competition. We have had to pay a heavy royalty on some of these machines, and it has been rather galling to count out our hard-earned dollars to the company which has bought up most of the patents, and is making 100 per cent. a year on what it paid for them, with no risk, and without doing a stroke of work. Now if we manufacturers could work in harmony, we could make this company come down from their high horse, and they would have to ask a reasonable price for their machines. But we could do more than this. It stands to reason that a good many improvements will be made in our machinery in the future. We don't object to paying a fair price to any inventor who will work out these new ideas for us; but it does seem unjust for him to go and sell them to some outside company for a song, and have that company bleed the users of the improvement for every ounce they will stand. Now, by working together, we can refuse to pay royalties on anything new which comes up; but require, instead, that any new patent in our line be submitted to a committee, who will examine and test it; and if they find it to be of value, will purchase it for the use of all members of the association.

"Some of the members thought this was as far as we ought to go. They were opposed to "trusts" on principle. But the great majority saw so clearly where we could continue to better ourselves that they became enthusiastic over it.

"Some speculators, in years of short crops, have occasionally tried to "corner" flaxseed in a small way. We could refuse to buy except directly from the growers, and that branch of speculation would be a thing of the past. We have sent out some pretty sharp men as buyers, and sometimes they have bought flaxseed in some of the backwoods districts at very low rates. At other times, two buyers from rival firms have run counter to each other, and paid prices larger than their employers could really afford. But with our combination, we cannot only fix uniform prices for seed, but we can send out only enough buyers to cover the territory; and the work of buying is reduced to simply inspecting and weighing the seed.

"Now another thing: Of course, not every manufacturer in the business owns his mills. It is a fact that since the close times of the past few years the majority of the firms are carrying mortgages on their mills; and some of them in the West are paying as high as 8 or 10 per cent. interest. But with the combined capital of all the firms in the trade at our back, we can change all that. Either by a guaranty, or by assuming the obligations, we can bring the interest charges on every mill in the association down to 4 or 5 per cent. at most.

"We have been paying enormous rates to fire insurance companies. They are not as familiar with our business as we are ourselves, and they don't know just how much risk there really is; so they charge us a rate which they make sure is high enough. We can combine together and insure ourselves on the mutual plan; and by stipulating that each firm shall establish and keep up such precautions against fire as an expert may direct, we cannot only reduce the cost of our insurance to that of our actual losses, but we can make these a very small amount.

"It may be said that we might have done all these things without forming any trust to control prices. But the practical fact was that we could not. There was so much "bad blood" between some of the different firms in the business, from the rivalry and the sharp competition for trade, that as long as that was kept up it was impossible to get them to have anything to do with each other in a business way. It was no small task to get these old feuds patched up; but some of the best and squarest men in the business went right into the work, and at meetings of the asso-

dition, and privately, exerted all their influence to forward this coming together for mutual aid and protection. They did it conscientiously, too, I think, believing that it was necessary to save many of us from financial ruin; and that we were not bound, under any circumstances, to sacrifice ourselves for the sake of the public. The trust has been formed, as every one knows, and many of the things we planned to do have been already accomplished. We have stopped adulterations on all goods made by members of the trust; and the improvement in the quality of linseed-oil which has been effected is an important benefit to the public. We are managing all the works in the trust as if it were all a single property, controlled by different managers; and the saving in expense, over the old plan of cut-throat competition, when everybody was striving to save himself and sink his rivals, is an enormous one.

"One thing which has caused much hue and cry is the fact that we have closed half a dozen mills or so. But the matter stood in this way: these mills were not favorably situated for doing business, all things considered; and all the mills in the country cannot run all the time, because there are more mills in existence than are needed to supply the market. These mills must have been closed soon, if the trust had not commenced operations, because they could not be run under the old *régime* and pay expenses. We knew we could make the oil at a less cost in our other mills, so we concluded to buy out the owners of these at a fair price, and shut up the works. Prices of linseed-oil have been raised somewhat, we confess; but we claim that they had been forced down much too low, by the excessive competition which has prevailed for a few years past. Of course some of the most hot-headed and grasping among us were anxious to force prices away up, when they once realized that we had an absolute monopoly of the linseed-oil trade of the country; but the great majority were practically unanimous in a demand for just prices only, and the adoption of the policy of live and let live; for trust-makers are not entirely selfish.

"We claim, moreover, that we are breaking no legal or moral law by this action. We are, for the most part, private parties or firms—but few corporations—hence the attempt to abolish trusts on the ground that the corporations composing trusts have exceeded the power given by their charters will fail to reach our case. We have certainly done this: we have killed competition in the linseed-oil trade; but we submit that with so many other interests and trades organized to protect themselves from outside competition, and control the prices at which their products are sold to the public, we were, in self-defense and for our own preservation, obliged to take this step.*

"If we omit the references to the especial trade, the above view of a trust from the trust-makers' standpoint will do for almost any of the many combinations which have been formed by different manufacturers for the purpose of controlling production and prices. One thing is clearly indicated in the above, and will certainly be conceded: that the men who have formed these trusts are animated by the same motives as those that govern humanity in general. They have, in some cases at least, known what it was to be crowded close to the wall by severe competition. They all at once saw a way opening by which they could be freed from the worries and losses which had been making their business one of small and uncertain profits, and would be set squarely on their feet with a sure prospect for large and steady gains. It is using a common expression to say that they would have been more than human if they had refused to improve this opportunity. Certainly, then, in examining further the trusts, we shall do so with no feeling of personal prejudice toward the men who originated them and carry them on.

"As we have given a hearing to the case from the trust-makers' standpoint, it is only fair that we should

hear at equal length from the public who oppose the trusts; but to abbreviate the investigation, let us suppose that we are already familiar with the various charges which are brought against the trust monopolies, and let us proceed at once to consider the actual effect of the trusts upon the public.

"Since we have heard so much in defense of the linseed-oil trust, it will be well for us to inquire concerning the results, in which the public is interested, which have followed its organization. During the year 1887 (the trust was formed in January of that year) the price per gallon of linseed-oil rose from 38 cents to 52 cents; and this price was kept up or exceeded during 1888. That is to say, every purchaser of linseed-oil, or every one who had occasion to have painting done, pays to the members of this trust, for every gallon of oil that he uses, about 14 cents *over and above* the sum which he would pay if competition were allowed to do its usual work in keeping down prices.

"What profits are the members of this trust making? Let us suppose that they were just able, at the old price of 38 cents per gallon, to pay all their running expenses and 4 per cent. on the capital invested, making nothing for profits beyond a fair salary to the managers of the business. Then the gain of 15 cents a gallon in the selling price is *clear profit* to them. Now add to this the fact, which was plainly brought out in the foregoing supposed statement by a member of the trust, that it is possible by means of the trust to greatly reduce expenses in many directions as well as to increase receipts, and we begin to form some conception of the profits which this trust is harvesting. If we wish to put the statement in figures, suppose we take the annual consumption of linseed-oil in the country at 30,000,000 gals. Then the profits of the trust from the increased prices alone will amount to \$4,500,000 per annum.

"There is another way in which trusts directly affect the public, which has received very much less attention than it deserves. Besides the people who use the linseed-oil and pay the trust an extra 14 cents a gallon for the privilege, there are a great number of people who would have used oil if the price had not advanced, but who cannot afford to do so at the advanced price. It is a well-known fact that every increase in the price of any article decreases the demand, and the advance in the price of linseed-oil has undoubtedly had a great effect in decreasing the consumption of oil. So while it is undoubtedly true that *at the trust's prices* there are more linseed-oil mills in the country than are needed to supply its wants, yet if the prices were lowered to the point which free competition would fix, there would probably be demand enough to keep all the mills running. To the trust, then, must be ascribed the final responsibility for the stoppage of the mills and the loss of employment by the workmen. Nor does the effect upon the labor market stop there. From the fact that less people can afford to paint their houses, because of the higher price of the oil, it is certain that there will be less employment for painters; and as less paint is used, all those interested in and employed in the paint trade are sufferers. It is to be remembered that we are speaking of the linseed-oil trust only to make the case more vivid. The principle is general, and applies equally well to other trusts, as, for instance, to the loss of employment by thousands of men working in refineries controlled by the sugar trust, in the fall of 1888. Still another effect of this trust's action is to be especially noted: the fact that the diminished production of oil lessens the demand for seed; and also that in the purchase of seed, as well as in the sale of oil, the trust has killed competition. The trust may, if it chooses, fix uniform prices for the seed which it purchases; and the farmer can take the prices they offer or keep his seed. Fortunately the farmer can raise other products instead of flaxseed, and will do so if the price is lowered by any large amount.

"One other possible mode of profit for the trusts, which, however, they are hardly likely to engage in—from their fear of public opinion, if for no other reason—lies in the power which they possess over the labor market. It will probably be conceded at once that the rate of wages in any occupation depends, among other things, upon the competition of the various workmen who seek employment in that occupation, and also upon the competition among those who wish to hire men to work at that occupation. It is plain that when the competition among employers to secure men is active, wages will rise; and when this competition falls off, wages will fall. Now the trust is more than a combination for selling purposes only. It is a combi-

The Answer.

* It should be explained that the above is not given as a *bona-fide* statement of facts concerning this especial trust, but as a vivid description of the organization and plans of a typical trust, from the standpoint of its owners and managers.

Probably, too, few or no existing trusts have tried to benefit themselves in so many different ways as we have supposed this imaginary trust to have done. But to shorten our investigation, the author has purposely extended the scope of this trust's action, to bring out clearly the variety and importance of the methods by which a trust reaps profits, aside from any advance in the price of its product.

nation of all the properties concerned under practically a single ownership. Clearly, then, as the various mills, belonging to a single owner will not compete with each other in the employment of labor, the mills belonging to a trust will be no more likely to do so. Thus if it were not for the fact that the workmen are able to take up some other employment if their wages are too low, they would be absolutely obliged to take what wages, great or small, the trust chose to give, and would be as dependent for their food and clothing upon the trust as was the slave upon his master. . . .

"The point to which we need to pay especial attention is the fact that the cost of production is continually being cheapened as it is carried on on a larger and larger scale. And because the cheaper mode of production must always displace the mode which is more expensive: as Professor Richard Ely expresses it, 'Production on the largest possible scale will be the only practical mode of production in the near future.' We need not stop to prove the statement that the cost of production by the modern factory system is a small fraction of that by the old workshop system. The fact that the former has beaten the latter in the race of competition would prove it, if it were not evident to the most careless observer. But it is also a fact that the trust, apart from its character as a monopoly, is actually a means of cheapening production over the system by independent factories, for it carries it on on a larger scale than it has ever before been conducted. Our review of the trust from the trust-makers' standpoint showed this most forcibly; and we shall see more of it as we study further the methods by which the monopoly gains an advantage over the independent producer in dispensing with what we may call the waste of competition. In the argument presented by the Standard Oil Trust before the House Committee on Manufactures in the summer of 1888, occurs the following statement of the work which that monopoly has done in cheapening production:

"The Standard Oil Trust offers to prove by various witnesses, including Messrs. Flagler and Rockefeller, that the disastrous condition of the refining business and the numerous failures of refiners prior to 1875 arose from imperfect methods of refining, want of cooperation among refiners, the prevalence of speculative methods in the purchase and sale of both crude and refined petroleum, sudden and great reductions in prices of crude, and excessive rates of freight; that these disasters led to cooperation and association among the refiners, and that such association and cooperation, resulting eventually in the Standard Oil Trust, has enabled the refiners so cooperating to reduce the price of petroleum products and thus benefit the public to a very marked degree, and that this has been accomplished:

"1. By cheapening transportation, both local and to the seaboard, through perfecting and extending the pipe-line system, by constructing and supplying cars with which oil can be shipped in bulk at less cost than in packages, and the cost of packages also be saved; by building tanks for the storage of oil in bulk; by purchasing and perfecting terminal facilities for receiving, handling, and reshipping oils; by purchasing or building steam tugs and lighters for seaboard or river service, and by building wharves, docks, and warehouses for home and foreign shipments.

"2. That by uniting the knowledge, experience, and skill, and by building manufactories on a more perfect and extensive scale, with approved machinery and appliances, they have been enabled to and do manufacture a better quality of illuminating oil at less cost, the actual cost of manufacturing having been thereby reduced about 66 per cent.

"3. That by the same methods, the cost of manufacture in barrels, tin cans, and wooden cases has been reduced from 50 to 60 per cent.

"4. That as a result of these savings in cost, the price of refined oils has been reduced since cooperation began, about nine cents per gallon, after making allowance for reduction in the price of crude oil, amounting to a saving to the public of about \$100,000,000 per annum."

"Certainly it would seem that this is a strong defense of the trust's character as a public benefactor; but it is well to note that while it has been making these expenditures and reducing the price of oil to the consumer, it has also been making some money for itself. The profits of this trust in 1887, according to the report of the committee appointed to investigate the subject of trusts by the New York Legislature, were \$20,000,000. The nominal capital of the trust is but \$90,000,000, a large portion of which is confessedly water. In answer to the statement that the price of oil has been reduced steadily by the operations of the

trust, it is charged that no thanks is due to the trust for this benefit. The trust has always wished to put up the price, but the continual increase in the production of the oil fields has obliged the trust to make low prices in order to dispose of its stock." (See STANDARD OIL COMPANY.)

To the above views must be added the views of those who hold that monopolies are due primarily to the great parent monopoly, the private ownership of land (the single-tax view), and the view that monopolies are due to the action of government (the view of the philosophical anarchists).

The single-tax men say that were natural opportunities taxed to their full rental value, private monopolies must disappear, because then the value of all natural opportunities, like building sites, mines, oil wells, railroad beds, streets, franchises, etc., would go to the community; other monopolies, they assert, could not be developed, because if all had access to land, even the weakest competitors could at least exist, and so prevent the stronger competitors from gaining a monopoly. Till the great parent monopoly of the land is destroyed, to fight lesser monopolies, say the single taxers, is hopeless.

Anarchists say that the source of all monopolies lies in a grant from Government, and that were this given up, monopolies could not continue a day save as they well served the public.

(But for all these views and for their answers, see ANARCHISM; COMPETITION; INDIVIDUALISM; NATIONALISM; NATURAL MONOPOLIES; SINGLE TAX; SOCIALISM.)

MONT DE PIÉTÉS (from It. *monte di pietà*, fund of pity) are institutions established by public authority for lending money at moderate rates on the security of goods. They originated in Italy in the fifteenth century to counteract the usurious practices of the Jewish money-lenders.

MONTESQUIEU, CHARLES LOUIS DE SECONDAT, BARON DE, was born near Bordeaux, France, in 1689. He was educated at the oratorian college of Juilly and the Academy of Bordeaux, but during his studies at Bordeaux he entered the Council of Bordeaux, and in 1716 became its president. Under the influence of Newton he interested himself in natural science. In 1721 he produced the *Lettres Persanes*, a satire by a supposed Persian traveler in France on French society. In 1725 came the *Temple de Gnide*, an allegorical prose poem. He was now elected to the Academy, but did not take his seat till 1728. He traveled in Germany and Italy, and spent two years in England studying social institutions, and wrote several minor political works preparatory to his masterpiece, *L'Esprit des Loix* (1748). Its character is indicated by its full title: "On the Spirit of Laws; or, the Necessary Relations between a Country's Laws and the Nature of its Government, its Manners, Climate, Religion, Commerce," etc. It was received with great enthusiasm, and ran through 22 editions in a year and a half. To the objections it

called forth Montesquieu replied in his *Défense de l'Esprit des Lois* (1750). After writing other minor works, Montesquieu died in 1755. (For his main teachings, see POLITICAL SCIENCE.)

MORAL ELEMENT IN SOCIAL REFORM, THE.—Perhaps no characteristic of the present efforts for social reform are more hopeful and more important than the deepening emphasis now placed—however far we may yet be from placing all the emphasis we ought—on the moral element in social reform. A hundred years ago the key-word in social reform was “natural rights,” and in economics “*laissez faire*.” To-day the key-word in reform is “cooperation,” and in economics “character.” If this may seem to some too optimistic a view, we remind them that individualist, socialist, and even anarchist reformers all seek cooperation, while in economics the reason why individualist economists fear socialism is that they believe that it will deteriorate character, and the reason why socialist economists seek socialism is their belief that under individualism character is deteriorating. Undoubtedly there are also evil signs to-day. Many socialist reformers come perilously near to an unethical materialism, and many individualist economists approach a cynical belief that the only thing which can be counted on to dominate activity is a material self-interest. Doubtless, too, it is possible to minimize the moral element which existed 100 years ago. If the doctrine of “natural rights” (*q.v.*) produced the French and perhaps the American Revolution, it was often striven for with a devotion and sacrifice of the most ethical kind. Of the economics of Adam Smith, Arnold Toynbee, who criticises them, says (*Industrial Revolution*):

“Two conceptions are woven into every argument of the *Wealth of Nations*, the belief in the supremacy of individual liberty and the conviction that man's self-love is God's providence, so that the individual, in pursuit of his own interest, is promoting the interest of all.”

Nevertheless, neither ignoring our own deficiencies nor minimizing the moral element of the past, it must be recognized that economics have been considerably moralized within the century, particularly in England, and that the present widespread effort for social reform upon all lines indicates in itself a deepening and a widening of the moral impulse. Under the old political economy, especially with the successors of Adam Smith rather than with Adam Smith himself, men, as Bagehot (*q.v.*) shows, were conceived as simply “economic men,” “money-making animals.” To-day political economy, particularly of the psychologic school and to a less extent of the historical school, considers man in his full, round nature. Again, the aim of the old political economy was the wealth of nations considered mainly from the standpoint of material production.

To-day political economy gives at least a considerably increased attention to the problems of distribution, and to the good of the working classes. It has become far less of a pure science and much more of a practical art. This change is largely due to Mill, or, at least, be-

comes first prominent in his work. In the introduction to his *Political Economy* (1848), he says:

“The design of the book is different from that of any treatise on political economy which has been produced in England since the work of Adam Smith.

“The most characteristic quality of that work, and the one in which it most differs from some others which have equaled and even surpassed it as mere expositions of the general principles of the subject, is that it invariably associates the principles with their applications. This of itself implies a much wider range of ideas and of topics than are included in political economy, considered as a branch of abstract speculation. For practical purposes, political economy is inseparably intertwined with many other branches of social philosophy. Except in matters of mere detail, there are perhaps no practical questions, even among those which approach nearest to the character of purely economical questions, which admit of being decided on economical premises alone. And it is because Adam Smith never loses sight of this truth; because, in his applications of political economy, he perpetually appeals to other and often far larger considerations than pure political economy affords, that he gives the well-grounded feeling of command over the principles of the subject for purposes of practice, owing to which the *Wealth of Nations*, alone among treatises on political economy, has not only been popular with general readers, but has impressed itself strongly on the minds of men of the world and of legislators.

“It appears to the present writer that a work similar in its object and general conception to that of Adam Smith, but adapted to the more extended knowledge and improved ideas of the present age, is the kind of contribution which political economy at present requires.”

Since Mill, political economy has steadily grown “moral.” Professor Ely divides the evolution of political economy into three periods. He says (*Introduction to Political Economy*, pp. 105, 106):

“Economic goods are first made the primary thing, and they are treated almost as if their production was an independent process apart from the will of man, one extreme writer going so far as to say that the laws governing the production of wealth would be just what they are if man did not exist. The social relations involved in the production and consumption of economic goods are then considered more carefully, and finally the original process is reversed, and it is distinctly asserted that ‘the starting-point as well as the object-point of our science is man’ (Roscher's *Political Economy*, vol. i. of Lalor's translation, p. 52).

“The definition of political economy found in Mrs. Fawcett's little *Political Economy* may be taken as a fair presentation of the first class of conceptions. It is as follows: ‘Political economy is the science which investigates the nature of wealth and the laws which govern its production, exchange, and distribution.’

“The definition of political economy found in John Stuart Mill's treatise may be taken as a tolerably accurate presentation of the second class of conceptions. ‘Writers on political economy,’ says Mill, ‘profess to teach or investigate the nature of wealth and the laws of its production and distribution, including directly or remotely the operation of all the causes by which the condition of mankind or of any society of human beings in respect to this universal object of human desire is made prosperous or the reverse.’ Social relations are dragged in through a back door, as it were.” As an illustration of the third period, Professor Ely quotes Professor Henry C. Adams, of the University of Michigan, as saying of political economy, in his *Outlines of Lectures upon Political Economy*, that it “treats of industrial society. Its purpose as an analytic science is to explain the industrial actions of men. Its purpose as a constructive science is to discover a scientific and rational basis for the formation and government of industrial society.”

The present moral danger of modern political economy is over analysis. Says Dr. Edward Caird (*The Moral Aspect of the Economical Problem*, a presidential address to the Ethical Society):

"It is the peculiar temptation of students of science and literature to cultivate a so-called critical spirit—a consciousness of scientific law, that has no tolerance for any form of zeal which is not quite according to knowledge or a literary sense, the delicacy and quickness of which is easily turned into faultfinding and intolerance of every thought and feeling which does not express itself in conformity with its own standards. The devil of these modern days is not, as Goethe said, the northern phantom with horns and hoofs, not the spirit which inspires a rabid witchlike frenzy for evil, that mocks the sacred enthusiasm for good; it is the spirit which always denies, which sees nothing but pretense in virtue, nothing but illusion in the higher hopes and faiths of man. This chilling doubt is the shadow that accompanies our advancing knowledge, sometimes taking away the good of it, and making us almost wish for the simpler faiths and unhesitating instincts of an earlier time. . . . It is this that turns science aside into the way of a false realistic analysis, which 'has the parts in its hand, but has lost all consciousness of the spiritual bond which united them.' It is this which reduces life to its crude elements, and then doubts whether it is worth living; it is this finally that so fills us with the sense of the difficulties and disadvantages of every step to improve the condition of man, that we shrink into isolation and inaction. . . .

"This is the devil which is most dangerous to the soul that has been swept and garnished by culture, and which that soul must repel if it would save itself from growing weakness and moral decay. As a class, men of culture are not much in danger of being possessed by a frantic love of evil and hatred of good, but sometimes they are in danger of losing a belief in the greatness of the issues of existence which are hid under its littleness, and in the worth of every human life, in spite of the triviality and meanness of its appearance."

But more than to any advance in academic political economy is the present indebted to the great moral reformers, like Carlyle, Ruskin, Maurice, Mazzini, and Tolstoi. For their position and contributions to

Reformers. social reform, see their respective names; but it is to Ruskin, more than to any other modern reformer, we owe the conceptions that wealth is well living; that the life is more than meat; that man should own property and not property own man. It is to Carlyle that we owe an exaltation of the possibility of man, and the assertion of manhood over social and economic shams. It is to Maurice that the Church of to-day mainly owes her Christian Socialism. It is Mazzini who, more strongly than any, has emphasized duty as greater than rights, and God as above materialism. Tolstoi, more than any other, has taught individualists the greatness of sacrifice. (For a consideration, however, of the moral element in social reform, so far as it has taken the form of Christian thought and effort, see CHRISTIAN SOCIALISM; CHURCH AND SOCIAL REFORM.) Outside of the Church the deepest contribution to the moralization of reform, except from individuals like the above, has come from the positivist school and from the modern ethical movement.

Said Frederic Harrison (*q.v.*) (*Address on Moral and Religious Socialism*, January 1, 1891), the central social maxim of positivism is "to make political interests give way to moral duties." Its aim is a religion of humanity, the service of man. As for the various societies of ethical culture in America and Europe, their avowed object is "the elevation of the moral life of its members and that of the community," and everywhere its societies are calling attention to the moral side of social reforms.

It must be remembered that our subject is the moral element in social reform. It is questioned

by some if society is growing moral. (See CRIME.) Says J. M. Whiton (*The Reaction of Ethics upon Economics*, address at Yale College, June, 1888):

"We are now threatened with moral chaos in the world of trade, as the natural result of that Lucretian vortex of atoms, out of which Smith and his disciples imagined an economic cosmos would come. So dispassionate an observer as Professor H. Sidgwick, of Cambridge, criticises 'the anti-social temper and attitude of mind produced by the continual struggle of competition,' and inquires 'whether the whole individualistic organization of industry, whatever its material advantages be, is not open to condemnation as radically demoralizing.' The question is answered by Professor Graham, of Belfast: 'Our practical working ethics, as distinct from the ethics of the schools, often grand enough, is narrowed to the lowest egoism and the coarsest moral materialism.' . . .

"These old questions, newly moved by authorities whom it is folly to disparage, we see seconded on every hand by spectacles which stir the common mind to thinking on the problems thus proposed; as by heightening contrasts between the neighbors Opulence and Indigence, by the purchase of ground for a ten-million-dollar cathedral in honor of Christ, while the slums, where Christ's little ones die in noisome heat by thousands, remain undisturbed, and even lucrative at 35 per cent. . . .

"Our political seers, also, have heard the surf through the fog, and are crying from their look-out, 'Breakers ahead.' 'Nowhere in the world,' says our Professor Sumner, 'is the danger of a plutocracy as formidable as it is here. . . . Already the question presents itself as one of life or death to democracy. . . . The task before us is one which calls for fresh reserves of moral force and political virtue from the very foundations of the social body.'"

Nevertheless, the very recognition of these evils and the effort to meet them indicate an advance. Even our wealthy men, who sneer at social reform, are compelled, as never before, to practise a "gospel of wealth;" and it is among the best signs of the times that never, as now, was philanthropy so criticised for giving to the poor only what it has first taken from the poor, bestowing on universities and charities that which it gathered by avarice and perhaps by fraud.

We are developing, as Mr. H. D. Lloyd (*q.v.*) has asserted, "a new conscience." Long ago Mazzini wrote: "Every political question is becoming a social question, and every social question is rapidly becoming a religious question." Matthew Arnold defines civilization as "the humanizing, the bringing into one harmonious and truly humane life of the whole body of society." If this is not true of civilization to-day, it is at least the present aim and endeavor of social reform.

Caird (1885); *Prolegomena to Ethics*, by T. H. Green (1890); *An Introduction to Social Philosophy*, by J. S. Mackenzie; *History of Ethics*, by H. Sidgwick (1892); *Principles of Ethics*, by H. Spencer. (See also CHRISTIANITY AND SOCIAL REFORM.)

MORALITY AND SOCIALISM.—Many writers believe that socialism would subvert morality. In Mr. Lecky's *Democracy and Liberty* he argues that the sense of right and wrong is the basis of the respect for property and for the obligation of contract, and that it is being subverted by socialists. He quotes (vol. i., p. 310) the *Sozial Demokrat*, the organ of the German socialists, as saying:

"The socialistic State will never be realized except

by a violent revolution, and it is our duty to spread this conviction through all classes. . . . Christianity is the greatest enemy of socialism. . . . When God is expelled from human brains, what is called the Divine Grace will at the same time be banished; and when the heaven above appears nothing more than an immense falsehood, men will seek to create for themselves a heaven below." Marx himself once wrote: "Force is the midwife of every old society pregnant with a new one." Gabriel Deville, a French socialist, is quoted as saying in his introduction to a translation of Marx's *Capital*, that socialists when in power must "proceed by law to the economical expropriation of those whom they will have already dethroned by force. . . . It is only necessary to destroy the title-deeds, shares or obligations, treating those dirty documents as waste paper." In England the Fabian Society is committed in its declared principles to the transfer to the community of land and industrial capital "without compensation (tho not without such relief to expropriated individuals as may seem fit to the community)." The Social Democrat Federation has as a plank in its platform "the repudiation of the national debt." In the United States Mr. George (*Social Problems*, pp. 213-221) argues it as "a preposterous assumption that one generation should be bound by the debts of its predecessors."

Again, radical reformers are accused of violating family morality. In Germany, Bebel, in his *Woman*, freely argues for the baldest "free love." Deville (see above) says:

"Marriage is a regulation of property. . . . When property is transformed, and only after that transformation, marriage will lose its reason for existence, and boys and girls may then freely and without fear of censure listen to the wants and promptings of their nature. . . . The support of the children will no longer depend on the chance of birth. Like their instruction, it will become a charge of society. There will be no room for prostitution or for marriage, which is in sum nothing more than prostitution before the mayor." In England Mr. Hyndman writes (*Historical Basis of Socialism*, p. 452): "In the German Christian sense of marriage for life, and responsibility of the parents for the children born in wedlock, is almost at an end even now," and must result in "a widely extended communism." Mr. Morris and Mr. Bax, in their *Socialism, in its Growth and Outcome*, contend that "marriage should be a voluntary association, dissoluble by either party at pleasure."

It is true, as Mr. Lecky points out, that by no means all socialist and radical reformers hold these views, but such utterances from socialist leaders, he says, will help the reader understand "why it is that German statesmen regard the socialists not as a normal political party, but as the deadly enemies of their country and of civilized society."

The opposite side to this view is, in the first place, to recognize that, as Prof. Schäffle, the best non-socialist authority on socialism, has pointed out in his *Quintessence of Socialism*, socialism as a movement is by no means committed to either confiscation or free love. Many socialists believe in these, but so do many not socialists.

As to radical views of marriage, not to speak of continental writers, witness the tendency in the novels of Mallock, Grant Allen, and even Hardy in the United States. No one school of thought is to be condemned for having among its members those who hold such views.

"As to confiscation through taxation," Professor Hadley says (*Economics*, p. 472), "most would be willing to agree that more taxes should be assessed upon economic rent and less upon improvements."

Secondly, socialists say it is the present which develops immorality. If socialists would through legal forms confiscate the property of the wealthy to establish justice, the present confiscates the property of the poor to establish injustice.

Which is the worse? At present the poor work for the rich through compulsion. Their agreements to receive low wages are forced agreements. "They are like the bargain that a naked and shivering swimmer might be induced to make with a larger man in possession of the swimmer's clothes." It is this subversion of the moral sense, in seeing those who work the hardest get the least, and many who do not work at all living in luxury, not a few prospering by downright gambling or industrial robbery, that, socialists say, is the danger to-day. If socialism would confiscate through taxation large properties, it would at least give all an equal share in proportion to work done. If it would use force, it would only use force when the possessed classes, having been defeated at the polls, try by force to prevent a victorious socialist party from enacting its will. Almost all socialists believe that more or less force will be necessary in such instance, but only because they believe that the wealthy will first draw the sword. As for free love, to-day divorce is on the increase and prostitution frightfully common. Socialism would end prostitution, the sale of the body for money, and allow all who will to live in permanent monogamy. It would simply not force continuance in unwilling marriage. Such are the two views. (See PROSTITUTION; DIVORCE; FAMILY, section on Free Love.)

MORAVIANS.—The Moravian Church, or Church of the United Brethren, the *Unitas Fratrum*, originated in the reformation of John Huss in Bohemia and Moravia in the fifteenth century. Almost crushed out by persecution, it was revived in 1722 at Herrnhut by Count Zinzendorf, and the policy was adopted of propagating its faith by forming missionary semi-communal colonies, which by a quiet fraternal life, joined to a pietistic faith, should influence the world. Since 1732 more than 2200 missionaries have gone out. These communities celebrated love feasts (*agape, q.v.*), and in every way developed the fraternal spirit. Since 1856 these fraternal customs have, however, disappeared from Moravian settlements in the United States, where the Moravians numbered 19,497 in 1890—about half those in the world.

MORE, SIR THOMAS, was born in London in 1478, the son of a judge of the court of King's Bench. He became at the age of 15 a page in the household of Cardinal Morton, Archbishop of Canterbury, and Prime Minister. In 1497 he entered Oxford University, and afterward studied law at Lincoln's Inn, London, and resided for some years at a Gray Friars monastery. In 1502 he became a judge in the sheriff's court. He also became Member of Parliament for Middlesex. Sir James Mackintosh says of him that "he is the first person in our [English] history distinguished by the faculty of public speaking, and is remarkable for the successful employment of it in Parliament against a lavish grant of money to the Crown." The occasion referred to was when he persuaded the House of Commons not to grant a supply to Henry VII. on the marriage of his daugh-

ter. About 1514 he wrote his famous *Utopia*, which was printed in Louvain (1516) under the editorship of his friend Erasmus, and was soon translated into many languages. In 1521 More was knighted and appointed treasurer of the exchequer, and in 1523, speaker of the House of Commons. In 1529 he was appointed lord-chancellor in place of Cardinal Wolsey. Tho opposed to Luther, who had attacked Erasmus as well as Henry VIII., he nevertheless in 1532 resigned the great seal because his conscience refused to sanction the divorce of Queen Catherine and the second marriage of the king. Having declined to take the oath by which he was required to recognize the validity of the marriage of Anne Boleyn, he was consigned to the Tower of London in 1534. After he had been in prison for a year he was charged with treason in that he denied the king's supremacy as head of the Church, and finally was condemned and beheaded on July 6, 1535. All the accounts we have of Sir Thomas More's life agree in describing him as of unusual greatness, pure-minded, just and generous, with an inexhaustible flow of sprightly wit; and tho as a statesman bound by his surroundings, yet able to see clearly the evils of despotism and monarchy, and in heart, as is shown in his *Utopia*, a democratic republican. In this book More first introduces his readers to a traveler and philosopher whom he meets in Antwerp, just returned from journeyings in strange lands; he had started out with Vespucci on his last voyage, but leaving him at the farthest point had pushed on to other strange lands, and finally to the island of Utopia, whose laws and customs impressed him greatly, and which he relates at length to More. The descriptions show a very keen perception of the causes of misgovernment, while the sentiments put into the mouth of the traveler when he is discussing English institutions show that Sir Thomas More was at heart, at all events, a pronounced republican, and one who loved his fellow-men rather than institutions. In Utopia all save the old and infirm are expected to labor six hours a day; all goods of every kind are owned in common; and the people chose their houses every ten years by lot, and dine together in large halls. They have no money of any kind, and consider gold and silver as the basest of metals, fit only for ignoble uses. All personal adornment they consider as childish and degrading. Their priests are few in number, but are universally revered for their sanctity and their courage in time of war. There are two religious orders among them, very similar to the Order of St. Francis of Assisi; their endeavor is to purify their souls by engaging in the lowliest and most unattractive labors. Religious intolerance is a thing unknown, as it is the doctrine of the Utopians that belief is largely a matter of environment and birth. There are 24 cities in Utopia, equal in extent. The government is largely directed by a council composed of three wise men from each city, who are elected by their fellow-citizens. The criminals of the cities are enslaved, and obliged to perform the more laborious and disagreeable work.

MORELLI was a French writer of the

eighteenth century, of whose life Larousse's *Dictionnaire* says that absolutely nothing is known, tho according to some accounts he was an abbé and lived at Vitrey-le-François. Several of his writings, however, are known and are important, especially his *Essai sur l'esprit humain* (1745); *le Prince, les delices du cœur ou Traité des qualités d'un grand roi et système d'un sage gouvernement* (2 vols., 1751); *Naufrage des îles flottantes à la Basiliade*, a social Utopia; above all, his *Code de la nature ou le véritable esprit de ses lois de tout temps négligé ou méconnue* (1755), a book influential in forming the social theories of the French Revolution, and said to be the inspirer of Babœuf (*q.v.*).

MORMONISM.—The Mormon Church we consider here simply in its relation to economic and social problems. Born in 1831 at Fayette, N. Y., of the preaching of Joseph Smith, Jr., based on the revelation he claimed to have received on golden plates written, long hidden, and finally revealed to Smith by a prophet Mormon who is stated to have lived in America some time after Christ Himself, in some mysterious way, had preached Christianity in America. Mormonism claims to be a Christian religion, believing in Christ, in the Trinity, and in the Bible. With *The Book of Mormon* Smith's preaching gained many followers, and in 1831 a prosperous Mormon settlement was made at Kirkland, O., and a temple built. Persecuted, however, here, Smith led his followers in 1837 to Far West, Mo., and driven from there to Nauvoo, Ill., where their numbers reached 12,000, and they were prosperous in every way. A discontented member, however, made trouble, denounced and attacked Smith. Serious dissension arose; the civil authorities were called upon, and Smith was shot by a mob from the outlying region in 1844. Brigham Young, who had joined the sect in 1832, now became leader, and led the community to Council Bluffs in 1845, and in 1847, after an amazing march across the prairies and over the mountains, founded in territory then far beyond the limits of the United States what is now Salt Lake City, in Utah. When the United States acquired this territory, the Mormons desired to form a new State called Deseret, or the Land of the Honey Bee, but Congress would not allow this, and in 1850 the Territory of Utah was formed, Brigham Young being the first governor. In 1852 the practice of polygamy was first openly proclaimed, and even enjoined upon Mormons as a means of grace, tho it is said to have been promulgated within the church in 1843, and is said by some to have been practised by the leaders from the beginning of the church. This step created opposition through the country, and as early as 1862 Congress took some steps to stamp it out. Little, however, was accomplished. The Mormon priesthood had all the power in the territory, and little could be done. In 1882 stronger efforts were made. The Edmunds law made bigamy and polygamy in all United States territories punishable with a fine of not over \$500 and imprisonment up to five years. Any one cohabiting with more than one woman could be imprisoned six months or fined \$300, or both.

Any juryman who believed in polygamy could be challenged. All elections were conducted by a special federal commission, and polygamists were disenfranchised; 12,000 men and women—for women had been given the franchise by the Mormon authorities in 1870, and had strongly supported the church—were thus disenfranchised. Later, in 1887, all women were disenfranchised. Adultery and fornication were made criminal offenses. Witnesses were compelled to testify. Marriages must be fully registered, and all illegitimate were denied right of inheritance. Special oaths were required from voters declaring that they were not polygamists. By such severe measures polygamy was broken up, and in 1890 Gentiles for the first time obtained control of the municipal government; 1100 persons were said to have been convicted of polygamy, and over \$50,000 of church property was confiscated. Finally in 1890 President Wilford Woodruff issued a pronouncement against polygamy. Brigham Young had died in 1877, and had been followed by John Taylor, and then Woodruff. Since then the division between Mormons and Gentiles has largely died away. Intermarriages take place. Social and business intercourse is continual. In 1894 President Cleveland granted amnesty and civil rights to all convicted of polygamy. In 1896 Utah was admitted as a State. The church authorities, however, are still accused of demanding obedience to them in political as well as religious affairs. There were in 1890, 50,000 Gentiles in Utah and 110,000 Mormons. There are perhaps as many more Mormons in Idaho, Arizona, Montana, Wyoming, New Mexico, Colorado, and Washington.

The industrial and economic development of the Mormons, or the Church of Jesus Christ or Latter Day Saints, as they are called, is more attractive. The system seems to have been purely paternal and even tyrannical, but under the rule of the heads of the church industry was encouraged, all were given land, none were allowed to go in want, some fine buildings were erected. Even in the polygamous period only 10 per cent. of the people were said to have practised polygamy. Prominent wives and children of plural marriages declared their homes happy. Prostitution was unknown. Favoritism between wives was forbidden. On the other hand, pathetic stories were told of the suffering of the women, and dark massacres, like those of Mountain Meadows in 1857, and other deeds of cruelty, seem to have been traced to the doors of the leading authorities of the church.

MORRIS, WILLIAM, was born at Walthamstow, near London, in 1834. He was educated first at the school of that place, at Marlborough, and at Exeter College, Oxford. In 1856 he was articled to Mr. Street, the architect. He also studied painting, but in 1863 devoted himself mainly to the design and manufacture of artistic household furniture, wall paper, stained glass, and other decorations. He also later on started an ideal factory near Merton Abbey, and founded the "Kelmscott Press," for printing according to the canons of the truest art. In literature he early commenced contributing to the papers, mainly the *Oxford and*

Cambridge Magazine. In 1858 he published *The Defense of Guenevère and other Poems*; in 1867, *The Life and Death of Jason*, a heroic poem in 17 books. From 1868-70 *The Earthly Paradise* came out in installments. In 1876 appeared his Virgil's *Æneid*, "done into English verse;" and in 1877 *The Story of Sigurd, the Volsung, and the Fall of the Niblungs*, by many considered his masterpiece. Up to this time he had been, as he called himself, "the idle singer of an empty day." His experience in the commercialism and consequent degradation of modern art now drove him to socialism. In 1885 he was instrumental in forming the Socialist League, and since that time he worked strenuously for socialism, editing and writing for *The Commonweal*, attending meetings and addressing open-air audiences of working men. He published numerous socialist lectures, tracts and chants, such as *Art and Socialism* (1884); *Signs of Change* (1888); *Useful Work versus Useless Toil*, etc. His later poems are Homer's *Odyssey*, done into English verse (1887); *A Tale of the House of Wolfings* (1889); *The Wood Beyond the World* (1895). The above, however, are only a portion of his works. In 1888 he republished from *The Commonweal*, *A Dream of John Ball*, a most beautiful socialist prose poem; in 1892 *News from Nowhere*, a socialistic and artistic Utopia; and in 1894, in conjunction with Belfort Bax, *Socialism, its Growth and Outcome*. Altho he retired from the editorship of *The Commonweal*, which has passed into anarchist hands, Mr. Morris worked most fruitfully as "poet, artist, and socialist," until his death, which occurred October 3, 1896.

MORTGAGES.—We consider this subject under two heads: first, the statistics of mortgages; second, their significance.

I. STATISTICS.

Extra Bulletin No. 98 of the United States Census, 1890, says:

"There are 12,690,152 families in the United States, and of these families 52.20 per cent. hire their farms or homes and 47.80 per cent. own them, while 27.07 per cent. of the owning families own subject to encumbrance and 72.03 per cent. own free of encumbrance. Among 100 families, on the average, 52 hire their farms or homes, 13 own with encumbrance, and 35 without encumbrance. On the owned farms and homes there are liens amounting to \$2,132,949,563, which is 37.50 per cent. of the value of the encumbered farms and homes, and this debt bears interest at the average rate of 6.65 per cent. Each owned and encumbered farm or home, on the average, is worth \$3352, and is subject to a debt of \$1257.

"In regard to the families occupying farms, the conclusion is, that 34.08 per cent. of the families hire and 65.92 per cent. own the farms cultivated by them; that 28.22 per cent. of the owning families own subject to encumbrance and 71.78 per cent. own free of encumbrance. Among 100 farm families, on the average, 34 hire their farms, 19 own with encumbrance, and 47 without encumbrance. On the owned farms there are liens amounting to \$1,085,995,960, which is 35.55 per cent. of the value of the encumbered farms, and this debt bears interest at the average rate of 7.07 per cent. Each owned and encumbered farm, on the average, is worth \$3444, and is subject to a debt of \$1224.

"The corresponding facts for the families occupying homes are, that 63.10 per cent. hire and 36.90 per cent. own their homes; that of the home-owning families, 72.30 per cent. own free of encumbrance and 27.70 per cent. with encumbrance. In 100 home families, on the average, 63 hire their homes, 10 own with encumbrance, and 27 without encumbrance. The debt

on owned homes aggregates \$1,046,953,603, or 39.77 per cent. of the value of the encumbered homes, and bears interest at the average rate of 6.23 per cent. An average debt of \$1293 encumbers each home, which has an average value of \$3250.

Ownership of Homes and Farms.

There are 420 cities and towns that have a population of 8000 to 100,000, and in these cities and towns 64.04 per cent. of the home families hire and 35.96 per cent. own their homes, and of the home-owning families 34.11 per cent. own with encumbrance and 65.89 per cent. own free of encumbrance. In 100 home families, on the average, are found 64 that hire their homes, 12 that own with encumbrance, and 24 that own without encumbrance. The liens on the owned homes are 39.55 per cent. of the value of those subject to lien. Several averages show that the rate of interest is 6.29 per cent.; value of each owned and encumbered home, \$3447; lien on the same, \$1363.

"The cities that have a population of 100,000 and over number 23, and in these cities 77.17 per cent. of the home families hire and 22.83 per cent. own their homes; 37.80 per cent. of the home-owning families have encumbrance on their homes, and 62.20 per cent. own and occupy homes free of encumbrance. Among 100 home families, on the average, 77 hire, 9 own with encumbrance, and 14 without encumbrance. Averages for each owned and encumbered home: Encumbrance, \$2337; value, \$5555; rate of interest, 5.75 per cent. Homes are encumbered for 42.07 per cent. of their value; . . . 60.05 per cent. of the families occupying owned and encumbered farms and homes have encumbrances of less than \$1000, and the amount of the encumbrance is 20.70 per cent. of the total amount on all owned and encumbered farms and homes; and in the case of encumbrances amounting to \$5000 and over, the families are represented by 3.60 per cent. of the total, and the amount of encumbrance by 24.49 per cent."

Extra Census Bulletin No. 71 gives the statistics of mortgages by amounts, length of mortgage, rate of interest for the United States from 1880-89. It says:

"During that time 9,517,747 real estate mortgages stating amount of debt incurred were made in the United States, representing an incurred indebtedness of \$12,094,877,793. The number of mortgages made during one year increased from 643,143 in 1880 to 1,226,323 in 1889, or 90.63 per cent., and the yearly incurred indebtedness increased from \$710,888,504 in 1880 to \$1,752,563,274 in 1889, or 146.53 per cent.

"With regard to mortgages on acre tracts, the number made during the 10 years was 4,747,078, representing an incurred indebtedness of \$4,806,777,112. The number of these mortgages made in 1880 was 370,984; in 1889, 525,094, an increase of 41.54 per cent.; while the incurred indebtedness increased from \$342,566,477 in 1880 to \$85,729,719 in 1889, an increase of 70.93 per cent.

"The increase was relatively larger in the case of mortgages on lots. They numbered 4,770,669 during the 10 years, and the indebtedness incurred under them amounted to \$7,158,106,681. From 1880 to 1889 the annual number made increased from 272,159 to 701,229, an increase of 157.65 per cent. During the same time the amount of annual indebtedness incurred increased from \$593,322,027 to \$1,166,838,555, an increase of 216.80 per cent.

"During the decade 622,855,091 acres were covered by 4,758,268 mortgages stating and not stating the amount of indebtedness incurred under them; the number of acres covered by mortgage in 1880 was 42,743,013; in 1889, 70,678,257, an increase of 65.36 per cent.

Amounts.

In the case of lots covered by mortgage the increase from 1880 to 1889 was 108.25 per cent., the number covered by mortgages stating and not stating amount of indebtedness in the former year being 429,955; in the latter year, 1,282,334.

"At the end of the decade, January 1, 1890, the real estate mortgage indebtedness amounted to \$6,019,679,985, represented by 4,777,698 mortgages. These mortgages are divided into two classes, as follows: mortgages on acres, 2,303,061; amount of indebtedness, \$2,209,148,431; mortgages on lots, 2,474,637; amount of indebtedness, \$3,810,531,554. Number of acres covered by existing mortgages, 273,352,109; number of lots, 4,161,138.

"New York is conspicuously prominent as having a real estate mortgage indebtedness of \$1,607,874,301, which is 26.71 per cent. of this class of indebtedness in the United States. Nevada has the smallest amount of indebtedness of this sort—viz., \$2,194,995.

"It is computed that the average life of a mortgage in the United States is 4.660 years;* of a mortgage on acres, 4.540 years; of a mortgage on lots, 4.740 years. The longer life in the case of both classes of mortgages is found in New England, New York and New Jersey; the shorter life in the South and in the newly settled regions west of the Mississippi River.

"Since mortgages in force were made, 12.68 per cent. of the original amount of indebtedness incurred under them has been extinguished by partial payments; in the case of mortgages on acres, 11.67 per cent.; on lots, 13.25 per cent. The percentage of partial payments is highest in the South and lowest in the more newly settled regions.

"Subject to all the difficulties that beset any attempt to determine what proportion of the true taxed real estate value of the United States is covered by existing real estate mortgage indebtedness, it appears that the real estate mortgage indebtedness in force in the United States is 16.67 per cent. of the true value of all taxed real estate and untaxed mines. If Mayor Gilroy's estimate of \$3,495,725,018 as the true value of real estate in New York City is accepted, the foregoing percentage is reduced to 16.15, and the percentage for New York State is reduced from 30.62 to 25.06.

"In 30 States the debt on acres is 12.67 per cent. of the true value of all taxed acres and untaxed mines, and in these States the mortgage debt on lots is 13.06 per cent. of the true value of all taxed lots, mortgaged and not mortgaged.

"Upon the assumption that all taxed real estate can be encumbered for two thirds of its true value without

* It is stated elsewhere that by the average life of a mortgage the census means the average age of the mortgages it found existent in 1890. Mortgages consequently live as much longer as they ran after 1890 without being paid off.—ED.

increasing the rate of interest to cover additional risk, it follows that 25.00 per cent. of the real estate mortgage debt limit has been reached in the United States. A computation, including Mayor Gilroy's estimate above mentioned, reduces the foregoing percentage to 24.22, and the percentage for New York State from 45.93 to 37.59. In Kansas, 40.24 per cent. of the debt limit has been reached; in New Jersey, 39.27 per cent. The smaller percentages are found in the South and in the Rocky Mountain region.

"The mortgage debt in force per capita in the United States is \$06; the three largest State averages (omitting the District of Columbia) are \$268 in New York, \$206 in Colorado, and \$200 in California. The smaller ones are found in the South and the Rocky Mountain region.

"In 41 States 28.86 per cent. of the taxed acres are covered by mortgages in force. The largest proportion of mortgaged acres is in Kansas, where 60.32 per cent. of the total number of taxed acres are mortgaged. Nebraska stands next with 54.73 per cent.; South Dakota third with 51.76 per cent.

"In the five States, Illinois, Kansas, Missouri, Nebraska, and South Carolina, 23.99 per cent. of the taxed lots are covered by mortgages in force.

"The average amount of debt in force against acres to each mortgaged acre in the United States is \$8.08; of debt in force against lots to each mortgaged lot, \$36; there are 119 acres covered by each mortgage in force against acres, and 1.68 lots by each mortgage in force against lots.

"The average rate for all mortgages in the United States is 6.60 per cent.; for mortgages on acres, 7.36 per cent.; for mortgages on lots, 6.16 per cent. These rates make the annual interest charge on the existing real estate mortgage debt of the United States amount to \$397,442,792; on the debt in force against acres, \$162,652,944; on lots, \$234,789,848.

"On each mortgage in force in the United States the average annual interest charge is \$83; on each mortgage in force against acres, \$71; on each mortgage in force against lots, \$95.

"6.03 per cent. of the number of mortgages were for amounts of less than \$100 each; while 42.57 per cent. of the entire number were for amounts of less than \$500, 68.54 per cent. of the entire number for amounts of less than \$1000, 27.41 per cent. of the entire number for amounts of \$1000 and under \$5000 each, and 4.05 per cent. of the entire number were for amounts of \$5000 and over.

"41.89 per cent. of the real estate mortgage indebtedness incurred in the United States during the decade was subject to a 6 per cent. rate of interest; 16.06 per cent. of the debt incurred was subject to rates less than 6 per cent.; 42.05 per cent. of the debt incurred was subject to rates greater than 6 per cent.; and 14.41 per cent. of the debt incurred was subject to rates greater than 8 per cent. The average rate of interest on real-estate mortgages declined from 7.14 per cent. in 1880 to 6.75 per cent. in 1889, with some interruptions to the continuity of the decline in the mean time.

"The average rate of interest on mortgages on acres declined from 7.62 per cent. in 1880 to 7.52 per cent. in 1889, subject to interruptions. The average rate of interest on the mortgages on lots declined from 6.60 per cent. in 1880 to 6.37 per cent. in 1889, with some annual interruptions. By personal inquiry in 102 counties in various parts of the Union, it was discovered that 80.13 per cent. of the number of mortgages, representing 82.56 per cent. of the original amount of mortgages in force, were made to secure purchase money and to make improvements when not combined with other objects, and that 89.82 per cent. of the number of mortgages, representing 94.37 per cent. of the original amount of existing indebtedness, were made to secure purchase money, to make improvements, to invest in business, and to buy the more durable kinds of personal property, when these objects were not combined with other objects.

"The percentages representing encumbrance for the various rates of interest show that the larger encumbrances bear the lower rates of interest, as a general fact. The amount of encumbrance bearing interest at less than 6 per cent. is 22.20 per cent. of the total encumbrance; the amount at 6 per cent. is 34.44 per cent.; the amount at 8 per cent. is 14.50 per cent.; the amount at 6 to 8 per cent., inclusive, is 66.82 per cent.; the amount at rates greater than 6 per cent. is 43.36 per cent.; the amount bearing rates greater than 8 per cent. is 10.98 per cent.; the amount bearing rates greater than 10 per cent., 1.33 per cent.; the amount bearing rates greater than 12 per cent., 0.27 of 1 per cent."

II. SIGNIFICANCE OF MORTGAGES.

There are two views of the significance of mortgages, both of which must be understood. The view that America is becoming a nation of tenants is well known. Says Mr. J. P. Dunn, Jr., writing in the *Political Science Quarterly* for March, 1890, after describing the situation:

"The mortgage indebtedness of the Western States is a matter worthy the attention of economists and statesmen, as well as of the people of those States. Whatever may be thought of its effects, it is a fact—mountainous and immovable. And more, the probabilities that loom far above the figures here presented make it very questionable whether the 'alarmists' who have discussed the subject have in fact materially exaggerated the existing conditions. . . .

"If the people of any Western State may be considered thrifty and judicious, the people of Michigan may, and by the official records their condition appears to be as bad as that of their neighbors in Indiana. In 1887 an attempt was made

The Burden of Debt.

by the bureau of statistics to ascertain the mortgage debt of the State through personal declarations of the owners of land. This is the best method of ascertaining the amount of existing debt; the only flaw in it being that some persons, considering that the public has no interest in their affairs, refuse to give the information. In consequence the returns are less than the reality; but in the desire to keep within the truth, we accept them as accurate. They show (report of 1888) that the real-estate mortgages of the State amount to \$129,229,553, with an annual interest payment of \$9,451,851, on a total realty valuation of \$686,614,741. Of this amount \$64,302,580 is on farms, and the annual interest charge is \$4,636,265. The farms mortgaged are 47.4 per cent of all the farms in the State, and the mortgage debt is 46.8 per cent of the assessed value of the farms mortgaged. The number of foreclosures made during the year was 1667, and in only 131 cases were redemptions made, leaving a net loss of 1536 pieces of property by foreclosure in one year. The situation apparently justifies the statement of Commissioner Heath that 'a very large proportion of the people seem to be in a financial rut, and are unable to extricate themselves.'

Mr. D. R. Goodloe, in the *Forum* for November, 1890, says:

"The conclusion from this melancholy array of facts is irresistible. The virgin soil of the West is rapidly ceasing to be the home and the possession of the sturdy American freeman. He is but a tenant at will, or a dependent upon the tender mercies of soulless corporations and absentee landlords. We have abolished monarchy, and primogeniture, and church establishments supported by the State; yet the universal curse of humanity, the monopoly of the earth by the wealthy few, remains. It is related of John Randolph of Roanoke, that when visiting a neighboring planter about 75 years ago, he found his hostess, surrounded by her female servants, making clothing for the Greeks who were struggling for liberty and independence. But while taking leave, he observed a troop of ragged slaves approaching the house; and turning, he said to the lady, 'Madam, the Greeks are at your door.' And now to America, aglow with sympathy for the Irish, may be said, 'Madam, Ireland is at your door.'"

Other writers, however, like Mr. Edward Atkinson, argue that the mortgage is an indication of prosperity. He says, in the *Forum* for May, 1895, writing (before the complete mortgage returns given above had been reported) concerning the census returns for 33 States:

"The first startling fact developed by the mortgage statistics is that in these specific 33 States and Territories nearly 7,000,000 mortgages have been recorded in ten years for a total sum of nearly \$7,500,000,000. The final statement, covering the whole country, which has not yet been published, discloses the fact that 9,517,747 mortgages were executed in the decade 1880-89, to the amount of \$12,094,877,793. . . .

"On the first of January, 1890, the amount of these mortgages remaining unpaid in 33 States was \$4,935,455,896; in the whole United States, \$6,019,679,985. It

therefore appears that during the decade one half the mortgage debt incurred had already been paid. The amount of mortgages outstanding at the beginning of this decade has not been ascertained; it can only be inferred by deductions from the growth of mortgages since its beginning. The least estimate of the sum due on acres and lots at the beginning of this period would be \$1,500,000,000.

"These original mortgages executed prior to 1880 must have been wholly liquidated, mostly by payment. Evidence obtained from solvent farm-mortgage companies proves that, as fast as they matured, they were either finally paid, or else in some instances new mortgages were executed at much lower rates of interest than were customary in the era of paper money in the previous decade. On this basis the summary would be:

Mortgages in force January 1, 1880,	
estimated.	\$1,500,000,000
Executed since.	12,000,000,000
Total.	\$13,500,000,000
In force, January 1, 1890.	6,000,000,000
Paid.	\$7,500,000,000

The payments therefore amounted to 55 per cent., yet at the end of the decade the mortgage debt on acres and lots was \$6,000,000,000.

"A loud outcry has been made by the populists and the advocates of cheap money, in support of the free coinage of silver, and other devices in fraud of both debtors and creditors alike, upon the ground that this is an unbearable burden. We must therefore wrest from these statistics their true meaning. . . .

"In order to bring out the evidence of prosperity rather than adversity developed in these conditions, one must ask, what does a man, in fact, borrow, when he executes a mortgage upon land? He does not borrow money in a true sense.

Indication

In a vast number of cases only a title to money passes in the form of a check, a draft, or a bill of exchange. What he in fact borrows is the land itself, or such part of it as the encumbrance represents. If we regard foreclosure as a sign of lack of benefit to the borrower, the figures show that in all but an insignificant proportion of these negotiations it has been as much or more to the advantage of the borrower to borrow the farm or home as it has been to the benefit of the lender in securing interest on the loan. The advantage is mutual, but distinctly greater on the part of the borrower, who has been enabled to become the owner of a homestead and the improvements thereon at lessening rates of interest throughout this period.

"In proof of these benefits the following facts are deduced from Bulletin 63 of *Farms and Homes*. Of the money borrowed on mortgage, 77.38 per cent. was borrowed for the purchase or improvement of the land. Add the sums borrowed for durable personal property of capital, and we find that more than 86 per cent. of the money borrowed was expended in the purchase or improvement of land or for durable capital used thereon. Of the money borrowed during this decade, 2.82 per cent. was borrowed to meet farm or family expenses.

"Again, one of the most startling facts disclosed by these statistics is that the total debt on acres and lots combined which was outstanding January 1, 1890, amounted to 16.67 per cent. of the true value of the real estate represented in these tables, encumbered and unencumbered. It being assumed that a mortgage debt would be safe up to two thirds the value, it appears that the actual encumbrance might have been safely increased four times. At only one third—a more conservative estimate—it could have been doubled.

"It has been stated that there is a manifest tendency to an increase in the proportion of hired farms in the older grain-growing States of the Mississippi Valley, which calls for explanation. The question arises, does this mean the growth of a landlord and tenant system, as it is commonly understood? It did not form a part of the duty of the census officials to investigate this subject, but of course this tendency attracted their attention, and while they may not rightly give any official opinion, I am assured that their views are not inconsistent with the evidence that I have obtained from other sources upon this matter. I have put questions to various persons in the grain-growing States, who are in a position to know the facts—persons connected with successful and solvent farm-mortgage companies, or chiefs of bureaus of statistics of labor, or collectors of statistical data relating to crops.

All replies are of the same general tenor. The questions put to them were substantially as follows:

"1. Does the increase in the number of hired farms indicate a tendency to the establishment of permanent relations of landlord and tenant such as are customary in Great Britain?"

"2. Does it indicate the concentration of land in fewer hands?"

"3. Does it indicate better methods of agriculture, or the reverse?"

"The summary of the replies to these questions may be given in the following terms: These lands have been taken up and settled mainly during the last 50 years by men of whom many are now

Not an Indication of Tenancy.

living. These men have, as a rule, prospered. The larger portion of them or their descendants own their farms, and many possess other property. The conditions have changed from those which are pictured in the early life of Abraham Lincoln to the condition which farmers now enjoy. A part of the other property of such farmers in many instances consists of money lent on mortgage on lots or farms in their own or neighboring States. In 102 typical counties selected from all portions of the country for the purpose of a special investigation by the census authorities, it was disclosed that 68.69 per cent. of the mortgages incurred were held by citizens of the same State in which the mortgaged real estate is. Many of those prosperous farmers have retired to towns and cities in order to educate their children and to enjoy in their latter years some of the privileges of town life—their early life having been passed in isolated places under very arduous conditions. In many cases their farms are let to their sons. In many other cases men who have not retired have leased a part of their farms to their children. In many others, again, those who have retired have let their farms to men formerly in their employ. A very small proportion are hired by farmers who have been unable to pay mortgages which have been foreclosed, who now lease the farms in the hope of recovery. There are great numbers of men who have served as hired men on farms, who have laid up their earnings, and who prefer to hire land in the neighborhood where they are known, and where they can have the benefit of schools and good surroundings, rather than to move away to take up new land on the outskirts of civilization.

"The evidence is conclusive that the increase of hired farms does not imply the permanent establishment of the relations of landlord and tenant after the English fashion. It does not imply the concentration of land in fewer hands, but rather the reverse. It does imply better and more intelligent methods of agriculture, larger and more varied crops produced from lessening areas of land throughout the whole great grain-growing section."

Mr. G. H. Holmes, writing in the *Annals of the American Academy of Political and Social Science Quarterly*, gives a more balanced view. He says:

"While mortgage debtors must admit that they have done better to obtain real estate on credit than not to obtain as much of it as they have done, or not to obtain it at all, they are nevertheless in a situation where they feel the pinching effects of a reduction or loss of income more than real-estate owners do who are not debtors. This is owing to the interest that is wanted by the mortgagee."

The mortgage, then, indicates a hope of progress, but also a slavery to interest, under which many sink.

References: See articles quoted in this article; also United States Census Reports, which give mortgage statistics in detail.

MOSES (Hebrew *Moscheh*) was the great leader of the Hebrew race, who led them out of slavery in Egypt and founded the Hebrew theocracy in Palestine. Modern scholarship has thrown grave doubts on the Mosaic authorship of the Pentateuch, but few question that Moses was a historical character and one of the greatest leaders and social reformers of the human race. There are traditions of him (Egyptian) in Manetho (Hebrew), in the *Midrash*, and Josephus (Greek) in Philo, tho they are mainly based on the Bible narrative. He was probably born at

Heliopolis in the eighteenth dynasty in Egypt, or 1500 B.C., according to the Bible chronology. His social system was a theocratic socialism, based on the fatherhood of God and the unity of the people. Land was considered as belonging to God, and the individual only allowed and protected in its use. The poor and infirm were particularly protected. (See JUDAISM; also the Bible itself: Genesis, Exodus, Leviticus, Numbers, Deuteronomy.)

MOST, JOHANN JOSEPH, was born at Augsburg in 1846, but moving to Berlin, early became known as a leader of the most violent and anarchistic wing of German socialism in connection with the International, till he was driven out of their organization by the socialists. Expelled from Berlin in 1878, he went to London, and there, in 1879, founded the *Freiheit*, an organ of anarchist communism. In 1881 he was condemned to 16 months' hard labor for his incendiary utterances concerning the assassination of the Czar. In 1882 he emigrated to New York, and has since published his paper from that city. He has been imprisoned more than once, but still remains the leading anarchist-communist in the United States. Among his writings are: *Die Lösung der sociale Frage* (Berlin, 1876); *Die Anarchie* (New York, 1888); *Social Monster* (1890).

MULTIPLE MONEY STANDARD. For the general principles involved, see MONEY; CONTRACTION AND EXPANSION OF CURRENCY; GOLD; SILVER. We give here a brief statement of the monetary idea which proposes for the standard of money a so-called *multiple standard*. We give it only in its simplest elements, appending references for the various forms in which it has been advocated. In its essence the idea is this:

That no one commodity should be used as a monetary standard, like gold or silver, but that the standard should consist of a large number of commodities combined in the following way. A monetary commission appointed by Congress would first choose a long list of standard commodities, and determine in what proportion they enter into the expenses of the average family, say, of a working man. Then it should ascertain the average market price of each commodity, and average these in proportion to the extent to which each of them has been found to enter into average expenses. This final average would be the point of departure for the multiple standard. The commission would then watch the variations in the market, and when average prices went above the average it had fixed, the commission would report to the Government, and the Government would contract the currency, and thus (see CONTRACTION AND EXPANSION OF CURRENCY) lower prices. If, on the other hand, prices went down, it would report to the Government, which would then expand the currency and raise prices, thus keeping average prices always on a level by a contracting or expanding of the currency, according as the monetary commission reported prices to have risen or fallen.

Such is the essence of the idea. It is usually proposed that it be enacted in connection with the use of paper money, since that can be most easily contracted or expanded, and since, too, this is generally conceded to be the best money,

provided that its quantity of issue be carefully controlled, which this plan would accomplish. It would leave the decision to contract or expand not to Congress, nor even to the commission, but have it follow a fixed law, the commission simply reporting on the facts. It is believed that this would take out of politics the vexed question of monetary contraction or expansion, and furnish a standard of money well-nigh invariable, because changing exactly opposite to the market, and hence producing stability. The plan has been gradually worked out by many writers. Joseph Lowe, in 1822, whom Jevons calls a very able

Authorities. writer, and Poulett Scrope, in 1833, proposed the plan of tabular standard, tho not in connection with the expanding or contracting of money. The Swiss Professor Walrus worked out this idea. Professor Marshall suggested improvements in the original plan (*Contemporary Review*, vol. ii., p. 355). President Andrews (*An Honest Dollar*, 1st ed., published by the American Economic Association, 1889) strongly urges the plan. Professor J. A. Smith devotes a long article to it in the annals of the American Academy of Political and Social Science (vol. vii., p. 173). Mr. Fonda, *Honest Money*, proposes a new detailed form of the plan. Of the tabular standard, Jevons says (*Money and the Mechanism of Exchange*, pp. 330-33):

"Such schemes for a tabular or average standard value appear to be perfectly sound and highly valuable in a theoretical point of view, and the practical difficulties are not of a serious character. . . . The difficulties in the way of such a scheme are not considerable. It would, no doubt, introduce a certain complexity into the relations of debtors and creditors, and disputes might sometimes arise as to the date of the debt whence the calculation must be made. Such difficulties would not exceed those arising from the payment of interest, which likewise depends upon the duration of the debt. The work of the commission, when once established and directed by act of Parliament, would be little more than that of accountants acting according to fixed rules. Their decisions would be of a perfectly bona fide and reliable character, because, in addition to their average results, they would be required to publish periodically the detailed tables of prices upon which their calculations were founded, and thus many persons could sufficiently verify the data and the calculations. Fraud would be out of the question."

See also PAPER MONEY.

MUN, ADRIEN ALBERT MARIE, COUNT DE, is a leading French Roman Catholic Christian Socialist. A captain of French cuirassiers, and of social position, he was instrumental in founding *L'Œuvre des Civiles Ouvriers*. (See CHRISTIAN SOCIALISM.) With gift of eloquence he has advocated his views by pen and speech, and has been frequently elected deputy. He now calls himself, however, politically not a Christian Socialist, but a *conservateur rallié*. He has twice conducted large bodies of working men to Rome to receive the papal blessing.

MUN, THOMAS, was born in London in 1571. Becoming a merchant he amassed a considerable fortune by commerce with the East. In 1628 he had charge of a petition from the merchants of Ostend to Parliament, and in 1630 he received from the Grand Duke of Tuscany

a license to trade in his dominions. He died in 1641. Mun is one of the earliest English mercantilists. His chief work, containing excellent reflections upon supply and demand, and practical conclusions which it would be well for England to apply, is still extant. It is *England's Treasure by Foreign Trade* (probably written in 1630, but not published till 1664, long after his death). It is noteworthy that, in opposition to many mercantilists, he advocated the exportation of gold when a surplus of that metal remained in the country.

MUNICIPALISM.—(For the history, statistics, present needs, and conditions of cities, see CITY. For the municipal reform movement in the United States conducted by the various municipal leagues, see MUNICIPAL REFORM. For Europe, see BERLIN; BIRMINGHAM; GLASGOW; LONDON; PARIS; also the different countries.) Municipalism may be defined as the theory, or the practice of the theory, that it is wise to extend the functions of the municipality.

In the United States, the general tendency has been to minimize the municipality's functions. The presumption is against municipal activity and for private action. Says Judge Dillon, in his authoritative work on *Municipal Corporations*:

"It is a general and undisputed proposition of law, that a municipal corporation possesses and can exercise the following powers and no others: First, those granted in express words; second, those necessarily or fairly implied in or incident to the powers expressly granted; third, those essential to the declared objects and purposes of the corporation, not simply convenient, but indispensable. Any fair, reasonable doubt concerning the existence of power is resolved by the courts against the corporation, and the power is denied. Of every municipal corporation the charter, or statute by which it is created, is its organic act. Neither the corporation nor its officers can do any act, or make any contract, or incur any liability, not authorized thereby. All acts beyond the scope of the powers granted are void. . . . These principles are of transcendent importance, and lie at the foundation of the law of municipal corporations."

In Europe, the opposite is the case. The result is that in America the corporate city, being thought little of, has been left, generally speaking, to be managed by a low class of politicians, and thus to become corrupt and weak; while in Europe, the function of the city being highly conceived, city offices have attracted to themselves some of the best and ablest citizens, and thus the European city has become, as compared with American cities, efficient and pure. At least such is the view of many municipalists. The only way to purify American city governments, such municipalists argue, is to exalt and expand the city's function. This, too, they say, is cheaper and better in every way for the citizens than to allow its streets to be given over to the control of private street railway companies, its gas, electric lighting, and other natural monopolies to be provided by favored companies, which think first of dividend and secondly of the public convenience. Such is the theory of municipalism in brief. Many, moreover, who would not agree to any such general propositions as the above, do believe in much of the municipalist program, considering, however, each case concretely on its merits. We must, therefore, refer the reader for the details of mu-

nicipalism to BATHS ; ELECTRIC LIGHTING ; FIRE DEPARTMENT ; GAS ; LAVATORIES ; STREET RAILWAYS ; NATURAL MONOPOLIES, etc. (For examples of municipalism, see BERLIN ; BIRMINGHAM ; GLASGOW ; LONDON ; PARIS.) We give here a few representative general views.

Says Mr. Francis Bellamy, in an address on *Municipal Government*, delivered in New Haven, November 11, 1890 :

"Why is the municipal government of Berlin or Birmingham or Glasgow so much less corrupt and more efficient than ours? Certainly not because their citizens are more intelligent or more moral than Americans. One reason certainly is that the machinery is more simple and direct. But the deepest reason is that the functions are so much more extensive that not only are the most capable men led to take office, but the people generally are attentive to the problems which the many-sided business of the city presents.

"If it is objected that monopolies should be kept out of politics, we can only reply that monopolies are in politics. They depend on legislatures and city councils and on politicians and lobbyists for their very existence. Private monopolies have debauched our politics, and are a continual menace to uncorrupted government. Our recent West End Railway scandal in Boston is only less than the Broadway surface bribery of New York aldermen ; but both go to show how terrible is the pressure which great natural monopolies can bring to bear to extort franchises. The interests of such immense enterprises as elevated railways, surface railways, gas-works, electric lighting plants and water-works are necessarily antagonistic to the interests of the public. They serve the people, but their motive is dividends and not the comfort of the people or the improvement of the city. They absorb the best business talent and the best legal shrewdness into their service, that they may secure privileges at public sacrifice. They employ a candidate for Governor of Massachusetts to defeat in legislative committee the natural petition of Danvers town people that they may be allowed to do their own electric lighting. And they employ an ex-Governor of Massachusetts to lobby for the passage of an elevated railroad bill, which gives fullest freedom to the company, without the public receiving a dollar of compensation. Monopolies will be in politics in a bad sense until the people take them into politics in a good sense by undertaking their operation themselves. In this way, too, municipal reform is more apt to follow extension of the city's business than to go before it."

Says Professor R. T. Ely (*Christian Union*, now *The Outlook*, October 9, 1890) :

"We are reversing the order of nature in planning to reform city government first, and then to carry out the changes I have mentioned, and to make improvements in behalf of the poorer classes. Let any one name a city where this policy has been successfully pursued. I know of none.

"When the Hon. Joseph Chamberlain and his friends took hold of the corrupt and inefficient city government of Birmingham, they at once 'devised large measures,' including the purchase of gas and water-works by the city. A public library followed ; public parks, improved dwellings for the poor, large public undertakings, broad and generous measures have been an essential part of municipal reform and improvement in cities like Berlin and Glasgow ; they have not followed a purification of politics, but have helped to elevate political life.

"Has the experience of this country been different? Not at all. When the city government of Baltimore was worse than it is to-day, when the 'Plug Uglies' and 'Blood Tubs' were a terror, the government was improved by adding to its functions a paid police and a paid fire department. Extension of functions within a proper sphere improves government.

"It may be urged, perhaps, that the difference of institutions between a monarchical country, like Germany or England, and a republican country, like the United States, is radical, and that things are done for the people in those countries. This is fortunately not the case. The truth is, that cities and towns have in both of these countries—Germany and England—a power which ours are far from possessing. They have more local self-government than we. They are not obliged, like Massachusetts towns, vainly to petition a legislature for authority to construct gas

works and to establish an electric lighting plant. Such powers are either possessed, as a matter of course, or are conferred by general laws.

"It is well again to make comparisons. Fifty or sixty years ago city government in England was a disgrace to the country. Has improvement come by means incompatible with democratic institutions? On the contrary, as city government has improved it has become more democratic. Germany has also become more democratic, while the local administration has been improving. There may be some limitations

Municipal Corruption.

upon the suffrage in English local politics still, and in a German city like Berlin the vote of a rich man may count for more than the vote of a poor man ; but these limitations do not account for their superior local governments. These are among the differences between us and them which are growing less. And with us it is unscrupulous wealth which rules and corrupts our cities. What influence, comparatively speaking, have working men in our politics? Was Jacob Sharp a wage-earner? Were the manipulators of the West End scandal in the Massachusetts Legislature dwellers in the slums of Boston? Does any sane man in Baltimore who wishes to work a measure through our City Council rely upon the assistance of leaders of working men? I have some idea of what I would do in Baltimore. I know the men whom I would approach, but they are not wage-earners. President Seth Low has said that his study and actual experience as Mayor of Brooklyn have convinced him that universal suffrage is not the cause of bad city governments. He says he did not find wealth always ready to cooperate, and he believes that our cities could not have made so rapid progress as they have without universal suffrage."

Those who object to this view generally argue that municipal enterprises are expensive and ineffective. *Liberty*, the organ of the philosophical anarchists in America (see ANARCHISM), quotes, in its issue of August 1, 1896, a writer in the *New-Objections*.

castle *Chronicle*, who affirms of the municipal baths and wash-houses of that city (Newcastle, England) that the number of persons using them has decreased 50,325 from 1890-95, while the expenditures for them has risen £500, salaries having increased from £1677 to £2039. The municipalization of horse cars in Huddersfield, he affirms, has necessitated the imposition of a rate of 5d. on the pound. The wrangling of the Newcastle Council over tramways has made it forget its hygienic duties, till scarlet-fever and diphtheria were rampant in certain quarters of the city.

Municipalists, however, are not much disturbed by examples of municipal mismanagement. They believe, in the first place, that such examples can be easily matched by the mismanagement of the countless private corporations, which fail, or which succeed only by inflicting hot, crowded, filthy cars, or impure water, or poor gas upon a long-suffering public. Secondly, they assert that municipal management cannot at first be expected always to excel private management in matters where the latter has had long experience and the city but little. Yet the fact is that tho no one claims perfection for city management, what it has undertaken to do a growing number of careful students, not prejudiced by any theory, believe to be

Answer.

far better done than the privately conducted interests. Work done directly by the city (see CONTRACT LABOR) is being found, where tried, to be surprisingly better and cheaper than private work. Municipal street cars, gas, electric lighting, furnish strong evidence for municipalization. (See those

subjects.) In 1867 a private company was organized to build the Brooklyn Bridge. The charter placed the original capital stock at \$5,000,000. Of this Brooklyn gave \$3,000,000; New York, \$1,500,000; private stockholders, \$500,000. Yet tho the private stockholders gave only one tenth of the amount, they had all the power. Six *ex officio* members represented the cities on the board of 21 directors, but they had no vote in electing other directors, and the whole power was put into the hands of the executive committee. The result was scandalous jobbery and mismanagement. Contracts for portions of the work were let to favored stockholders, etc. In order to save the bridge, the cities had to buy it of the private stockholders, after which its building was a success. A committee of the cities, appointed later, with such men as Abram S. Hewitt upon it, reported that there had been practically no mismanagement except under the private management. If this took place under corrupt New York and Brooklyn, municipalists argue, what might not be expected of purified municipalities?

Municipalization, too, is cheaper, and lowers taxes. Berlin, Paris, etc., receive large incomes from their municipal undertakings. Mayor Clark, of the city of Marquette, in Michigan, once declared that the revenue from the electric and other plants owned by that city were almost enough then, and by expansion could be made actually enough to meet all the expenses of the city without taxation of any kind. As the argument for municipalization, however, turns on concrete details, it must be studied under the head of the various natural monopolies. (See MONOPOLIES; NATURAL MONOPOLIES; SOCIALISM; INDIVIDUALISM.)

MUNICIPAL REFORM.—(For the history, statistics, evils, and needs of modern cities, see CITY. For the reform of cities on lines of municipalism, see MUNICIPALISM. For conditions and movements in Europe, see BERLIN; BIRMINGHAM; GLASGOW; LONDON; PARIS; CITY.) We consider in this article the movements and societies for municipal reform which have sprung up recently in all the larger American cities on somewhat varying lines, but in general sympathy both as to aims and methods, and now federated in a National Municipal League.

The occasion for this movement was undoubtedly the unequalled corruption and degradation of American municipal political life and administration. Says Mr. Bryce (*The American Commonwealth*, revised edition, Part II., chap. ii.): "There is no denying that the government of cities is the one conspicuous failure of the United States." Consciousness of this having grown among the more educated classes in America (see CITY), the movement to reform the evil has sprung up gradually, and recently to an extent justifying its being called by Dr. Albert Shaw, in the *Review of Reviews* for April, 1895, *Our Civic Renaissance*.

Spasmodic efforts and uprisings of indignant citizens against some extreme display of municipal corruption or mismanagement have long been known in America, but have accomplished little permanent, and not even much temporary

good. The powers of evil, with their machine organizations, party bosses and heelers, entrenched in the saloons, and extorting and receiving contributions from corporations in exchange for franchises, etc., have proved too much for spasmodic efforts at reform. It was a fight of unorganized volunteers against organized regulars. Usually the result was

Needs.

that the reformers, after a passing effort, gave up the battle as hopeless, or, having won a passing victory, retired to let the enemy immediately regain all that had been won. The thought of the new municipal movement has been that our cities can only be rescued from evil by the permanent organization and continued watchfulness of the forces of good. This thought has been helped by a growing ideal on the part of some of the true city life. The general tendency in America has been to despise government and magnify private action. The natural result has been that government, and especially our municipal governments, have been left, generally speaking, to our more ignorant citizens, while the abler and more educated classes have largely left politics alone. The evil of this having been seen, there has been a growing willingness of able men to devote time to city problems, and even to accept office. Examples of this are the election of Mr. Seth Low as Mayor of Brooklyn, the mayoralty of Mr. Hewitt in New York, the activity of such men as Theodore Roosevelt in the same city. But this was soon seen not to be enough, and that there was a necessity for organizing against corruption. The socialist critics of the municipal reform movement said that it did not go far enough; that municipal government could never be pure and attract strong men to it till its functions were expanded, and the city had large things to do. As long, they argued, as private corporations conducted the great natural monopolies (*q.v.*) of the city and made large fortunes they would be, and must be, the socialists argued, a corrupting element on the less important city administration. Just so long as they did the main things they could employ and attract the ablest men to service outside or inside of government circles. The way to reform, said the socialists, was, first, to exalt the city corporation over the private corporation, as it is in Europe, and not to allow the private corporation to overshadow the city, as it is in America. (For this argument, however, see MUNICIPALISM.) The municipal reform movement we are now considering, while it has had within it those who have ably voiced this thought, has not as a whole been committed to this idea. We point this out to explain the fact that the movement has not attracted to itself the more radical municipal reformers nor many of the working classes. It has been chiefly a movement of business and professional men, its main endeavors being to organize for the enforcement of such laws as we now have and the simplification and purification of administration. More radical reformers have declared that the great corporations in some of our larger cities have been represented in this municipal reform movement by stockholders, etc., so that it has been prevented from going far on lines of mu-

nicipalism, while in New York City, for example, great division and popular hostility have resulted to some portions and persons of the reform forces on the questions of Sunday closing, the wages paid to some city employees, etc. It has been declared that it was simply a business man's movement carrying into city politics all the sharp practices and cutting of wages, etc., which in the popular mind at least characterize modern business. Thus in every way in many cities a cleavage has arisen between the municipal reformers, who seek primarily to reform administration, and the municipalizers, who seek municipalism. In all cities, however, there have been some in the municipal reform movement who have advocated municipalism; there has been a general tendency to favor some municipalizing steps, such as opening city baths, lavatories (*q. v.*), enforcing strict control over tenements, streets, etc., while in some cities the reform movement has gone much farther in this direction. With this general presentation of the aims of the movement we give a brief notice of some of the more important city leagues and of the more recently formed National Municipal League.

One of the first cities to have a league for the purification of city administration was Baltimore, where, in 1885, a Reform League, after an unusually corrupt election, was formed "to secure fair elections, promote honest government, and to expose and bring to punishment official misconduct in the State of Maryland, and especially in the city of Baltimore."

Beginnings.

Several registers and election judges were convicted of fraud and imprisoned. Several cities, however, had citizens' associations against political frauds before this. Chicago had one as early as 1874. The preamble of this association's constitution states:

"In order to insure a more perfect administration in our municipal affairs; to promote the general welfare and prosperity of the city; to protect citizens, so far as possible, against the evils of careless or corrupt legislation; to effect the prompt enforcement and execution of the law; to foster and encourage all enterprises necessary and calculated to develop and extend our business and commercial interests; to protect and maintain our credit, both at home and abroad; to secure such legislation, both State and national, as the interests of the city may from time to time require; to arouse a more widely extended interest in our municipal legislation and administration; to correct existing abuses, and to prevent their future recurrence; and believing that, to secure these ends, organized and united action is necessary."

Law and order leagues (*q. v.*) sprang up about this time, and a National Law and Order League was established in Boston in 1883. A Massachusetts Society for Promoting Good Citizenship was organized in 1887. A Citizens' Municipal Association was organized in Philadelphia in 1886. A Citizens' Association in Boston was formed in 1887.

In New York City, a Society for the Prevention of Crime had been organized October 22, 1878. Its objects were

"to promote in all proper and suitable ways the removal of sources and causes of crime; to assist the weak and helpless in obtaining the protection of the courts and of the laws regulating the sale of intoxicating drinks, and in protecting themselves against the temptations to crime; to aid in the enforcement of the laws of this State; to disseminate information, and to

arouse a correct public opinion in support of all laws, organizing and forming meetings and associations for instruction and discussion upon such topics."

Under the presidency of Dr. Howard Crosby, it did good work along its corporate lines; but in its work the collusion between criminals and the officers of the law became evident, and when, upon Dr. Crosby's death in 1892, Dr. C. H. Parkhurst (*q. v.*) became its president, he devoted himself to exposing this connection. He said:

"Experience had shown that very little can be accomplished by the occasional closing of an isolated saloon illegally run, or by the prosecution of any single gambler or bawdy-house keeper, so long as the conditions exist which render it possible for illegal practices of the sort to maintain themselves so concertedly, so confidently, and so defiantly. If an attempt is made to suppress a gambling-house, for instance, the prime difficulty that we have to encounter is not in dealing with the proprietor himself, but in dealing with the support which he receives from the authorities, whose sworn duty it is to detect and arrest him. Till the alliance is broken which exists between the criminals and their proper prosecutions, it is bailing out water with a sieve to attempt the extinguishment of individual gambling-houses or bawdy-houses. . . . This is a sufficient reply to the question sometimes put, why it is that we do not cooperate with the Police Department. . . . If the department would do what the public pays them for doing, we would disband, and be glad to. The very existence of such a society as ours is, properly interpreted, a standing indictment of police incompetency or criminality. We cannot work with them then, for the simple reason that we are organized to suppress crime, and the attitude of the department is one of the greatest obstacles that we have to encounter in doing it."

New York.

The resulting exposure of the department by Dr. Parkhurst and his fellow-workers, the Lexow Investigation, are well known. (See PARKHURST; LEXOW COMMITTEE.) As one result, a City Vigilance League was formed in 1892. Its objects were

"to quicken among its members an appreciation of their municipal obligations; to acquaint them with existing conditions; to familiarize them with the machinery of municipal government; to make conspicuous the respect in which such government is languidly or criminally administered; to regard with jealous concern the point at which private interest enters into competition with the general good; and in every possible way to repress in the community what makes for its detriment, and to foster whatsoever seems fitted to promote its advantage."

Its methods were

"the collection and dissemination of full and accurate data concerning our municipal conditions; by legislation; by legal proceedings; by the hearty support of officials who discharge their duties faithfully, and the vigorous prosecution of those who neglect them; and by the creation of a public sentiment in furtherance of the objects of the League."

It established an organ, *The City Vigilant*, edited by W. H. Tolman, Ph.D. By August, 1893, Dr. Parkhurst wrote:

"Between 400 and 500 men are already actually at work in the field. Operations have been commenced in 22 out of the 30 Assembly districts. Whatever concerns the interests of our city is made subject of inquiry and conference."

Meanwhile, Mr. Edmund Kelly had organized, in 1892, the City Club of New York, and this club organized in different parts of the city some 20 Good Government Clubs (*q. v.*), which, in 1894, were federated under a Council of Confederated Good Government Clubs. It was the forces in the Good Government Clubs and the

City Vigilance League, with representatives of the Chamber of Commerce, which held a conference September 6, 1894, and appointed a Committee of Seventy to oppose the Tammany machine—somewhat similar to a Committee of Fifty created by a mass meeting November 13, 1893. The Committee of Fifty, however, had simply engaged in prosecuting election frauds, etc.; the Committee of Seventy went farther. It succeeded in defeating Tammany in the city elections and putting civil service and other reformers into some of the departments—as Mr. Roosevelt as a police commissioner. It also appointed various sub-committees, as on street cleaning, public baths and lavatories, small parks, tenement-house reform, etc. As a result, various reforms have been commenced in New York City. A commission was appointed by the city to investigate the condition of the tenements, and its report, coupled with the efforts of various society and settlements (see UNIVERSITY SETTLEMENTS), is resulting in the tearing down of some of the worst slums, the opening of several small parks, the opening of public baths, lavatories, etc. It is hoped that this work of this committee will develop a permanent organization, like the Civic Federation of Chicago.

Through other cities there has been a wave of organization on this line. The Civic Federation of Chicago owes its origin to the visit of Mr. W. T. Stead (*g.v.*), his revelations of the corruption there, and his effort to federate the moral forces of that city in civic and social work. The Federation was incorporated in February, 1894, with the banker, Mr. Lyman J. Gage, at its head, and Mrs. Palmer as its first vice-president. Mr. R. M. Easley has been its active secretary. It has a central council of 134 members, 7 large standing committees, and 34 ward councils. Mr. Gage is quoted in the *Review of Reviews* as saying of it:

"The idea of the Civic Federation is primarily an educational one. Its policy is to focus all the forces now laboring to advance the municipal, philanthropic, industrial, and moral interests of Chicago. It believes in the theory that in union there is strength, and it invites the cooperation of all societies and organizations, regardless of party or sect, in its efforts to raise the standard and ethics of municipal life in Chicago. The Civic Federation does its work through six different departments and under the auspices of committees selected especially for their fitness for the different lines of work. In a broad sense our association aims to accomplish the development of public sentiment toward the following results: First, in the political field, the selection of clean and honorable men for aldermen; state and municipal legislation in the interest of Chicago. In the municipal field, clean streets and alleys, improved urban traffic accommodations, honorable police, less smoke, more water, etc. In the industrial, the establishment of boards of conciliation, public employment bureau, etc. In the moral work, the people are pretty well acquainted with our efforts to suppress gambling. . . .

"But all this is incidental to the main object of the Federation—that is to educate the people, the taxpayers of Chicago, to a sense of their municipal duties; to arouse them to the necessity of action and vigilant effort, that corrupt influences and elements may be driven out and the city eventually redeemed from politics and politicians."

As a result, Chicago in 1895 gained a substantial victory for civil service reform; it remains to be seen with what enduring results. According to some the wealth of Chicago is so entwined

with interests aided by the corrupt gaining of franchises, etc., that it is questionable whether reform can come except by radical changes.

The Municipal Reform League of Boston is older. It had its origin in an address by Mr. Samuel B. Capen in March, 1892, in which the necessity for a cooperation of the best civic and moral forces of metropolitan Boston was stirring set forth. There resulted an organization under Mr. Capen's leadership out of which the present Municipal League has come by a process of healthy evolution. The League at present is limited to a membership of 250. It includes representatives of a great number of societies and organizations, some of these being trade bodies and business men's associations, others being religious and philanthropic societies. Its active secretary is Mr. Edwin D. Mead, editor of the *New England Magazine*. The League has agitated for a three-years' term for the mayor, the abolition of the Common Council, and the enlargement of the Board of Aldermen to 25, with salaries of \$3000 and no allowances for expenses, and the adoption of proportional representation in municipal elections.

The Municipal League of Philadelphia is among the largest and best in the country. It was organized in 1892. Its president is Mr. George Burnham, Jr. Its secretary, Mr. C. R. Woodruff, writes in the *Review of Reviews*:

"The Municipal League aims to combine for conference and cooperation all citizens who desire good city government. It believes in the practical separation of municipal from State and national politics; the nomination of none but those who are honest and capable; the application of civil service reform principles to all appointments; the rigid enforcement of public contracts, and no grants of municipal franchises except for limited periods and upon the best obtainable terms. There are no dues and the league is dependent on subscriptions for its necessary expenses. The by-laws provide for the nomination of candidates whenever it may seem expedient, but no member is expected to support a nomination which he cannot approve.

"The above is a succinct statement of the aims and objects of the Philadelphia Municipal League, one of the largest, most active, and influential organizations in the United States working for permanent municipal reform. With upward of 3500 members, it has active associations in over one third of the wards of the city, and in many of these ward associations the election divisions (into which the wards are divided) are organized in behalf of the cause of better city government. The importance of this kind of organization is appreciated when we learn that the dominant Republican Party has a group of active workers in every one of the 930 election divisions. There are about 10,000 office-holders, and these are so distributed as to average 10 workers to a division. This 'regular' army of trained politicians is always to be depended upon to get out the vote, carry primaries, or do any other needed work, such as the collection of assessments, the naturalization of foreigners, or the securing of signatures to petition for a pardon, or the endorsement of an ambitious candidate. We cannot expect to make much headway or accomplish much in the way of permanent results until the advocates of good city government are also adequately organized into trained and efficient bodies of workers."

In Philadelphia the women have been particularly active in municipal reform. They organized a Civic Club January 1, 1894, and actively carry on many departments of study and work.

Such are some of the representative organizations of the movement. They are now united in a National Municipal League, organized in New York City in April, 1894, as the result of a Na-

tional Conference for Good City Government, held in Philadelphia, January, 1894.

According to its constitution, the League has a threefold object :

1. To multiply the numbers, harmonize the methods, and combine the forces of all who realize that it is only by united action and organization that good citizens can secure the adoption of good laws and the selection of men of trained ability and proved integrity for all municipal positions, or prevent the success of incompetent or corrupt candidates for public office.

2. To promote the thorough investigation and discussion of the conditions and details of civic administration, and of the methods for selecting and appointing officials in American cities, and of laws and ordinances relating to such subjects.

3. To provide for such meetings and conferences, and for the preparation and circulation of such addresses and other literature, as may seem likely to advance the cause of good city government.

The league is managed by a board of delegates chosen by the associations composing it. Each association is entitled to appoint, from time to time, as many delegates as it may see fit, and each delegate shall retain his position until he is withdrawn, or his successor is qualified, or his association becomes inactive.

The annual fee for associate members is \$5. The league has no organ of its own, but from time to time issues leaflets on some topic connected with good government.

The present president is James C. Carter, of New York, and the secretary C. R. Woodruff, of Philadelphia. The annual conferences of this league have become important as discussing all forms of municipal reform. At the Baltimore convention of 1896 the secretary reported leagues in all the larger cities, over 200. In Baltimore and New Orleans especially important victories have been won.

References : See CITY. The *Review of Reviews* gives the latest news of the reform movement. The *Annals of the American Academy of Political and Social Science* has a valuable department on municipal government.

MÜNZER, THOMAS, was born at Stolberg about 1490. Studying at Leipzig, he became a preacher, and at first worked in unison with the reformers, but later turned against the "halfness" of Luther and Melancthon, and, led by what he believed "inner light," demanded a radical reform of Church and State. He held usual Anabaptist ideas about baptism, but was not otherwise identified with the Anabaptists (*q. v.*). He believed in continuous divine revelation and in community of property. He promulgated these ideas in popular and effective tho sometimes coarse speech. Expelled from Allstädt, where he had been preacher, he settled at last in Mühlhausen, and succeeded here in overthrowing the council and gaining a new one under his control. When the Peasants' War (*q. v.*) broke out he induced the whole population of the vicinity to rise. The peasants, however, were defeated at Frankenhausen, May 25, 1525. Münzer was captured, tortured, and beheaded at Mühlhausen a few days later.

MUTUAL BANKING.—By this phrase is usually meant a monetary system first formulated by Colonel William B. Greene, of Boston, about 1850. It has been somewhat modified, but is to-day advocated by most extreme individualists. A mutual bank propaganda was started in Chicago. Its secretary, Mr. Westrup, describes the plan in his *The Financial Problem*, as follows :

"To state that interest for money loaned on good security is irrational, and that its abolition is not dependent upon philanthropic motive, but upon business principle, and therefore unavoidable, is to either startle the 'civilized' world or else to evoke ridicule. To state that savings banks are economic absurdities, and that history gives no greater evidence of man's folly than in their establishment, is to become not only the laughing-stock of superficial thinkers, but to be regarded as *non compos mentis* by 'learned' writers on political economy. . . .

"The proof that interest upon money loaned on good security is irrational is the fact that good security is wealth, and that what the borrower obtains is merely something which enables him to avail himself of the use of his wealth as capital, without cutting it up into small pieces, as is done with the wealth consisting of the metals used as money, but which in his case is impossible. The banker lends his credit, and the borrower pledges his wealth, the banker being far more secure than the holder of the banker's paper. The banker takes pay for the use of capital, altho he furnishes none; for the capital (wealth) is furnished by the borrower. The banker, therefore, renders no more service to the borrower than he would if, both using in every way the same kind of spectacles, the borrower should hand his to the banker, while he borrowed the banker's for his own use. . . .

"The present essay is intended to show that present as well as all past monetary systems are as unscientific and the popular views of money as incorrect as the notions entertained in regard to astronomy before the days of Copernicus.

"As much of this comes of a misunderstanding of the definition of terms, in order to arrive at comprehensive views on this subject, I shall commence by giving the definitions of such terms as I shall make use of, and in regard to the meaning of which there exists a confusion of ideas. . . .

"Money cannot properly be called wealth, altho it is wealth to the extent of the market value of the material of which it is composed, as is the case when it is made of gold, silver, etc.; but it is not wealth when it is made of paper, for the wealth contained in a paper dollar or 1000 paper dollars is too insignificant to be called wealth, or rather to warrant the statement that such money is wealth. Hence to call money wealth is incorrect, for that would imply that *all* money is wealth, whereas, as I have already shown, some kinds of money is not wealth. Therefore, in defining money, I say money is a representative of wealth; or, to state it more fully, money is the circulating medium; its office is to facilitate the exchange of the products of labor; its nature is a representative of wealth.

"I do not expect opposition to my first two propositions—*viz.*, that money is the circulating medium or that its office is to facilitate the exchange of the products of labor; but to my third proposition—*viz.*, that the definition of money which relates to its nature is *not* wealth, but a *representative of wealth*, I anticipate opposition from a certain quarter. For instance an opponent might argue that money is wealth, and attempt to prove it by the fact that the possessor of \$1,000,000, even in paper money, is a wealthy individual. I do not deny this, yet it does not conflict with my definition. He is a wealthy individual, because he possesses the representative of \$1,000,000 worth of wealth, and can exchange it for wealth at any time. But to say that that individual is the *possessor* of wealth would not be correct, for he is the possessor of wealth only to the extent of the market value of the paper stock contained in the said paper money. We cannot too strongly urge the importance of recognizing this distinction; for by so doing we admit the fact that we do not increase wealth by issuing paper money; yet by issuing paper money amply secured, we increase in the same proportion the available capital for the purpose of productive enterprise, and at the same time, as will be seen by the plan for mutual banks, destroy that which is the bane of all modern enterprise, usury!

"**COST.**—The term cost is meant by the present

writer to denote the net expense of production, exclusive of any profit.

"BARTER.—This term is given to that transaction which is an exchange of wealth for wealth, or one product of labor for another product of labor; such as a house for a farm, a watch for a horse, a pair of shoes for a hat, or all these for specie. Specie is a species of wealth; therefore, to purchase with specie is barter.

"Having given definitions of the terms in regard to the meaning of which I might be misunderstood, I will now proceed with our subject. My object being to prove that the money question is a subject of science, and that there are principles by which we can test the correctness of a money system, I will first state what those principles are and then test the correctness of prevailing systems by their application.

"1. Money being a representative of wealth, a money system must provide a sufficient volume and facilities to enable all wealth to be represented by money.

"2. As interest for money loaned is not 'compensation for the use of capital,' the borrower possessing the capital (wealth), and needing but the representative (except in cases where money is loaned without security), a money system must provide for the loaning of this representative at cost.

"3. As the holder of a bank bill or government note is not thereby the possessor of wealth, a money system must provide absolute security against loss to the holder of paper money.

"The three foregoing principles constitute, in my judgment, the basis of a correct money system, and any system that does not fulfill their requirements is defective, and fails to supply what is wanted as their application to the following systems will show."

The following is the plan for a mutual bank :

"1. The inhabitants or any portion of the inhabitants of any town or city may organize themselves into a mutual banking company.

"2. The officers of a mutual bank should be a board of directors, an appraiser, a manager, a cashier, and a secretary.

"3. Those who propose to become members should elect the appraiser and the board of directors, who should hold their office for one year.

"4. The board of directors should first elect the manager, cashier, and secretary from among their number.

"5. The manager, cashier, and secretary should hold office until they resign or are removed by the board of directors, who should require each to give bonds. They should be subject to and not members of the board, nor participate in its meetings, except when called upon to do so; and the same rule should govern the appraiser.

"6. The appraiser and members of the board may be removed at a general meeting of the members of the bank, and others elected to fill their places, of which due notice should be given.

"7. Membership ceases when a member pays his notes to the bank, and none but members should be directors.

"8. The board of directors should employ a secretary of its own and a legal adviser, and fix the salary of the officers and employees.

"9. The manager should manage the affairs of the bank, the cashier the usual duties, and the secretary should have charge of all documents, see that all mortgages are duly recorded before notes are discounted by the bank, and keep an account of the printing and issue of bills.

"10. Any person may become a member of the mutual banking company, of any particular town or city, by pledging *unencumbered improved real estate, never vacant lands*, situated in that town or city, or in its immediate neighborhood, or other first-class collateral to the bank.

"11. The mutual bank should print (or have printed) paper money, with which to discount the notes of its members, and should always furnish new bills for torn or soiled ones when requested, free of charge.

"12. Every member, at the time his note is discounted by the bank, should bind himself, and be bound in due legal form, to receive in payment of debts at par, and from all persons, the bills issued and to be issued by the bank.

"13. Notes falling due may be renewed by the bank, subject to the modification which a new valuation may require, so that the note does not exceed two thirds.

"14. Any person may borrow the paper money of a

mutual bank on his own note not extending beyond 12 months (without endorsement), to an amount not to exceed two thirds of the value of the collateral pledged by him.

"15. The charge which the mutual bank should make for the loans should be determined by and, if possible, not exceed the expenses of the institution, *pro rata*.

"16. No money should be loaned by the bank except on the above conditions.

"17. Any member may have his property released from pledge and be himself released from all obligations to the mutual bank, and to the holders of its bills as such, by paying his note or notes to the said bank.

"18. The mutual bank shall receive none other than its own money, or that of similar institutions, except such coin money as the board of directors may designate, and this should be discounted one half of one per cent.

"19. All mutual banks may enter into such arrangements with each other as shall enable them to receive each other's bills.

"20. The mutual bank should publish in one or more daily papers each day a statement of its loans the day previous, describing the property pledged, giving the owner's name and its location, with the appraiser's value and the amount loaned on it, and also a statement of the notes paid and mortgages cancelled during the same period, which statement should be signed by the manager, cashier, and secretary.

"21. The mutual bank should exchange, at any time, any of its own bills that are torn or worn for new ones without charge."

To this plan socialists say that the main, and in one sense the only but sufficient objection is that unless all entered into this mutual system it would not serve the complete needs of society as a medium of exchange, so that government or some other organization would still have to provide money; and that when all did enter into it it would be a monetary cooperative commonwealth, such as democratic socialism is more speedily leading us to realize. Till we have this, government needs to control the issue of money in order to prevent the ignorant and innocent from being deceived by the speculator and the sharper. (See ANARCHISM; SOCIALISM.)

MUTUALISM is a term preferred by some, like the late Bishop Brooks, in place of socialism. Professor Frank Parsons, who has made the term known in his books, *The Philosophy of Mutualism* and *Our Country's Need*, contributes the following statement of it :

"The term mutualism is used to denote a condition of society in which the governing principle is mutual help. When two persons work together in partnership or live together in harmonious family life we have mutualism in miniature. When the principle of partnership or union of ownership, effort and control for the common benefit, shall be extended to the whole social life of city, State, and nation, we shall have a mutualism complete upon the plane of justice. And when love and brotherhood become the animating principle of the partnership, and each member of society not merely cooperates with the rest, but *devotes* himself to the welfare of the rest, we shall have a mutualism of the loftiest type. The earlier outward steps toward mutualism are the public ownership of monopolies and the growth of cooperative enterprises, which processes, meeting each other half way, will bring about a common ownership of the means of production and distribution, industrial self-government or democracy, economic equality, and a cooperative character. Finally men will come to know that the joys of intellectual and spiritual activity infinitely exceed the pleasures of the senses. Then they will wish for wealth merely so far as it may be a means of fitting them for the noblest intellectual and spiritual life. They will also learn that the richest and most enduring happiness can only be won through the happiness of others—learn it not in words alone, but in thoughts and emotions sufficiently strong to sway their conduct. Then the golden rule and brother love and devotion will become the real governing law of daily life, and mutualism will have reached its goal."

N

NASSE, ERWIN, was born at Bonn, December 2, 1829; studied there and at Göttingen, and took his degree of Doctor in 1851. After study in Berlin he established himself as *privat-docent* in Bonn, in 1854, whence he was called, in the Spring of 1856, as professor, to Basel, and in the Fall of the same year to Rostock. In 1860 he came to his native city as professor. He took an active part in political affairs, and was from 1869 to 1879 member of the Prussian House of Deputies, where he rendered important services on the budget commission. He was one of the founders of the *Verein für Socialpolitik* (see Socialists of the Chair) and the president of it from 1874 to his death, January 4, 1890. Professor Nasse was a frequent contributor to scientific journals, and the list of his writings is made up largely of the titles of these essays.

NATION AND NATIONALITY.—Blüntschi, in his *The Theory of the State* (tr. from the German, p. 90), defines a nation as "a society of all the members of a state as united and organized in the State." He thus makes it a concept dependent upon the State. The State he defines (*idem*, p. 23) as "the politically organized national person of a definite country." The two definitions are thus made mutually dependent, and the same dependence will be found to run through almost all definitions, because the ideas are themselves mutually dependent. It is scarcely possible to have a nation that is not a state, nor a state that is not a nation. Nevertheless the two words, tho often used, even by careful writers, somewhat synonymously, and though continually popularly confused, are not absolutely synonymous. A state is a nation politically organized. A nation is the organic collectivity of all the people in a state, implying indeed a political organism, but not limiting the collectivity to its political aspect. The concept people, on the other hand, is still wider than the concept a nation. The word people implies the collectivity of persons living in a state, but does not conceive it as an organic unity, political or of any sort. It conceives of them as a whole and perhaps as a united whole, but not as an organized whole. Such are the differences, or shades of difference, that are usually made by English writers between these three words. Nevertheless, the distinctions are not always observed, even by the best writers. In other languages too the word nation is used quite differently. The Germans call a people a *nation*, and what we mean by nation they call a *volk*. The old Latin *natio* meant what we mean by people. Indeed the conception *nation* as of the organic unity of a people may be considered a wholly modern conception. Despotism knows nothing of a *nation*. It only recognizes peoples and states.

Analyzing more carefully the conception nation, we find *first* that a nation implies a certain territory in which it must live. Says Woolsey (*Introduction to Inter. Law*, § 52): "A nation is an organized community within a certain territory; or in other words there must be a place where its sole sovereignty is exercised." A nation may be conceived as changing its country, but it must have a country, at least in prospect. It is scarcely possible to-day to speak of the Jewish nation. Secondly, a nation must have a natural unity; ordinarily, tho not always, it must be composed of persons of the same ethnic family and speaking the same language, or at least cognate languages. Even when this does not exist, as it does not wholly in the United States, nevertheless there must be a national unity besides that of place. M. W. Ward says (*Eng. Dram. Lit.*, Int. p. xvi): "A nation may be defined as a body of population which its proper history has made one in itself, and as such distinct from all others." A nation thus is a growth. We see this in the derivation of the word from *nasci*, to be born. Unity of race, of language, of religion, of civilization, of government, of experience, of place, all contribute in varying degree to gradually separate one nation from another. Thirdly, a nation must have some conscious and expressed unity. It must have somewhat of a common will. Blüntschi calls it a *collective personality*.

These conceptions and definitions may be illustrated by pointing out that Italy and Germany were nations long before they were states; that Rome was never a nation tho a state; that ancient Greece was one people, but never a nation or a state; that the United States, altho composed of many states and with many varieties of race, language, religion, and custom, is nevertheless one state, one nation, and one people. To take other examples we speak of the Secretary of State, the national flag, the representatives of the people.

Thus conceiving of the nation, we see that it is a modern growth, and that it must be, because it takes time and implies high civilization and wide-spread liberty to develop a nation. Antiquity knew no nations. Egypt, China, Assyria, did not develop nations. They consisted of a people, or various peoples, ruled over by a monarch. Greece had cities or states, but developed no nation. There was liberty, but no wide-spread union. The Roman Empire was not a nation; it had unity, but its various constituent parts did not have liberty or a common will. The Middle Ages saw no nations tho nationality was growing. England may be said to have developed as a nation almost before the close of the Middle Ages, and France and Italy and Germany were not far behind, yet Italy and Germany were hindered in the development of national unity by division into rival states, and France developed so tyrannical a state as, until the revolution, to have little of the liberty necessary to a true nationality. With freedom and self-government has come that love of country, that common life, which produces the modern nation.

In this brief historical survey attention must be called to the various conceptions of nationality that have prevailed. The Roman people, not a nation in the modern sense of the word, had the word *natio*, but they understood by it what we mean by people. It had an ethnographic base. A people were those descended from a common stock. The law which determined nationality with the Romans was the *jus sanguinis*, the law of blood relationship.

The Germanic tribes, gradually setting up their feudal governments over Western Europe, conceived of the nation as a territorial unit, its people being bound by feudal oaths to allegiance. Commonly the place of birth settled the allegiance, but the allegiance was even more than the birth. Nationality was thus a *jus solis*, or law of the land. This is the law that lies at the basis of the English common law. It is the personal relation of the individual to the sovereign which constitutes nationality. An Englishman is not

Content.

Historical Sketch.

subject to the king because he is an Englishman; he is an Englishman because he is subject to the king. The king being in England hereditary, or perpetual, the oath of allegiance was considered perpetual; nevertheless it came to be recognized in common law that the subject could freely withdraw his person and property from the jurisdiction of the crown, unless expressly prohibited by king or parliament. Yet no law permitting expatriation was passed until 1870. When the United States became independent the relation of allegiance was considered as transferred both to the States and to the national federation. Which allegiance is supreme has long been a mooted point (see CENTRALIZATION), but it may be considered as settled, at least as far as law goes, that the supreme allegiance is to the federal Government.

From this historical résumé and from the conception of nationality itself, it is not hard to see that the nation must play a large part in social reform. Nevertheless, political scientists have been divided between those who would exalt the unity of race and those who would exalt the unity of the nation. Modern socialism on the other hand has been somewhat inclined to ignore both social and national unities, and to develop an internationalism. This is generally the case among European socialists, but English and American socialists have generally and more wisely held that the nation is a natural unit; that if socialism is to be evolutionary it must develop around the national unities of the town, city, state, and nation, and that only when these are somewhat developed can we gradually grow toward a healthy internationalism.

For further consideration of the subject see POLITICAL SCIENCE, STATE, SOVEREIGNTY, etc. For references see STATE.

NATIONAL CHRISTIAN LEAGUE FOR THE PROMOTION OF SOCIAL PURITY, THE, was organized in 1886, largely through the efforts of Mrs. E. B. Grannis, its present president. A national charter was obtained in Washington in October, 1887. Its objects are: To elevate opinion respecting the nature and claims of morality, with its equal obligation upon men and women; to secure a proper, practical recognition of its precepts on the part of the individual, the family, and the nation, and to enlist and organize the efforts of Christians in protective, educational, reformatory, and legislative work in the interest of social purity. It aims to supply employment, funds, and advice to enable needy girls and women to gain an-honorable living. It forms clubs and societies of the young for their training in wholesome and honest intelligence regarding social purity. It endeavors to instill the principles necessary for the prevention of immorality into the minds of young children and youth. It seeks to protect young girls from all forms of temptation, and to prosecute those who deceive them. Its constitution says:

PREAMBLE.

We, a company of Christians, being led, as we believe, by the Spirit of God, do form ourselves into an association for the purpose of engaging in lines of work in the interest of social purity; and for our guidance we adopt the following constitution and by-laws for the purpose of the promotion of social

purity and the general well-being of women and girls, required by the Word of God.

OBJECT.

This society shall strive to elevate opinion respecting the nature and claims of morality, with its equal obligation upon men and women, and to secure a practical recognition of its precepts on the part of the individual, the family, and the nation.

We will enlist and organize the efforts of Christians in preventive, educational, reformatory, and legislative work in the interest of social purity. The lines of work of the association are indicated by its Standing Committees.

CONSTITUTION.

Article I.—The name of this society shall be The National Christian League for the Promotion of Social Purity.

Article II.—Any person who is a Christian believer may be proposed for membership at any meeting of this league, and may be elected at the next regular business meeting. Annual membership fee, \$1; life members, \$50; a life honorary member, without voting privilege, \$10; life patron, \$100; sustaining member, \$25.

Article VI.—There shall be seven, or more, standing committees, as follows:

- I. A Committee on Public, Educational, and Devotional Meetings.
- II. A Committee to Secure Cooperation of Physicians and Medical Colleges.
- III. A Committee on Securing Helpful Legislation.
- IV. A Committee on Schools and Colleges.
- V. A Committee on Reformatory Work.
- VI. A Committee on Woman's Work and Wages.
- VII. A Committee on Amusements.
- VIII. A Committee on Publication and Literature.
- IX. A Committee for Visiting Strangers and those in Need.
- X. A Committee on Ways and Means.

Article XIII.—Auxiliary leagues, or branches, may be established in any city or town by those interested, who may obtain all necessary information for organization from the corresponding secretary.

The league holds two regular meetings each month at its headquarters, 33 East Twenty-second street, New York City: one a prayer and business meeting, the last Saturday afternoon in each month, for women, and a general meeting, composed of both men and women, the last Monday night in each month, for the discussion of the various questions concerning the object and aims of the society, and for stimulating thought along all the lines of the league's labors, in order to prompt individuals to action.

The league has had drafted several bills to be presented before the legislature: bills to prevent the gift or sale of tobacco to minors in prisons; to amend the code so that any person convicted of breaking the Seventh Commandment should be imprisoned for not less than one year, and fined not less than one thousand dollars; to secure long sentences for habitual drunkards and abandoned women, that they may be committed to an industrial home until they shall become self-supporting; to secure full political citizenship for women.

The league has formed permanent homes in the country for its beneficiaries; it has secured temporary homes for a very great variety of exceptional cases; it has given out work for the purpose of keeping families together where it was best that they should not be separated. It has paid rent and board, furnished food, clothes, and shelter to several hundred applicants.

The organ of the league is *The Church Union*, a paper owned and edited by Mrs. Grannis, the league's president.

NATIONAL CITIZENS' INDUSTRIAL ALLIANCE, THE.—This is an organization that aims to do in towns and cities the work of the Farmers' Alliance in the country. The Farmers' Alliance admitting to its membership only persons residing in the country, and there being many persons living in the towns and cities who were in sympathy with the objects of that organization, and desiring to cooperate with it, organizations began to spring up in various places. At Olathe, Kan., at the suggestion of Mr. E. Z. Ernst, a call was made to all citizens who indorsed the St. Louis demands, and on the 9th day of June, 1890, the Citizens' Alliance of Olathe, Kan., was perfected, with Wm. Henry, president, and D. C. Zercher, secretary.

The idea spread, and in a few weeks over 400 similar alliances had been formed, and on August 12 a convention met at Topeka and effected a State organization, with D. C. Zercher, president, and W. F. Rightmire, secretary.

By the end of the year there were 1100 alliances in 19 States, and on January 13, 1891, a convention met at Toledo to form a national organization. The former organization had been open and auxiliary to the Farmers' Alliance, but now an independent organization, with secret work, to be known as the National Assembly of the National Citizens' Industrial Alliance, was instituted, and a constitution, by-laws, and ritual, etc., were adopted, with the election of national officers.

Thomas W. Gilruth, of Kansas City, Mo., was elected president, and Wm. F. Rightmire, of Topeka, Kan., secretary. For the further history of the movement, see FARMERS' ALLIANCE, PEOPLE'S PARTY, NATIONAL INDUSTRIAL LEGION.

NATIONAL CONFERENCE OF CHARITIES AND CORRECTIONS.—This important institution arose out of a visit of the State Commissioners of Public Charities of Illinois to Madison, Wis., in February, 1872. It was there proposed that a conference of neighboring boards be called; and May 14, 1872, five delegates from Michigan, four from Illinois, and five from Wisconsin, met in Chicago for a two days' conference. Its success was largely due to the efforts of Fred. H. Wines, secretary of the State Board of Illinois, S. D. Hastings, secretary of the board of Wisconsin, and H. H. Giles, president of the board of Wisconsin. Another conference was held at Milwaukee in 1873. In 1874 the Social Science Association (see AMERICAN SOCIAL SCIENCE ASSOCIATION) invited the State boards of all States to send delegates to a conference to be held in New York City, May 19. This meeting was known as the First National Conference of Charities, and similar annual conferences have been held ever since. Down to 1878, however, the conferences were held in connection with the Social Science Association, and that organization was the most prominent. Beginning with 1879, the conference has met as a separate body. The chairman of the First National Conference was J. V. S. Pruyin, president of

the New York board, its secretary, F. B. Sanborn, secretary of the Massachusetts board. According to its present constitution, "the National Conference of Charities exists to discuss the problems of charities and corrections, to discriminate information and promote reforms. It does not formulate platforms." The membership includes all past officers of the conference who have served more than one year; all members of State Boards of Charities, or similar boards; all managers and officers of public or private charitable and correctional institutions; all members of societies for the relief or improvement of the poor, unfortunate, or neglected. The fee is \$2 per year, entitling the member to a copy of the proceedings and other publications of the conference. (The proceedings are now published in an annual volume of some 400 pages.) Others specially interested may be enrolled as members without a vote. The officers are elected annually. The standing committees consist of executive and social committees, and a committee on each subject which it is proposed to discuss at the next conference. In 1894 these committees were on Charity Organization, the Administration of Public and Private Relief, Child-saving Work, Juvenile Reformatories, the Insane, State Boards of Charities, the Feeble-minded, Immigration and Interstate Migration, Sociology in Institutions of Learning, Training-schools for Nurses, Homes for Soldiers and Sailors, Reports from the States. The subjects do not materially vary from year to year, tho the preface to the proceedings of the Twenty-first Conference held in Nashville, in May, 1894, says: "It is perhaps indicative of the spirit of the time, that while there is no chapter devoted to prisons, large space is given to Child-saving and Reformatories. . . . A chapter on the Instructions in Sociology in Institutions of Learning hints at a new department; for this promises to be a subject that will henceforth receive much more attention than it has in the past." Besides the National Conference, some States or groups of States, like New England, hold local conferences. The reports may be ordered of the Treasurer, John M. Glenn, Glenn Building, Baltimore, Md.

NATIONAL COUNCIL OF WOMEN OF THE UNITED STATES, THE.—

The part which the many play in the evolution of each idea is well illustrated in the history of the development of the National and International Councils of Women. Twelve years ago, Elizabeth Cady Stanton (*q. v.*), visiting France and England, suggested holding in Washington, D. C., an international convention of women interested in obtaining the franchise for their sex; recommending this as a peculiarly appropriate method for celebrating the then approaching fortieth anniversary of the first Woman's Rights Convention which was held in Seneca Falls, N. Y. Received into Susan B. Anthony's mind, the idea expanded to that of celebrating the fortieth anniversary by holding an international meeting of all kinds of associations of women—educational, religious, and philan-

thropic, as well as political, as these undoubtedly owed their existence to the work done by the heroines of Seneca Falls forty years before. Passed

Origin.

On to the brain of May Wright Sewall, the idea added to itself the thought of permanence and extension, and, when the time came for the Washington celebration, Mrs. Sewall unfolded to her associates a plan providing for triennial gatherings in council of delegates from women's organizations in the United States, and for a quinquennial council to be composed of delegates from national associations in every part of the world. Meeting with a favorable reception from the representatives then convened at Washington, the enlarged idea was put into definite shape by a committee chosen to prepare formal constitutions for these permanent bodies, and, before the delegates separated, the constitutions were accepted, officers chosen, and the recommendation adopted that the general officers of the National Council should at once issue an address to the women of the United States setting forth the object of the new organization.

Three years later, in 1891, the first National Council of Women of the United States, with seven important national organizations as full members of the body and thirty-one other similar associations represented by fraternal delegates, gathered in Washington, holding a three days' convention of two sessions each, which were attended by hundreds of visitors from every section of the country.

In her opening address, President Frances E. Willard suggested a still further extension of Mrs. Sewall's idea, saying, "I believe we should organize a miniature council in every town and city, confederating these in every State, and instructing the State council to send delegates to the national council. The plan would be to let these delegates form a lower and the heads of the national societies an upper house, whose concurrent vote should be essential to the enunciation of any principle or the adoption of any plan. . . . Locally a woman's council should seek to secure for women admission to all school committees, library associations, hospital and other institutional boards intrusted with the care of defective, dependent, and delinquent classes; also to boards of trustees in schools and colleges and all professional and business associations; also to all college and professional schools that have not yet set before us an open door; and each local council should have the power to call in the united influence of its own State council, or, in special instance, of the national council, if its own influence did not suffice. . . ."

President Willard further advised that the Columbian Exposition should witness the convening of a world's council of women, the invitations to which should naturally be given by the national council and the preparations for which should begin without delay.

Miss Willard's idea was acted upon, and when later the World's Congress Auxiliary to the Columbian Exposition and the Woman's Branch of the same were formed, these bodies found in

the National Council of Women of the United States a most natural and efficient helper for the management of the World's Congress of Representative Women. This meeting convened for seven days (May 15 to May 22, 1893), there being 600 speakers at 108 sessions in a building capable of accommodating 12,000 people. There were 18 countries represented by delegates from 95 organizations of national value, and it is generally admitted by all interested in woman's work that the cause of woman was advanced by this great union meeting to an extent not to be compared with the effect of any previous assemblage of women.

The National Council carries forward by means of committees three special lines of work. It having been decided, at its first regular public meeting in 1891, that the interests of all women are concerned in the proposed nationalizing of the divorce laws of this country, a committee was appointed to act, in the name of the council, in urging the appointment of women to positions upon the board of the National Divorce Reform League, the association which is working to secure Congressional action upon divorce. A Committee on Equal Pay for Equal Work secured the presentation in Congress of a bill providing for this justice toward all women in Government employ, and the council intends to push this bill until the United States Government sets this example to all its citizens. The question of developing a business dress for women which shall leave them freer than the conventional dress, has been taken up by the council and led to the appointment of its Dress Committee. Through this committee, which now consists of some of the most eminent advocates of improved dress for women, the council is seeking to concentrate into definite action the already wide-spread impatience of women with their present trammeling mode of dress—a dress utterly unsuited to the demands of the nineteenth century upon women in all walks of life.

To provide a legitimate bond between individuals and an organization which is, of necessity, precluded from accepting persons into membership, provision was made for "patrons of the council." Any person whose name is acceptable to the executive committee can, by the payment of \$100 into the treasury, become a patron for life. There are nearly one hundred patrons, including men and women prominent in all lines of work.

The main work of the council is to unify the efforts of women in educational, philanthropic, and radical work, and to show to the world what women are doing in all these lines.

Its constitution provides that its regular triennial meetings shall be held at the national capital, and this with a view to influencing national legislation upon the topics most closely affecting the lives of women. Its triennial meeting in 1895 was unique in the history of women's assemblages, taking the form of a congress lasting several weeks, in which representatives of the national associations of women which form the council, in conjunction with the represent-

Lines of Work.

atives from local councils of women (of which a large number have already been formed) discussed matters of special interest to women and formulated judgments upon them which, it is believed, will materially influence public opinion.

The members of the Council are the National American Woman Suffrage Association, National Woman's Christian Temperance Union, National Free Baptists' Woman's Missionary Society, Illinois Industrial School for Girls (National Charter), National Woman's Relief Society, Wimodaughsis, Young Ladies' National Mutual Improvement Association, National Christian League for the Promotion of Social Purity, Universal Peace Union, International Kindergarten Union, Woman's Republican Association of the United States, National Association of Loyal Women of American Liberty, Woman's Foreign Missionary Union of Friends, Woman's Relief Corps, National Association of Women Stenographers, National Council of Jewish Women, National League of Colored Women.

RACHEL FOSTER AVERY.

NATIONAL DIVORCE REFORM LEAGUE, THE, was organized early in 1881 as the New England Divorce Reform League, by various gentlemen, Protestants and Catholics, with Dr. Theodore D. Woolsey as president. It became national in 1885, and then more definitely stated its comprehensive object in the revised constitution in these words: "*To promote an improvement in public sentiment and legislation in the institution of the family, especially as affected by existing evils relating to marriage and divorce.*" Its secretary, from the formation of the society to the present time, has been the Rev. Samuel W. Dike, LL. D., Auburndale, Mass. Of the scope of the society one of its reports says:

A comprehensive view is taken of the special problem before it. Earlier work on marriage, divorce, etc., treated these subjects largely or wholly in isolation from one another, and from other related social problems. The league, on the contrary, has held marriage, polygamy, divorce, chastity, children, woman, etc., to be subjects whose study and practical treatment are closely related parts of the one inclusive problem of the family, and its place and work in the entire social order. It has thus, in a degree, broken away from earlier methods of social reform, and been an acknowledged leader in those of recent years, which demand a basis of carefully ascertained facts, and a scientific apprehension of their broad social relations and interdependence. Concentrated effort, nevertheless, has been the steady aim. Work and money have not been spent on large public meetings, or in extensive publication. The league has rather sought to encourage study and original investigation; to lead to broad and thorough knowledge, and to suggest practical work to those who can best labor in their own respective departments, instead of attempting to make of itself a society for doing other people's work. It has held it to be better to get universities and colleges to teach, disinterested statisticians to investigate, and churches and citizens to propose plans of action, than for the league to do these things in their place.

1. The league proposed and was the chief agency in securing from Congress the means for the well-known Report on Marriage and Divorce in the United States and Europe, and its secretary was constantly consulted in the plan of the investigation and during its execution. This report of Hon. Carroll D. Wright, United States Commissioner of Labor, has been recognized everywhere, in this and foreign countries, as giving the authoritative foundation of fact for all future study and legislation. It has revised or radically changed public opinion upon several important particulars, besides giving a sound basis for action upon others. The corresponding secretary of the league, by request, recently presented suggestions

to the International Statistical Institute for the further development of their systems of official statistics of marriage and divorce by the various foreign countries and our own States. With the cooperation of the statistical officers, he has lately collected the recent statistics of marriage and divorce, bringing those of the report of Mr. Wright down to the latest returns.

2. State legislation. Since the work of the league began, there has been almost an entire cessation of the loose legislation that went on for many years in regard to marriage and divorce. The changes of law in recent years are almost invariably in the direction of reform. Many States have improved their marriage or divorce laws, or both. Divorces have absolutely decreased in three or four States, and in others the rate of increase is less than formerly, while in several marriages are better regulated. A more healthy public opinion is forming and making itself felt.

3. Uniform law has been made the subject of careful study and effective treatment. The favorite popular demand for securing uniformity through an amendment of the Constitution of the United States was neither encouraged nor was its possible future need denied by the league. So many, so complex, and so hidden elements enter into this problem that the league refused to join in the popular clamor and devoted its efforts to pushing on the collection of statistics that would shed light upon it. The result fully justified the course adopted, and public opinion has been radically changed regarding the best course to take at present.

4. Dr. Woolsey had suggested in 1881 cooperative legislation by the States, and Governor Robinson, of Massachusetts, officially recommended it in 1884. New York created the first State Commission on Uniformity. The league in 1890 brought this Commission and the Committee of the American Bar Association together, and the work of the establishment of a sufficient number of State commissions to make the experiment has been carried on in earnest, as the most practicable way to begin the solution of the question. Thirty States already have established these commissions. In the report of their first conference the Commissioners speak of the project as "the most important juristic work undertaken in the United States since the adoption of the Federal Constitution." Their subjects include marriage, divorce, the execution of wills and deeds, notarial certificates, bills and notes, and commercial law generally.

5. Church work has received special attention, in order that it might give the home a larger place in its various activities. This was the aim of the series of articles which the secretary published on the Religious Problem of the Country Town in the *Andover Review*, and which began the definite discussion of that subject, and which he followed with other papers and work upon it. He also devised the Home Department of the Sunday-school and secured its adoption by one of the leading Sunday-school societies. This soon after incorporated with it Dr. Duncan's earlier system of home classes, and has now spread widely over the country, doing a valuable work in awakening the home to its own possibilities, as well as extending the study of the Bible.

Believing, as Germany and France have learned, that the sources of national strength and the best social reform must be fed from the institutions of the higher education, constant and systematic work has been done for a dozen years, chiefly through the lectures in the higher educational institutions, the writings and correspondence of the secretary, designed to awaken an interest in the study of the family and its various problems, and in sociology as a science. The rapid development of this class of studies, which were scarcely known when our work began, and the demand for more of them in all our institutions of learning, and especially of late in the colleges for women, is a matter of great satisfaction to us, who were among the first to enter the field. These aims, methods, and results; the inherent importance of the family itself; the peculiar perils of it amid the ferment of our modern civilization, and its latent resources as a constructive force in social reform and progress, have won for the league the high regard of the best public opinion. Its list of officers and contributors shows this. So does the hearty cooperation of Government officials, scientific men, and libraries; of the faculties of educational institutions, and of writers for the press. Such Englishmen as Mr. Gladstone, Professor Bryce, Sir Alfred Stephen, and Mr. Goldwin Smith have shown their hearty sympathy, and spoken

Propaganda.

Work and Results.

emphatically of its importance. Still more significant is the outspoken or mute appeal of countless sufferers from the evils of a low domestic morality and the growing correspondence and personal conferences of the many educated young men and women whose interest has been aroused, and who are eager to treat social problems intelligently and sanely.

See DIVORCE.

NATIONAL FARMERS' ALLIANCE.
See FARMERS' ALLIANCE.

NATIONAL GRANGE. See GRANGE.

NATIONAL INDUSTRIAL LEGION, THE, was organized at Memphis, Tenn., November 19, 1892, by the National Executive Committee of the People's Party (*q. v.*). In connection with these, 100 leading members of the Farmers' Alliance (*q. v.*) became its charter members. Mr. Paul Van der Voort, its zealous advocate, was elected commander in chief. It is a national organization or league, aiming to establish local, county, and State legions, which may serve as People's Party clubs. It has been officially indorsed five times by the national executive committee of the People's Party and by many State committees, as the only league officially recognized by the People's Party. Its declaration of principles is the planks of the Omaha platform (*q. v.*) of the People's Party as to *Finance, Transportation, and Land*. Its members are required to take the following pledge: "I do hereby pledge my word and sacred honor as an American citizen, that I will support and defend the constitution and laws of the National Industrial Legion of the United States of America, and at all times cast my influence and ballot for the declaration of principles as laid down in the constitution; and that I will always endeavor to defend the life, interest, reputation, and family of all true members of this organization."

All communications should be addressed to Mr. Paul Van der Voort, Omaha, Neb.

NATIONAL LEAGUE FOR THE PROTECTION OF AMERICAN INSTITUTIONS, THE, was incorporated under the laws of the State of New York, December 24, 1889. The general secretary has prepared the following statement of the objects of the organization:

"To secure constitutional and legislative safeguards for the protection of the common-school system and other American institutions, to promote public instruction in harmony with such institutions, and to prevent all sectarian or denominational appropriations of public funds."

The league is absolutely unsectarian and non-partisan in character.

As a means of securing the foregoing objects, the law committee of the league has prepared the following XVI. Amendment to the Constitution of the United States: "No State shall pass any law respecting an establishment of religion, or prohibiting the free exercise thereof, or use its property or credit, or any money raised by taxation, or authorize either to be used for the purpose of founding, maintaining, or aiding, by appropriation, payment for services, expenses, or otherwise, any church, religious denomination, or religious society, or any institution, society, or undertaking which is wholly, or in part, under sectarian or ecclesiastical control."

In pursuance of its work on the above lines the league has vigorously opposed, both in the Fifty-first

and Fifty-second Congresses, the making of sectarian appropriations for Indian education, and has sought to extend the common-school system among the wards of the nation. The national councils, conferences, assemblies, and conventions of the Baptist, Methodist Episcopal, Presbyterian, Protestant Episcopal, and Congregational Churches have, in response to the league's memorials, declared against a further continuance of the practice of receiving subsidies from the National Government for the support of denominational work, and have explicitly indorsed the principles of the XVI. Amendment. The principles of the XVI. Amendment have been adopted by two national conventions, representing the various patriotic American orders, many of which are doing active work and securing the cooperation of more than 1,500,000 voters. Local secretaries have been appointed in about two hundred centers of population, furnishing a medium for extended correspondence and organization. Local leagues have been formed in several cities, and steps are being taken to organize State leagues. Subscribers to the principles and purposes set forth in the above statements, who desire the documents of the National League, may send their name, address, and occupation to the general secretary, James M. King, 1 Madison avenue, New York City.

NATIONAL MUNICIPAL LEAGUE.
See MUNICIPAL REFORM.

NATIONALISM is the name in America given to the economic ideal, pictured in Edward Bellamy's novel, *Looking Backward*, and also to the reform movement that has arisen in connection with this book. Its aim is not indeed to copy the details pictured in *Looking Backward*, but to pass toward a civilization patterned in general after the plan outlined in that book. Says Mr. Bellamy:

"This plan is called Nationalism because it proceeds by the nationalization of industries, including, as minor applications of the same principle, the municipalization and State control of localized businesses.

"Socialism implies the socializing of industry. This may or may not be based upon the national organism, and may or may not imply economic equality. As compared with socialism, Nationalism is a definition not in the sense of opposition or exclusion, but of a precision rendered necessary by a cloud of vague and disputed implications historically attached to the former word."

Nationalists put deep emphasis upon the necessity for *economic equality*. Some socialists do likewise, but some do not. In this respect, and in its starting from a distinctly national basis, lies its difference from socialism.

The Nationalist movement in the United States dates from December 1, 1888, when the first Nationalist club was organized in Boston. The idea of the movement, as well as the name, sprang from a suggestion in Edward Bellamy's novel, *Looking Backward*, the book which describes Boston as the author believes it would be under Nationalism in the year 2000. (See **The Looking Backward**.) A club of **First Club**. business men had been formed the previous autumn,—whose motto was, "Spread the Book"; but finding unexpected success and interest, the Nationalist movement was conceived and the first club organized. The leaders in the movement were Cyrus Willard, Sylvester Baxter, Charles E. Bowers, A. T. Devereux, Edward S. Huntington, Henry W. Austin, Miss Anna Page, and others. Mr. Edward Bellamy, himself, being in correspondence with the movers. The first officers of the first club

were Charles E. Bowers, president; Edward Bellamy, first vice-president; C. F. Willard, secretary. The following declaration of principles was adopted:

"The principle of the Brotherhood of Humanity is one of the eternal truths that govern the world's progress on lines which distinguish human nature from brute nature.

"The principle of competition is simply the application of the brutal law of the survival of the strongest and most cunning.

"Therefore, so long as competition continues to be the ruling factor in our industrial system, the highest development of the individual cannot be reached, the loftiest aims of humanity cannot be realized.

"No truth can avail unless practically applied. Therefore, those who seek the welfare of man must endeavor to suppress the system founded on the brute principle of competition and put in its place another based on the nobler principle of association.

"But in striving to apply this nobler and wiser principle to the complex conditions of modern life, we advocate no sudden or ill-considered changes; we make no war upon individuals; we do not censure those who have accumulated immense fortunes simply by carrying to a logical end the false principle on which business is now based.

"The combinations, trusts, and syndicates of which the people at present complain demonstrate the practicability of our basic principle of association. We merely seek to push this principle a little further and have all industries operated in the interest of all by the nation—the people organized—the organic unity of the whole people.

"The present industrial system proves itself wrong by the immense wrongs it produces; it proves itself absurd by the immense waste of energy and material which is admitted to be its concomitant. Against this system we raise our protest; for the abolition of the slavery it has wrought and would perpetuate, we pledge our best efforts."

In May, 1889, the magazine, *The Nationalist*, was started and continued two years. Great interest was manifested, and clubs were started all over the Union, particularly in California. In January, 1891, Mr. Edward Bellamy started *The New Nation*, a weekly published in the interests of the movement. This continued two years. In January, 1891, the secretary reported 162 clubs.

The movement in certain places early took a political channel. In one electoral district in California in 1890, a Nationalist candidate polled 1000 votes. Rhode Island put out a Nationalist State ticket. Most Nationalists today, however, are working in connection with the People's party (*q. v.*). Bills like the one recently passed in Massachusetts, although with bitter opposition from the gas companies, allowing cities to manufacture their own gas, show the advance of Nationalistic opinion, and the mayors of many cities have recently advocated many similar measures. It is in these ways and in the wide spread of Nationalistic ideas that the real growth of Nationalism must be looked for. As an organized movement Nationalism has not been so successful, most of the clubs having disappeared. A national committee to guide the movement, however, exists, largely under the able lead of Mr. Mason A. Green, Mr. Bellamy's former assistant in *The New Nation*, and meets annually to give a general shape to the movement. Mr. B. Franklin Hunter, at 1100 Pine Street, Philadelphia, maintains a Bureau of Nationalistic Literature. As far as organization, however, is concerned, the main impetus of the Nationalist movement has passed into the Peo-

ple's Party (*q. v.*), which is largely honey-combed with Nationalist ideas, and advocates no small share of the Nationalist program. Mr. Bellamy's novel has had, in this country alone, a sale of some half a million copies, and has everywhere scattered the seeds of Nationalistic thought, which are to-day springing up in a thousand channels.

Edward Bellamy has described the aims of Nationalism as follows:

"We who call ourselves Nationalists, believe that the solution of the industrial and social question is to be found, and is only to be found, in the logical evolution of the idea on which this nation is based, which is that of a union of the people in order to use the collective strength for the common welfare. We consider that this idea has always logically involved, when the time should be ripe, the nationalization of industry with a complete provision for the employment and maintenance of the people. When it shall in this manner have completed its evolution the nation will be, according to the hope and belief of the Nationalists, a great partnership for the general business of supporting and enjoying life, in which all the people shall be equal partners. It will be a universal insurance company, guaranteeing all its members against injustice, oppression, sickness, age, accident, and disability of every sort. It will be a mighty trust, holding the total assets of society—moral, intellectual, and natural—not only for the benefit of the present, but in the interests of future generations and for the ultimate weal of the race, and looking to the ends of the world and the judgment of God. The membership of an individual in this great partnership, with all the rights it implies, will be absolutely fixed by the fact of his birth; the part he plays in its affairs being determined by his faculties and aptitudes.

Principles Described.

"There is nothing essentially new about the project of a society based upon and illustrating brotherly relations and obligations among men. The eventual realization of such a state of affairs has been the dream of humanity in all ages. Men have always acknowledged, even the most unjust, that if, instead of contending with one another for the means of livelihood, human beings could only be induced to unite their powers to secure and share a common welfare, the world would not only be a great deal better and a great deal happier, but likewise a great deal richer than it ever has been.

"Heretofore, however, in the history of mankind the practical obstacles to such a change offered by existing conditions and institutions have been insuperable. It is the claim of Nationalists that these conditions have so changed and are so rapidly changing to-day as to render not only possible, but in the near future probable, a transformation of society which a generation ago it would have been chimerical to expect within any calculable period.

"In view of the present extraordinary business situation, the unprecedented and portentous tendency of capital, the excusably alarmed and exasperated attitude of the masses of the people, we hold it not absurd to say that men now in middle age may live to see the present system give place to that grand industrial partnership of all for all which is the destined and sole possible solution of all labor problems and all social questions.

"The greatest industrial revolution in history—greater by far in its destined consequences than the overthrow of the slave system at the South—is the present tendency to the monopolizing of the field of industry and commerce by the great capitalist organizations. The innumerable small business concerns which used to divide up every industry and trade are enduring a war of extermination at the hands of the great combinations of capital. The business of the people, which used to be in the hands of the people, is passing out of their hands into those of a small number of monopolists. It is in vain that we cry 'Halt!' to this tendency. The economic necessities underlying and compelling the movement toward the consolidation of business are irresistible and beyond the power of legislatures to dam up with any quantity of statutes.

"Americans who think are already beginning to see, and all Americans soon will be forced to see, that there

are only two alternatives before the nation—either it must consent to turn over its industries, its entire business—and that means its social and political liberties as well—to a few hundred billionaires, or it must assume control of them itself; that is to say, it must nationalize them. Plutocracy or Nationalism is the choice which, within a dozen years, at the rate things now are going, the American people will have wholly committed themselves to. Can any one who has faith in the people have any doubt as to what the choice between these alternatives will be?”

The misconceptions of Nationalism are many and obstinate, and numerous objections are based upon them, as well as upon its real and acknowledged features. It is not based upon

the maxim, “From each according to his abilities, to each according

to his needs;” its principle is—

Objections Answered. “From each equally; to each equally.” Nationalists protest that

an equal provision for maintenance does not mean a uniform *mode* of maintenance, or a similar manner of life; and that Nationalism would not discourage individuality or private exertion, but rather promote them by furnishing the best conditions for their existence. They assert that while the strong should support the weak, the industrious should not support the idle. Nationalism does not propose a paternal government, but a cooperative administration for the benefit of equal partners; neither does it seek to realize its ideal by abrupt or revolutionary methods, but by the progressive nationalizing and municipalizing of existing public services and industries. As it is an essential principle of Nationalism that in all departments of public business only the chiefs and heads of departments are to be subject to executive appointment or removal, it is claimed that the process of nationalizing or municipalizing industries would not bring a body of voters under the political control of Government.

In regard to the Nationalist program for introducing their ideas, Mr. Bellamy writes in *The Forum* (March, 1894):

“Revolutions, however peaceful they may be, do not follow prearranged plans, but make channels for themselves of which we may at best predict the general direction and outcome. Meanwhile Nationalists would prepare the way by a step-by-step extension of the public conduct of business, which shall go as fast or as slow as public opinion may determine.

The Nationalist Program.

“In making any industry or service public business, two ends should be kept equally in view, *viz.*: first, the benefit of the public by more cheap, efficient, and honest service or commodities; and second, but as an end in every way equally important, the immediate amelioration of the condition of workers taken over from private into public service. As to the first point, whenever a service or business is taken over to be publicly conducted, it should be managed strictly at cost; that is to say, the service or product should be furnished at the lowest cost that will pay the expense and proper charges of the business. Nationalism contemplates making all production for use and not for profit, and every nationalized business should be a step in that direction by eliminating profit so far as it is concerned.

“As to the improvement in the condition of the workers, which is the other and equal end to be sought in all cases of nationalizing a business, it is enough to say that the State should show itself the model employer. Moderate hours of labor, healthful and safe conditions, with provision for sickness, accident, and old age, and a system for the admission, promotion, and discharge of employees strictly based on merit,

and absolutely exclusive of all capricious personal interference for political or other reasons, should characterize all publicly conducted business from the start. In particular cases, such as the clothing manufacture now so largely carried on by sweaters' slaves, decent wages and conditions might temporarily raise the price of ready-made clothing. If it did, it would only show how necessary it had been to make the business a State monopoly; and we may add that on grounds of humanity, this is one of the first that should be brought under public management.

“As to the general question as to the order in which different branches of business should be nationalized, or (which is the same thing) brought under municipal or State control, ownership, and operation, Nationalists generally agree that chartered businesses of all sorts, which, as holding public franchises, are already quasi-public services, should first receive attention. Under this head come telegraphs and telephones, railroads, both local and general, municipal lighting, water-works, ferries, and the like. The railroads alone employ some 800,000 men, and the employees in the other businesses mentioned may raise that figure to 1,000,000, representing, perhaps, a total population of 4,000,000; certainly a rather big slice of the nation to begin with. These businesses would carry with them others. For example, the railroads are the largest consumers of iron and steel, and national operation of them would naturally carry with it the national operation of the larger part of the iron business. There are about 500,000 iron-workers in the country, implying a population of perhaps 2,000,000 dependent on the industry, and making, with the railroad and other employees and their dependents, some 6,000,000 persons. The same logic would apply to the mining of coal, with which, as carrier and chief consumer, the railroads are as closely identified.

Mr. Bellamy's Argument.

“The necessity of preserving what is left of our forests will soon force all the States to go into the forestry business, which may well be the beginning of public operation of the lumber industry. If our fast vanishing fisheries are to be protected, not merely national supervision, but national operation, will soon be necessary.

“In the field of general business, the trusts and syndicates, which have so largely stimulated the popular demand for Nationalism, have also greatly simplified its progress. Whenever the managers of any department of industry or commerce have, in defiance of law and public interest, formed a monopoly, what is more just and proper than that the people themselves, through their agents, should take up and conduct the business in question at cost? In view of the fact that most of the leading branches of production have now been “syndicated,” it will be seen that this suggestion, fully carried out, would go far toward completing the plan of nationalization.

“Meanwhile the same process would be going on upon other lines. Foreign governments which have large armies, in order to secure quality and cheapness, usually manufacture their soldiers' clothing, rations, and various supplies in government factories. The British Government, which is most like our own, was forced, by the swindling of contractors, to go into making clothing for the soldiers in the Crimean War, and has since kept it up with most admirable results. If our Government had manufactured the soldiers' supplies in the Civil War it would have saved a vast sum of money. It is highly desirable that it should forthwith begin to manufacture clothing and other necessaries for its soldiers and sailors, and for any other of its employees who might choose to be so served, as it is easy to say all would; for goods as represented, proof against adulteration, and furnished at cost, would be a godsend even to the millionaire in these days of knavish trade. The policy of supplying the needs of government employees with the product of publicly conducted industries would bring about the whole productive and distributive plan of Nationalism in proportion as the number of employees increased.

“Among special lines of business, which ought at once to be brought under public management, are the liquor traffic and fire and life insurance. It is proposed that every State should immediately monopolize the liquor traffic within its borders, and open places of sale in such localities as desire them. The liquors should be sold at cost,—that is to say, at rates to pay all expenses of the system,—by State agents, whose compensation should be fixed without relation, direct or indirect, to the amount of sales. This plan

would eliminate desire of profit as a motive to stimulate sales, would insure a strict regard to all conditions and requirements of the law, and would guarantee pure liquors. Pending the nationalization of the manufacture of liquors, the General Government need be called on only for a transportation law protecting the States against illegal deliveries within their borders.

"As to State life and fire insurance, this undertaking would need no plant and no backing save the State's credit on long-tested calculations of risks. It would be done at cost, in State buildings, by low-salaried officials, and without any sort of competitive or advertising expenses. This would mean a saving to fire insurers of at least 25 per cent. in premiums, and of at least 50 per cent. to life insurers, and would, above all, give insurance that was not itself in need of being reinsured.

"When private plants are taken over by a city, State, or nation, they should, of course, be paid for; the basis of valuation being the present cost of a plant of equal utility. Of course this subject of compensation should be considered in view of the fact that the ultimate effect of Nationalism will be the extinction of all economic superiorities, however derived.

"The organization of the unemployed on a basis of State supervised cooperation is an urgent undertaking, in line with the program of Nationalism. The unemployed represent a labor force which only lacks organization to be abundantly self-sustaining. It is the duty and interest of the State to so organize the unemployed, according to their several trades and aptitudes,—the women workers as well as the men,—that their support shall be provided for out of their own product, which should not go upon the market for sale, but be wholly consumed within the circle of the producers, thus in no way deranging outside prices or wages. This plan contemplates the unemployed problem as being a permanent one, with periods of special aggravation, and as therefore demanding for solution a permanent and elastic provision for a circle of production and consumption complete in itself and independent of the commercial system. There is no other method for dealing with the unemployed problem which does not mock it.

"In proportion as the industries, commerce, and general business of the country are publicly organized, the sources of the power and means of the growth of the plutocracy, which depend upon the control and revenues of industry, will be undermined and cut off. In the same measure, obviously, the regulation of the employment of the people and the means of providing for their maintenance will pass under their collective control. To complete the plan of Nationalism, by carrying out its guaranty of equal maintenance to all, with employment according to fitness, will require only a process of systematization and equalizing of conditions under an already unified administration."

REVISED BY EDWARD BELLAMY.

References: *Looking Backward*, by Edward Bellamy, Houghton, Mifflin & Co., 1887; *The Program of the Nationalists*, by Edward Bellamy, reprinted from *The Forum* for March, 1894; *Principles and Purposes of Nationalism*, an address by Edward Bellamy, delivered in Tremont Temple, Boston, December 19, 1889.

NATIONALIZATION OF THE LIQUOR TRAFFIC.—It has been proposed by the Nationalists in America (see NATIONALISM) to meet the admittedly enormous evils of the liquor traffic by putting the whole traffic into the hands of the Government and having liquor sold under strict regulations, by government officials, in government dispensaries, and at cost. It is in this last respect that the Nationalist plan differs radically from the Dispensary system (*q. v.*), from the Norwegian system (*q. v.*), and from all similar plans. All these plans provide for some one's making a profit from the sale of liquor. Nationalists, on the other hand, maintain that so long as there is a profit in the liquor traffic some

one will be interested in the extension of the traffic, and that, conversely, the one way to kill the traffic is to kill the profits in it. They argue that this applies to government sales as well as to private sales. It will not do, they affirm, to allow even the Government to make any profits out of liquor, for if the Government has "an interest" in the sales, it will lead to corruption. Officials would then be interested in some way to extend the traffic, so that either strict regulations would not be passed, or, if passed, would not be enforced. If, on the other hand, Government made no profit out of the sales, it would be nobody's interest to sell, and therefore the strictest regulations concerning its sale could be both enacted and enforced. Sales could then be restricted to very limited hours; they could be made only to registered people or hotel guests, so that men could neither buy much at one place nor go from place to place and get a little. They could be absolutely prohibited to minors, to people whom physicians or their families declared unable to drink in moderation, etc. Yet the plan would allow other adults to drink in moderation who wish to do so. This, Nationalists urge, is the best law that can to-day be enforced. Prohibition (*q. v.*) they declare to be, in our large cities and even in most States, at present impracticable. The sale of liquor by government dispensaries, they claim, in South Carolina, Sweden, etc., is already proving practical, and the best way to restrict the traffic, and abolish its grossest evils. Only the Nationalists would go one step further and prevent even Government from having any interest in the concern. To sell liquor at cost, the Nationalists claim, would not induce people to drink more, by making liquor cheaper; in the first place, because it is by no means clear that liquor would be cheaper. The cheaper forms of liquor are sold in such vast quantities to-day, and with such vile adulterations, that they can be sold very cheap, and at such a low margin of profit (the total sum of the profits, however, being enormous) that it is very doubtful if the Government could sell its limited quantities, which would be free from cheap adulterations, at any less price than to-day, and yet cover the cost. Cost price, therefore, would not necessarily be a lower price. Even if the price were slightly lower, the Nationalists urge that the small difference would scarcely increase temptation at all, because few, if any, except those wholly without money, are deterred from drink by the price. Again, government sales of liquors to registered persons would check all or almost all the treating that is to-day one of the greatest forms of the evil. The great argument for this system is, however, that it would at once cut off the enormous money interest in the liquor traffic which to-day buys legislatures, corrupts politics, demoralizes the community, prevents temperance legislation, or mocks its enforcement.

Mr. George W. Evans, writing in *The Nationalist* for December, 1889, describes the Nationalist plan as follows:

Objections Considered.

"National prohibition is Utopian; and whenever we are in a position to secure it, the nuisance can be disposed of with less effort; will, in fact, have already sunk into insignificance. The difficulty that underlies all our schemes of reform is that both parties to the sale of a drink of liquor are co-conspirators. The seller wants to sell because he makes a profit; the buyer will not give evidence against him for any violations of law, because that violation contributes to his own gratification. The desire of profit stimulates adulteration and illicit sales; and lack of evidence has forced the law and order leagues of Eastern cities to such devices that their witnesses are rebuked from the bench in open court, and bid fair to become proverbial for sneaking and treachery—questionable means that nothing can justify if not their end.

"These two things, then, and these only, stand in the way of a reasonable restraint of the liquor traffic: the desire of profit and the privacy of the sale. The first of these difficulties may be obviated by compelling all liquor to be sold at cost; the second, by having all sales entered upon a public record. *This may be accomplished by making the manufacture and sale of liquor a government monopoly like the postal system, and in no other way.*

"Let the Government, then, assume the duty of brewing, distilling, and importing all liquors, and forbid all other brewing, distilling, and importing, just as now it forbids the private carrying of mails; let a suitable number of dispensing offices be established in each ward or other convenient district; at these offices the registered inhabitants or the *bona fide* guests of neighboring hotels may obtain liquor for such purposes and in such quantities as may be legalized; and the stranger within the gates must be vouched for, by the inhabitant with whom he is quartered, in such a way as to prevent any person from obtaining liquor from more than one office.

"There would be nothing immoral about a public bar where the dispenser had no interest except that of efficient public service under wise regulation; and with a moderate and impartial supply of this kind, smuggling and illicit manufacture would be out of the question, because they could not compete with government prices, and the evils that come from adulteration of liquor would disappear. After this system is established, any reasonable restraint will be perfectly effective, and absolute prohibition of the use of alcoholic beverages can be more effectively carried out than it ever has been yet. But this last step might then very fairly be considered an unreasonable restraint.

"Under the present régime the liquor dealers are organized for the protection of their interests against the attacks of society, but there is no organization among them, nor can there be to protect society against the outrages of which it complains. Even if there are some few saloons that will not sell drink after drink to the same customer till he is completely intoxicated, there is no hindrance to the very ordinary and usual practice of going from shop to shop, 'seeing the town,' and getting drunk by degrees. The most conscientious barkeeper—and there may be such—might find it difficult to decide whether the applicant before him could stand another dose of alcohol; and, if the line is drawn too far on the wrong side, the barkeeper will justify himself with the motto of commercial greed: 'It's business.' Not only is the moral responsibility divided by this practice, but the legal responsibility also. The law recognizes the right of the family to protest against the sale of liquor to any of its members whom it may injure; and if the relatives of a drunkard give notice in writing to any particular dealer, there is provision for legal redress if he sells contrary to such notice. It is impossible, however, to give written notice to the hundred saloons within easy walking distance, or to obtain redress, after the notice is served, without evidence of the specific act that constitutes the offense.

"Under the system proposed in this article these evils would not exist. The drinker could get no liquor except where he was known and registered; and, if his case was severe enough to demand it, his family could prevent even that."

On the other hand, the opponents of this system argue that, even if sold at cost, those who manufactured for the Government, or who worked under the Government, if the Government made its own liquor, would have an interest in extending this business;

that they would be tempted to adulterate, and so that all interest in the traffic would not be abolished even by selling at cost, while Government would be corrupted and drinking made respectable and legal. Says a writer in *The Nationalist* for February, 1890, answering the previous writer:

"In Massachusetts, under the prohibition statute of 1855 to 1868, the liquors required for medicinal, chemical, and scientific purposes were obtained at State agencies, and a public record was kept of the sales; all other sales were illegal. If the law had been honestly enforced for a few years, and the agencies placed in honest hands, our annual struggle under local option and license laws would have been avoided; millions of money expended in courts, public institutions, etc., would have been saved, and taxation by this time would have been reduced, as I firmly believe, fully 50 per cent. The Massachusetts method of '55 was far in advance of the beverage plan proposed for the Government to adopt. If we wish to rid the country of the curse of intemperance and the evils arising from the sale of alcoholic beverages, can we do so any more effectually by catering to the bad habits and evil passions of men, through public government dispensaries? We have learned that licensed liquors will ruin a family as quickly as unlicensed, and will not pure alcoholic liquors, if branded 'U. S.,' go to the brain as surely as if doctored and watered by a profits-seeking retailer? In fact, the latter, as compared with a salaried government official, has an interest in weakening the drams and prolonging the walking condition and existence of his customers, and he well knows how to 'extend' his beverages so as to compete with the Government if it should sell the pure article at cost, as proposed. Those who believe that 'there would be nothing immoral about a public bar where the dispenser has no interest,' etc., should have the experiment tried at East Boston, South Boston, or the North End before recommending its adoption throughout the United States."

Nevertheless, the experience of government dispensaries in South Carolina, Sweden, and elsewhere is winning many supporters to the dispensary system, and even many prohibitionists are coming to believe that such a system may be made a step toward national prohibition. The People's Party in Massachusetts and several other States has adopted the Nationalist plan, usually stating it in the following language, which was inserted as a plank in the Massachusetts platform of that party, August 24, 1891:

"We believe that the solution of the liquor problem lies in abolishing the element of profit, which is a source of constant temptation and evil; and we therefore demand that the exclusive importation, manufacture, and sale of all spirituous liquors shall be conducted by the Government or State at cost, through agencies and salaried officials, in such towns and cities as shall apply for such agencies."

This, it is claimed, has the advantage of local option, in that any town or city that votes no license need not apply for a government agency, while any town that desires liquor sold could have it; but only under strictest regulations. (For nationalization in other countries, see SOUTH CAROLINA DISPENSARY SYSTEM.)

NATIONALIZATION OF RAILROADS, THE TELEGRAPH, etc. See RAILROADS, TELEGRAPHS, etc.

NATURALIZATION is an act by which a foreigner, called an alien, becomes a citizen of any country.

The following are the Naturalization Laws of the United States, as prescribed by Sections 2165-74 of the Revised Statutes of the United States:

DECLARATION OF INTENTION.

The alien must declare upon oath before a Circuit or District Court of the United States, or a District or Supreme Court of the Territories, or a Court of Record of any of the States having common law jurisdiction, and a seal and clerk, two years at least prior to his admission, that it is, *bona fide*, his intention to become a citizen of the United States, and to renounce forever all allegiance and fidelity to any foreign prince or State, and particularly to the one of which he may be at the time a citizen or subject.

OATH ON APPLICATION FOR ADMISSION.

He must, at the time of his application to be admitted, declare on oath, before some one of the courts above specified, "that he will support the Constitution of the United States, and that he absolutely and entirely renounces and abjures all allegiance and fidelity to every foreign prince, potentate, State, or sovereignty, and particularly, by name, to the prince, potentate, State, or sovereignty of which he was before a citizen or subject," which proceedings must be recorded by the clerk of the court.

CONDITIONS FOR CITIZENSHIP.

If it shall appear to the satisfaction of the court to which the alien has applied that he has resided continuously within the United States for at least five years, and within the State or Territory where such court is at the time held one year at least; and that during that time "he has behaved as a man of good moral character, attached to the principles of the Constitution of the United States, and well disposed to the good order and happiness of the same," he will be admitted to citizenship.

TITLES OF NOBILITY.

If the applicant has borne any hereditary title or order of nobility, he must make an express renunciation of the same at the time of his application.

SOLDIERS.

Any alien of the age of twenty-one years and upward who has been in the armies of the United States, and has been honorably discharged therefrom, may become a citizen on his petition, without any previous declaration of intention, provided that he has resided in the United States at least one year previous to his application, and is of good moral character. (It is judicially decided that residence of one year in a particular State is not requisite.)

MINORS.

Any alien under the age of twenty-one years who has resided in the United States three years next preceding his arriving at that age, and who has continued to reside therein to the time he may make application to be admitted a citizen thereof, may, after he arrives at the age of twenty-one years, and after he has resided five years within the United States, including the three years of his minority, be admitted a citizen; but he must make a declaration on oath and prove to the satisfaction of the court that for two years next preceding it has been his *bona fide* intention to become a citizen.

CHILDREN OF NATURALIZED CITIZENS.

The children of persons who have been duly naturalized, being under the age of twenty-one years at the time of the naturalization of their parents, shall, if dwelling in the United States, be considered as citizens thereof.

CITIZENS' CHILDREN WHO ARE BORN ABROAD.

The children of persons who now are or have been citizens of the United States are, tho born out of the limits and jurisdiction of the United States, considered as citizens thereof.

CHINESE.

The naturalization of Chinamen is expressly prohibited by Section 14, Chapter 126, Laws of 1882.

PROTECTION ABROAD TO NATURALIZED CITIZENS.

Section 2000 of the Revised Statutes of the United States declares that "all naturalized citizens of the United States while in foreign countries are entitled to and shall receive from this Government the same protection of persons and property which is accorded to native born citizens."

Great frauds have often been committed in large cities by issuing naturalization papers to large numbers of foreigners who, it has been

claimed, have not resided in this country for the requisite term of five years. By this means it has been urged that fraudulent votes have been cast, and elections largely influenced.

NATURAL MONOPOLIES.—This is a phrase that has come into general use, though particularly in the United States, for that class of monopolies which are asserted by the users of the phrase to have become monopolies on account of some inherent property. Professor R. T. Ely, who perhaps has done more than any other writer to give currency to the phrase, says (*Socialism and Social Reform*, pp. 262-300) :

"Monopolies may be divided into two main classes,—natural and artificial; and natural monopolies again may be divided into two sub-classes, namely, First, those businesses which are monopolies by virtue of the qualities inherent in the business itself; and second, those businesses which are monopolies by reason of the fact that the supply of the raw material upon which they are based is so limited in area that the entire supply can be acquired by a single combination of men."

"Natural monopolies of the first class are the natural monopolies ordinarily discussed, and they include the means of communication and transportation; as well as the lighting service by gas or electricity of cities. Railways, water-ways, irrigation works, telegraphs, telephones, are especially important. But street-car lines, whether they are surface lines, subways, or elevated railways, and the means of lighting cities, are scarcely less so. These are all primary businesses in modern society; businesses of every other kind are dependent upon them. . . ."

Characterization.

"Natural monopolies of the second class are those which become monopolies because the supply of raw materials, consisting of natural treasures, is so limited that it can all be acquired by a single combination of men. Anthracite coal has been cited as an illustration; other similar cases could be instanced. It is said that it has been possible to purchase practically the entire supply of some raw materials found among barbarous or semi-barbarous peoples; not so much, perhaps, on account of the limitation of the supply, as on account of the fact that it is easy to cheat them, and to buy, a great supply at far less than its actual value. . . ."

"Land is frequently called a natural monopoly, but this hardly seems correct. Monopoly implies management or ownership by one person, or by a combination of persons who can act as a unit. Anything of the kind does not exist with respect either to landownership, or to the use of the land for agricultural or building purposes. A genuine monopoly in the ownership or exploitation of land would mean the virtual slavery of all persons not interested in the monopoly. If the farmers of the world could act together as a unit, they could force all others to give everything they might have for food, as the alternative would be starvation. 'What will not a man give for his life?' But such a combination is an impossibility, and every attempt to effect a combination, even on a comparatively small scale, with respect to a single staple, like wheat or cotton, has thus far proved a failure."

Mr. Farrer, in his book *The State in its Relation to Trade*, has given the following characteristics of natural monopolies :

- "1. What they supply is a necessary.
- "2. They occupy peculiarly favored spots or lines of land.
- "3. The article or convenience they supply is used at the place where and in connection with the plant or machinery by which it is supplied.
- "4. This article or convenience can in general be largely, if not indefinitely, increased without proportionate increase in plant and capital.
- "5. Certainly and harmonious arrangement, which can only be maintained by unity, are paramount considerations."

The following consideration of the subject we mainly take from various statements by

Professor Ely. Concerning the difference between "natural and other monopolies," he says (*idem*, p. 217):

"Socialists assert that every business is a natural monopoly, and that the expression itself, "natural monopoly," is as much out of place as would be the expression "natural adults," with reference to human beings. Every human being becomes in time an adult, and so, they say, every business becomes in time a monopoly. Proof is sought in a long list of trusts and combinations which have been more or less successful. When we look into this list of trusts in manufactures, however, we quickly ascertain that few of them have achieved anything like complete monopoly; and if we examine the list of unsuccessful attempts to form trusts, we shall discover that this is longer than the list of partially successful trusts. What we ascertain in reality is a demonstration of the advantages of production on a large scale, and a few attempts to secure a monopoly which have been partially successful, and a far larger number of cases of failure to establish monopoly in manufacturing industries. So far as any historical inductive proof is concerned, we must say that it is, as yet, lacking. The careful thinker will at least demand time for further observation. He will tell us to wait and see what tendencies are revealed by subsequent industrial development. If we turn to deductive proof, however, no convincing arguments have been advanced to support the hypothesis, either that unification of manufactures, is, generally speaking, inevitable, or even possible. We must not overlook the immense difficulty of a management so watchful, so alert, so full of resources, so fruitful in initiative and enterprise, that it can permanently secure better results than a number of smaller and competing manufacturers."

As a proof that natural monopolies are such, we are told (*idem*, pp. 263-266):

"The proof that these pursuits are natural monopolies is twofold; namely, deductive and inductive, or historical. The deductive proof takes account of characteristics of businesses of the kind mentioned, and discovers that businesses with these characteristics must necessarily become monopolies. Their main characteristics are three: They occupy peculiarly desirable spots or lines of land; second, the service or commodity which they supply is furnished in connection with the plant itself; and, in the third place, it is possible to increase the supply of the service or commodity indefinitely, without proportionate increase in cost. Any business which has these qualities tends to become a monopoly by virtue of its inherent qualities, and it must become such in time. . . . Inductive or historical proof calls attention to actual experience. It is found that sooner or later attempted competition always gives way to combination and consolidation. The gas business furnishes an excellent illustration, because the experience with respect to this is so super-abundant, and because, furthermore, as the geographical area within which the business is conducted is small, the movement toward monopoly has always been comparatively rapid. Competition in the gas business has been attempted in countries with all kinds of political government, and under every circumstance which can be imagined. It has been tried repeatedly with the most solemn promises on the part of those starting rival companies, that competition would be genuine and permanent. But the nature of the business as monopoly has been strong enough to overcome every obstacle, and guarantees have not been worth the paper on which they have been printed. It is probably not too much to say that competition has been tried a thousand times in different countries, and no one can yet point to one single instance of permanently successful competition. It would seem that a thousand experiments should satisfy any one. The telegraph business also furnishes good illustration. Competition in telegraph service was tried many times in England, but always resulted in monopoly; and it has been tried perhaps a hundred times in the United States, but the tendency to monopoly has been too strong. . . ."

Proof of Natural Monopolies.

"Competition of various sorts has been tried with respect to railways. . . . America will be held to offer the greatest difficulties in the way of the acceptance of a theory of monopoly in the railway business, but the difficulties only spring from the fact that it is a

vast country in which the railway development is yet far from complete. Combination and consolidation are going forward every day, and it is simply a question of time when monopoly will be secured in the United States as well as elsewhere. Even now it would require a small book simply to print the names of railway companies which have been absorbed by other companies, and have ceased to exist."

So conceiving of natural monopolies, those who use the phrase advocate that all natural monopolies should be at least owned and usually (tho not always) operated by the community. Professor Ely writes (*An Introduction to Political Economy*, pp. 252, 253).

"What shall be our policy? Monopoly is inevitable. Private monopoly is odious. Public monopoly is a blessing, and the test of experience approves it. Again and again it has been tried with fear and trembling, but the results have in the long run been gratifying. Public ownership and management of rail-

Treatment.

ways have in Germany succeeded in many respects even better than their advocates anticipated, and the opinion of experts in Germany favors them almost if not quite unanimously. The writer happens to know of no exception. . . . It was long ago said by a shrewd English engineer that where combination is possible competition is impossible. Combination is always possible in the case of undertakings which are natural monopolies. It is inevitable, for it is not only cheaper to do a given amount of business by a monopoly than by two or more concerns, but very much cheaper. If two gas companies in a city, having each a capital of a million dollars, operating separately are able to make 10 per cent. profit, when combined they will make much more than 10 per cent.; possibly even 15 or 20 per cent. There is a force continually at work drawing them together. It works as constantly if not as uniformly as the attraction of gravitation."

This does not, however, according to this school of thought, always imply public operation (*Socialism and Social Reform*, p. 293):

"It does not appear evident at once that the collective management of the property collectively owned is essential. If the anthracite coal-mines were owned by the State or by the nation, satisfactory results might, perhaps, be secured by leasing the land, or by allowing individuals or companies to mine coal freely on the payment of a royalty which would absorb any economic surplus above the normal returns to labor and capital."

Concerning the advantages of the public ownership of natural monopolies, we are told (we quote from various works of Professor Ely) first, that the socialization of natural monopolies would lead to the better utilization of productive forces and the avoidance of wastes due to competition. A railroad manager is quoted as saying that even now it would involve an annual saving of \$200,000,000 if the railways of the United States were managed as a unit. Says Professor Ely (*An Introduction to Political Economy*, p. 254):

"The construction of only two needless parallel lines of railway in the United States, the West Shore and the Nickel Plate, extending together from New York to Chicago, wasted two hundred millions of dollars; a sum sufficient to build two hundred thousand homes for a million people. Probably the waste in railway construction and operation in the United States during the past fifty years would be amply sufficient to build comfortable homes for every man, woman, and child now in the country.

Advantages.

"Every city shows that attempted competition eats up a large part of what might be profit. Gas can well be supplied for a profit in great cities, if the business is a perfect monopoly, for 75 cents."

A second advantage claimed is that it would tend to decrease industrial crises. (See *CRISES*.)

A third advantage is that it would purify politics. (See *CITY*; *MUNICIPALISM*; *SOCIALISM*.)

Fourth, it would tend to the utilization of inventors. (See *COMPETITION*.)

Fifth, it would aid distribution. (See *WEALTH*.) These advantages we consider under their proper heads. But besides these, are indirect advantages perhaps even greater, the breaking up of the great monopolies dependent upon natural monopolies (see *COAL*; *STANDARD OIL MONOPOLY*), and the abolition of railroad favoritism (see *RAILROADS*).

Concerning the purchase of private monopolies, Professor Ely says (*idem*, p. 289):

"The difficulties of payment for these monopolistic undertakings are often mentioned. It must be remembered that public ownership increases their value, because it produces unification in these enterprises, and shuts off the waste of future competition. Frequently public ownership makes it a possibility to unite advantageously several services and thus effect a saving. Very often a municipal electric lighting plant is connected with the public water-works, and results in a better utilization of public property, and of the services of those already in the employment of the municipality. The railways, which include the larger part of the property of the kind under consideration, are generally brought forward as affording the chief illustration of the difficulties of acquisition by the government. The purchase of these practically means the conversion of railway stocks and bonds into government bonds, and while it would add enormously to the public debt, it would add to a still greater extent to the public resources. Besides, it must always be remembered that the change could not be made in a single day.

"Reformers are often inclined to urge that the payments for railways, telegraphs, etc., should only be sufficient to duplicate the existing plant, and this generally means much less than the selling value of the plant. They make a serious mistake in taking this position. As a matter of policy, this course is not to be recommended, because it needlessly antagonizes such a large proportion of the population of the country. Those who are asked to part with their property at a price less than the market value will feel themselves aggrieved, and will oppose the reform in every way in their power. The plan proposed is also objectionable on the score of justice. The value which property of this kind has in excess of the cost of duplication of the plant is largely due to a public policy which has been approved by a majority, and a vast majority, of the people of the United States. A large capitalization, so far as it exceeds the actual value of the plant, very frequently represents only the waste due to attempted competition, and this attempted competition has been encouraged in every way, directly and indirectly, by the general public. Even when such is not the case, the possibility of an excessively large income, which has brought about the large capitalization, has been due to a considerable extent to failures of the legislature to make proper laws, and of the other public authorities adequately to enforce existing laws. Now, if the property is appraised simply at the cost of duplication of the plant, it would make a portion of the community bear the entire burden of a false public policy, whereas, as the whole of the public is to blame, the burden should be diffused among the people as a whole. If it is necessary to raise large sums to pay off the debt necessitated by the acquisition of enterprises of this kind, it could be done through a wisely devised system of inheritance taxes.

"When we consider the difficulties in the way of the socialization of natural monopolies, we must always remember what the alternative is. These difficulties are real, but the difficulties of the present system are even greater."

For the ways in which socialists and nationalists would obtain the ownership of private monopolies, see *RAILROADS*, section *Nationalization of*. We are here considering simply

the views of those who believe in the socialization of "natural monopolies" alone. For examples of the practical working of the socialization of national monopolies, see *BERLIN*; *BIRMINGHAM*; *GLASGOW*; *LONDON*; *ELECTRICITY*; *GAS*; *POSTAL SYSTEM*; *RAILROADS*; *STREET RAILWAYS*; *TELEGRAPHS*; *TELEPHONES*; *POSTAL SAVINGS BANKS*, etc., etc. Professor Ely says (*idem*):

"The test of experience seems to be decisive. The same objections which we now hear against the nationalization of railways in the United States were heard fifteen years ago in Prussia, and the opinion of the people was divided. Now one who travels in Germany, and talks with the people, finds it difficult to discover any one adverse to public ownership and management of the railways. There are some who would like to go back to the old system; but they are few indeed, and they are very generally those who would be apt to derive some private advantage from the change. Professor Cohn of the University of Göttingen voices a general sentiment when he says that, in Prussia, the question of state ownership and management of railways has been settled by the test of experience. The people of the Australasian colonies are equally clear in regard to the advantage of public ownership and operation of railways. There is considerable enthusiasm in regard to the results of such ownership and operation in New Zealand; and recently the editor of an economic periodical complained because he could not find any one in Australia to write an article adverse to the government ownership and management of railways."

Experience.

For the views of those who oppose the socialization of national monopolies, see *INDIVIDUALISM*; *MONOPOLIES*.

Shaw's *Municipal Government in Great Britain* (The Century Co., 1895); John R. Commons' *Distribution of Wealth*, (Macmillan, 1894). (See also *ELECTRICITY*; *GAS*; *RAILROADS*; *SOCIALISM*, etc.)

NATURAL RIGHTS may be, in general, defined as rights or asserted rights based on what are declared to be laws of nature, as distinguished from rights grounded on conventional relations or positive enactments. The phrase, however, is used by different writers and different schools of thought in such different meanings, or shades of meaning, that one must ask the exact sense in which a writer uses the phrase before one can be sure that he understands his exact thought. The use of the phrase, and the value of the ideas embodied in it, will be best seen in following the development of the theory of natural rights through its several phases. Popularly identified with the revolutionary political writers of the eighteenth century, and particularly with Rousseau, the theory is really as old as political thinking and by no means dead to-day.

The germs of the theory may be found in the Greek sophists and particularly in Aristotle, although, as Professor Ritchie has pointed out in his latest book, *Natural Rights*, Aristotle did not hold the theory usually held to-day by those who use the phrase. He speaks of νόμος ἴδιος and νόμος κοινός, meaning by the former any law which the State establishes for itself, and is therefore peculiar to it, and by the latter, the law which is conformable to the dictates of nature and appears to be recognized among all men (*Ethics*, book v. chaps. vi., vii.; *Rhetoric*, book i. chaps. x., xiii.). Aristotle's distinction is not between laws based upon nature and

Classic
View.

laws based upon human enactments. To Aristotle, as to all the Greeks, the State was a natural product. He simply distinguishes between laws peculiar to one State and universal laws common to all.

Some of the Greek Cynics, however, held a theory more close to the modern doctrine. Antisthenes says: "The wise man will live not according to the established laws, but according to the law of virtue" (quoted by Ritchie, *idem*, p. 33). Diogenes was more extreme. He disowned the State and considered himself "a citizen of the world." He opposed all conventions, and preferred his tub to a house. From this Cynic school came the more balanced Stoic, with its maxim, "Live in harmony with nature." Nature, however, is not the whim of the individual; it is the divine element in the universe, and human laws may themselves be a manifestation of it. In Rome, Cicero popularized this view. "Universal consent is the voice of nature" (*Tusc.*, xv, § 35). Hence, the Latin *jus gentium* and the *jus civile* are to be interpreted as almost exact translation of the Greek κοινός νόμος and ἴδιος νόμος. One great jurist Ulpian held that the *jus naturalis* applied to animals as well as men: "It is that which nature has taught to all animals" (embodied in Justinian's *Institutes*, i, tit. 2). From the Roman law the distinction passed into medieval thought. Aquinas' conception of nature was derived from Aristotle, but he adds Cicero's conception of the

Medieval.

lex natura. The natural law becomes a fixed law implanted in the human heart and in the universe, as contrasted with both the laws of men and the revealed law of God. Aquinas says, "Natural law is nothing else than the participation in the eternal law of the mind of a rational creature" (*Summa* Ia, 2ae, qu. 94, art. 2). Medieval thought made a sharper distinction than the Roman jurists between the *jus civile* and the *jus gentium*. When Justinian codified the civil law, the law of nations was more sharply distinguishable from it. It became a distinct ideal code. To it men could appeal. First the authority of human law was questioned by the appeal to the Church. When the authority of the Church was shaken, the way was cleared, says Ritchie (*idem*, p. 42), "for revolution in the name of nature."

Through Grotius and Puffendorf the medieval distinction came to Locke, and with him played an important part. It lies in the background of all his theories. He says

Locke.

(*Treatise on Civil Government*, ii, § 95): "Men being by nature all free, equal, and independent, no one can be put out of this estate and subjected to the

political power of another without his own consent." He talks of a "state of nature," "a golden age" which has "a law of nature to govern it" (*Civil Government*, ii, § 6). Civil society with Locke is constituted by a compact of the original members; a compact renewed from generation to generation in the person of every citizen when he comes to an age of discretion to choose his allegiance. The sovereignty of society is limited, too, to the ends for which it was conferred. It is not hard to see outlined here all the essentials of Rousseau's social compact. Locke from this basis justified the revolution of 1688. Another English writer from the same principles deduced a condemnation of rebellion. Hobbes, like Locke, starts out from a state of nature. Men are by nature equal and live in a state of mutual fear, enmity, and war. This is intolerable. Hence, by a law of reason which is also "a law of nature," they mutually agree to surrender their natural rights to some sovereign man or body of men to govern over them. Hence, having surrendered their natural rights, they no longer have them, but must obey the sovereign power. From these English theorists sprang alike Rousseau's social contract and the "unalienable rights" spoken of in the American Declaration of Independence. Professor Ritchie has shown that the American "inalienable rights" came not from France, as is usually thought, but from England. A bill or declaration of rights exactly analogous to the French declaration is found in most of the State constitutions of the United States originated after 1776, while the French Declaration of the Rights of Man was promulgated in 1791.

America.

The Bill of Rights of Virginia (June 12, 1776) declares, "That all men are by nature equally free and independent and have certain inherent rights, of which, when they enter into a state of society, they cannot by any compact deprive or divest their poster-

ity; namely, the enjoyment of life and liberty, with the means of acquiring and possessing property, and pursuing and obtaining happiness and safety. That all power is vested in, and consequently derived from the people, that magistrates are their trustees and servants and at all times amenable to them." The Declaration of Independence of the United States, signed only a few days later, almost repeats the words, when it says: "We hold these truths to be self-evident: that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness; that, to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed."

This theory was in the air—American and English air as truly as Gallic. Virginia, says Bancroft, "moved from charters and custom to primal principles; from a narrow alteration about facts to the contemplation of immutable truths. She summoned the eternal laws of man's being to protest against all tyranny" (*History of the United States*, 5 ed. viii, p. 383). These metaphysics we have traced historically through Locke. But as Professor Ritchie says (*idem* p. 6), "the theory of natural rights was not Locke's invention. Neither he nor Jean Jacques can claim the credit of having 'discovered the lost title-deeds of the human race.' The theory of natural rights is simply the logical outgrowth of the Protestant revolt against the authority of tradition, the logical outgrowth of the Protestant appeal to private judgment." In the Middle Ages privileges were claimed because of some real or fancied authority in the past. There were three great authorities, the Bible, Aristotle, and Justinian. Yet in each of these could be found some elements of the law of nature. The Levelers appealed to the law of nature. Thomas Edwards (in his *Gangrana*, pt. iii, p. 16) says these "sectaries" held that "by natural birth all men are equally and alike born to like propriety [property] liberty, and freedom; and as we are delivered of God by the hand of nature into this world, every one with a natural innate freedom and propriety, even so we are to live every one equally and alike, to enjoy his birth-right and privilege." Again Edwards says of them (*idem*, p. 20), "though the laws and customs of a kingdom be never so plain and clear against their ways, yet they will not submit, but cry out for natural rights derived from Adam and right reason." This doctrine Ritchie traces back to Wyclif and his poor priests. Wyclif argued (see *De Civili Dominio*, edited by R. L. Poole, *pref.* pp. xxii-xxiv) that "every one in a state of grace has real lordship over the whole universe," and deduces from this community of property. He held this only of the saints, but John Ball (*q. v.*) and others popularized this when they sang:

Protestant-ism.

"When Adam dalf and Evè span,
Who was then the gentleman?"

Says Ritchie, "In the Puritan Revolution of the seventeenth century, the appeal to historic right was replaced by an appeal to natural rights. The struggle for parliamentary liberties led some men to go behind parliaments and charters, just as the independent study of the Bible led some men to go behind the authority of the Bible and to rely on the authority of 'the inner light' alone. This," Ritchie continues, "is the logical outcome of Protestantism, however unacceptable to the majority of those calling themselves Protestants; however unsatisfactory and dangerous in the eyes of those who were more influenced by the historic spirit and who realized, in more or less intelligent fashion, the necessity of social cohesion and continuity." Ireton (*Clarke Papers*, i, p. 307) complains to Protestant extremists, "If you do, paramount to all constitutions, hold up this law of nature, I would fain have any man show me where you will end." Puritan England thus produced the theory, but it was developed mainly in the American Bills of Rights and the French Revolution. The convention at New York, October, 1765, while protesting loyalty to King George, declared "that trial by jury is the inherent right and invaluable right of every British subject in these colonies," entirely in the spirit of the English Bill of Rights of 1689. In the Declaration of Rights of the Philadelphia congress of 1774, appeal is made not only to "the principles of the English constitution and the several charters or compacts," but to "the immutable laws of nature," including the right "to life, liberty, and property." In the declaration of July 4,

1776, no more is said of the rights of British subjects, but we have "unalienable rights," which come from God. We now understand the development of the theory in France better. It did not take, even here, an invariably atheistic form. The French declarations of

France.

1791 and 1793 are proclaimed "in the presence of the Supreme Being." Nor is the theory in France by any means peculiar to Rousseau. It is common to almost all the eighteenth-century writers and largely traceable to English philosophy, appearing through Diderot and the Encyclopedists. All the tendencies of the time—religious, scientific, philosophical, and political—favored the theory. It was developed on its religious side not only by the individualism of the Reformation, in the doctrines of the right of private judgment and Luther's salvation by faith, but quite as much by Calvin's sovereignty of God, since, by making man the predestined subject of God's omnipotent rule, the individual is placed above all the laws of State or Government. The same exaltation of the individual was developed by the growing spirit of science, discovery, and invention. Men were breaking away from all covenants, theories, and institutions of the past. This was peculiarly true in politics. Instituted law was identified with despotism. It was popular to place above such law the "natural rights of man."

The view was particularly favored by the Physiocrats, who they deduced from it economic rather than political conclusions. Quesnay's *Le Droit Naturel* is a classic of this theory, and begins by laying down the proposition that natural right is "the right which a man has to do the things which are fit for his enjoyment."

It will be seen into what ready soil Rousseau dropped his brilliant words. So far from his being the originator of the theory, it is not even clear that he held it, in its extreme form, in his more careful writings. Professor Ritchie argues that it scarcely appears in his little read *Social Contract* (1762), but has been taken mainly from his more popular, but weaker, *Discourse on the Origin of Inequality among Men* (published 1754). This discourse, however, belonged to Rousseau's most brilliant period, and tho its views seem seriously modified in the later *Social Contract*, its teachings, and not the more careful statements of the latter, have become identified with Rousseau. The theory, however, in its essence, is contained in both books. We present Rousseau's statement as Professor Huxley has summarized it (*Nineteenth Century*, January, 1890), that: First, All men are born free, and politically equal and good, and in the "state of nature" remain so; consequently, it is their natural right to be free, equal, and (presumably their duty to be) good, *Contract Social*, v. pp. 98-99, Mussay Pathay's edition, 1826.

Rousseau.

Second, All men being equal by natural right, none can have any right to encroach on another's equal right. Hence no man can appropriate any part of the common means of subsistence—that is to say, the land or anything which the land produces—without the unanimous consent of all other men. Under any other circumstances, property is usurpation (*Discours*, pp. 257, 258, 276). Third, Political rights, therefore, are based upon contract; the so-called right of conquest is no right, and property which has been acquired by force may rightly be taken away by force (*Discours*, pp. 276-280).

The relation of such theories to the French Revolution it is easy to see. The famous French Declaration of the Rights of Man was proclaimed in 1791, and undoubtedly embodied the principles of the Revolution, altho these principles can by no means be considered to have caused this revolution. The French Revolution simply accomplished suddenly and in bloodshed what England had gained quietly and with legal procedure. Nevertheless, the French Revolution called all men's attention to the dangerous aspects of the theory of natural rights. In England, where the theory had been largely developed, it was strenuously attacked, and with such success that to-day most English and American publicists consider it exploded. That this is not the case we shall later see; but it is true that the overwhelming judgment of modern English and American scholars is against the theory. This is probably mainly due to the development of the modern scientific and historic spirit, which asks for

Criticism.

induction from facts, not for brilliant generalities from metaphysical arguments about unproven and unprovable "natural laws." The theory, how-

ever, was first attacked by statesmen and philosophers rather than by scientists. In brilliant rhetoric Burke argued its dangerous and baseless nature. Paine, in his even more brilliant and rhetorical *Rights of Man*, answers Burke; but thought and, above all, science, were to answer Paine. Bentham more coldly argued its uselessness, and then science came to condemn it and ask what facts teach, not what different people assert to be "natural." The argument against it to-day is mainly based on the fact that nobody can prove what are natural rights. Modern disbelievers in the theory assert that what are called "natural rights" are simply what various men believe to be the ideal of what should be man's social status. Says Professor Ritchie (*idem*, p. 80), "Natural Rights, when alleged by the would-be reformer, mean those rights which, in his opinion, would be recognized by the public opinion of such a society as he admires. . . . They are the rights which he thinks ought to be recognized; i. e., they are the rights sanctioned by his ideal society, whatever that may be." Further, Professor Ritchie says (*idem*, p. 82), "If we go back to the ordinary unreflecting opinions of mankind in comparatively primitive conditions, we shall find that those rights which people think they ought to have, are just those rights which they have been accustomed to have, or which they have a tradition (whether true or false) of having once possessed. Thus to the average Greek, slavery undoubtedly seemed a 'natural' institution; it was familiar to him, and he did not know of any civilized society without it. . . . A Turk, a German, an American, would give somewhat different accounts of this natural status. The 'natural' in each case may, perhaps, be pitched a little above the average usage of the society in question; it represents the expectations of the society, of which expectations fulfillment may indeed fall short." Hence, as many modern thinkers have shown, the theory of "natural rights" may be made to support any theory. It is usually used to base an argument against any law or action of the State that the individual does not consider wise or right. It is used by anarchists to condemn existing inequalities of social conditions, and by conservatives to check attempts on the part of government to remedy those inequalities. The Liberty and Property Defense League plants itself on the same natural rights as did Tom Paine. In the name of natural rights Henry George argues that every man has a right to what he produces, and only to that, while Matthew Arnold says: "An author has no natural right to a property in his production. But, then, neither has he a natural right to anything whatever which he may produce or acquire" (*Fortnightly Review*, vol. xxvii, p. 322). Such contradictions prove to the critics of the theory its impracticability, baselessness, and unreality.

Says Jevons in *The State in Relation to Labor*: "The first step must be to rid our minds of the idea that there are any such things in social matters as abstract ideas." Mr. Spencer quotes a writer "of high repute" as saying "to explain once more that there is no such thing as 'natural right' would be a waste of philosophy." Rousseau himself, in the preface to his *Discours*, says: "It is more difficult than one would suppose to take the precautions necessary to basing an argument upon it [the doctrine of natural rights]." Professor Huxley shows that nature's laws "contain in reality nothing but a statement of that which a given being tends to do under the circumstances of its existence." A tiger has a natural inclination to eat men; certain cannibals are said to have the same inclination. Have they a natural right to eat men? As used against governments, the advocates of "natural rights" and "a state of nature," which is supposed to be better than the organized state, forget what Aristotle did not forget, that the State itself is natural. It is halting metaphysics and stranger theology to assert that God made the country and man made the city. Is the plowed land unnatural? Is the city street contrary to human nature? The view held to-day by most publicists, in place of the theory of natural rights, is stated by Professor John W. Burgess, as follows:

"The revolutionists of the eighteenth century said that individual liberty was a natural right; that it belonged to the individual as a human being, without regard to the state or society in which, or the government under which, he lived. But it is easy to see that this view is utterly impracticable and barren; for if neither the State, nor the society, nor the government defines the sphere of individual autonomy and con-

The Opposing View.

structs its boundaries, then the individual himself will be left to do these things, and that is anarchy pure and simple. The experience of the French Revolution, where this theory of natural rights was carried into practice, showed the necessity of this result. These experiences drove the more pious minds of this period to formulate the proposition that God is the source of individual liberty. *Dieu et mon droit* was the medieval motto made new again. But who shall interpret the will of God in regard to individual liberty? If the individual interprets it for himself, then the same anarchic result as before will follow. If the State or the Church or the government interprets it, then the individual practically gives up the divine source of his liberty. . . . We may express the most modern principle as follows: The individual, both for his own highest development and the highest welfare of the society and State in which he lives, should act freely within a certain sphere: the impulse to such action is a universal quality of human nature; but the State, the ultimate sovereign, is alone able to define the elements of individual liberty, limit its scope, and protect its enjoyment. The individual is thus defended in this sphere against the Government by the power that makes and maintains and can destroy the Government, and by the same power *through* the Government against encroachments from every other quarter. Against that power itself, however, he has no defense. It can give and it can take away. The individual may ask for liberties which it has not granted, and even prove to the satisfaction of the general consciousness that he ought to have them; but until it grants them, he certainly has them not. The ultimate sovereignty, the State, cannot be limited, either by individual liberty or governmental powers; and this it would be if individual liberty had its source outside of the State. This is the only view which can reconcile liberty with law, and preserve both in proper balance. Every other view sacrifices the one to the other" (*Political Science and Constitutional Law*, vol. i. book ii. chap. i.).

Such is the ordinary view held at present by the large majority of thinkers in England and the United States.

Yet there are a few and some of the most brilliant minds in England and America, and a whole school of thinkers upon the continent of Europe, who do hold still to the doctrine of natural rights. Herbert Spencer has given the weight of his name to the doctrine. In his *Social Statics* he holds that all rights are derived from a single first principle, which he calls "the law of equal freedom." This principle is "that every man may claim the fullest liberty to exercise his faculties compatible with the exercise of like liberty by every other man" (chap. v. § 3), or, as he elsewhere expresses it, "every man has freedom to do all that he wills, provided that he infringes not the equal freedom of any other man" (chap. vi. § 1). Accordingly, he says: "Rights are nothing but artificial divisions of the general claim to exercise the faculties—applications of that general claim to particular cases; and each of them is proved in the same way by showing that the particular exercise of the faculties referred to is possible without preventing the like exercise of faculties by other persons." His development of this theory is well known. (See SPENCER.)

In Germany, the idea of *Naturrecht* is the root idea of German jurisprudence. Professor Pollok says of this school, that its authors "throw their main strength on investigating the universal moral and social conditions of government and laws, or, at any rate, civilized government and laws, and expounding what such governments and laws are, or ought to be, so far as determined by conformity to these conditions." English writers, he says, are apt to despair of systems of philosophy built up on somebody's conception of "things as they ought to be," "necessary inferences from the facts of nature," "natural laws" which, nevertheless, "never have been and probably never will be perfectly discovered. But," he adds, "allowance must be made for difference in meaning. We may discover this mysterious and terrible *Naturrecht* to be no worse than a theory of government and legislation; or, to preserve better the wide generality given to it by its authors, a kind of teleology of the State and its institutions."

In England Professor Lorimer in his *Institutes of Law*, with its sub-title, *A Treatise of the Principles of Jurisprudence as Determined by Nature*, most nearly represents the German school. But the characteristic modern English, and especially the American use of the theory, is the use made of it in politics by Jeffersonian Democrats, with their strict limitation of the

power of the State, and in economics by Henry George and his followers, when they hold that each man has a natural and a divine right to what he produces, and to that only, so that land values should be held in common, since no individual has produced them, but that each individual should be allowed private property in other things. (See SINGLE TAX.) Professor Ritchie, in his volume above referred to, considers the specific natural rights most commonly claimed: the right of life, of liberty, of toleration, of public meeting and association, of contract, of resistance to oppression, of equality, of property, of pursuing and obtaining happiness. He shows, however, that nations like the United States, most imbued with the theory of natural rights, have not scrupled to go contrary to them when it was popular. Protestants, who cannot understand why Roman Catholics should not allow legal divorce, are quite ready to suppress Mormon plural marriages by law. To sum up, the theory of natural rights is considered by its critics vague and useless; its truth to lie in its witness to the belief in a divine or general ideal of society toward which men are ever pressing.

NEGRO AND PRESENT SOCIAL REFORM, IN AMERICA, THE. (See also SLAVERY.) During the dark days of slavery little or no progress could be expected from the negro. Bought and sold like the cattle of the fields, and bearing all the degrading consequences of an inhuman bondage, it is evermore to his credit that he has escaped at all from the brutalizing influences of 260 years. There was a large number of free negroes settled in the South before the war, and altho they were allowed to acquire property, and secure a measure of education, they were subject to many disabilities and restrictions. They were denied intercourse with the slaves; and were even frequently the victims of murderous mobs who violated the seclusion of their homes. They were, in both North and South, excluded from the militia, and quite generally denied the right to vote, altho impartially taxed. Their schools were separate, few in number, and poorly conducted. They were excluded from churches, confined to the galleries of theaters, denied lodging and board at hotels, and were not permitted to travel as first-class passengers upon either land or water. Nearly every State constitution contained the word "white" as a restriction of civil rights; nearly every common-carrier company had special rules to apply to the negro; and nearly every community contained men and women who were always ready to denounce and abuse the harmless and submissive blacks. If the noblest class of Americans were subjected for years to such disadvantages as these, and with no chance of revolution or redress, it is very probable that their social and moral condition would not finally be very high.

The great bravery shown by many negro regiments in the war of the rebellion did much

to elevate them in esteem, and secure a little more fairness in their treatment by the whites. Before the spring of 1863 the United States Government published a plan by which negroes, free and bond, were to be employed as soldiers. By the end of the autumn 50,000 troops of this character were under arms. From the beginning to the close of the war there were 178,975 negro troops in the service of the nation, who participated in 449 engagements and sustained a loss of 36,847. At Fort Wagner, Port Hudson, Chapin's Farm, Nashville, and upon other fields they won the confidence and approval of the military and civil leaders of the cause they so gallantly served. Doubtful and discriminated against in respect to their pay, bounty, and clothing, they were subsequently placed upon the same footing with their more favored white comrades.

On January 1, 1863, the Proclamation of Emancipation was issued; every negro received his freedom; and soon after, by amendments to the Constitution, was made a voter and a citizen. The legislatures of the Southern States, however, passed laws that practically disfranchised him for a time; and the acts regulating negro laborers made them the merest vassals of the soil. But the reorganization of these States brought the negro into political prominence.

During the period of reconstruction negroes were in the majority in the Senate and House of Representatives of some Southern States, while two became United States senators and a dozen were members of the House of Representatives. Fourteen held positions in the diplomatic and consular service of the Government. The United States marshal for the District of Columbia, the tax collector, the recorder of deeds, and the register of the treasury were, at one time, negroes, and all of them ex-slaves save one. There were about 600 negroes in the departments at Washington, D. C., and several thousand of them in the postal, revenue, and customs service in various sections of the country.

The attitude of the Southern people to the negroes since the war has been almost invariably aristocratic and repressive; they have too

The South and the Negro.

frequently endeavored to keep them servile and dependent, instead of aiding them to reach a higher plane of intelligence and citizenship. Henry M. Boies says, in the course of an earnest plea for negro education, "The whole administration of the South proceeds upon the false and un-American idea of a servile class, to be maintained in a condition of suppression; an idea which the welfare of our institutions, society, and government cannot tolerate, and must in some way totally eradicate, abolish, and destroy. The American people and its free government are irrevocably pledged and devoted to human progress, elevation, and civilization, without regard to tribe or tongue, sex or color, or any previous condition of nativity, servitude, or intelligence."

In another place the same author writes: "A ruling white minority, possessing the wealth, stands over a black majority which is

paid for their labor actually less than the fairly comfortable subsistence which they received when slaves; and denies to them every right of equality except the simple name of citizen. This is as hostile to true Americanism as was slavery. It has become so palpable, atrocious, and pregnant a national peril as to require national intervention."

Yet it must be admitted that to this as to every question there are two sides. The Southern whites say, in answer to such criticism, that the negroes are yet too ignorant to vote; that being in some States in the majority, they would, if allowed actual equality with the whites, put back the whole civilization of the South, if not make civilization impossible. Says Governor Evans of South Carolina, in regard to the constitutional convention called to devise a way for excluding the negro from political power :

The Southern View.

"There are only two flags, the white and the black. Under which will you enlist? The one, the white, is the peaceful flag of Anglo-Saxon civilization and progress. The other is the black flag of the debased and ignorant African, with the white traitors who are seeking to marshal the negroes in order to gain political power. . . .

"The constitutional convention must be controlled by white men, not white men with black hearts, not negroes. The world must be shown that we are capable of governing ourselves, and that, constitution or no constitution, law or no law, court or no court, the intelligent white men of South Carolina intend to govern her."

The South (especially the progressive so-called New South) has no desire to reenact slavery, if it could, but it does almost as one man insist that civilization shall not be lowered to the level of the negro—which, it says, would be the result of giving the right at present of political and social equality with the whites.

Suddenly transformed from slaves to citizens, without test or preparation, it is self-evident that the whole negro race is the ward of the American nation, and must be so considered and treated, until it shall rise in all respects to a level of equality with its white fellow-citizens, and have a fairer show in the competitions of life.

"But there are unflinching signs that the negro is accumulating property, and rapidly acquiring knowledge, in spite of the many peculiar obstacles that have been cast in his way. In 1838, in the District of Columbia, where the Government emancipated the slaves by compensating their masters, the negro citizens paid taxes upon about \$8,000,000 of real property; in Georgia they are taxed for about \$11,000,000, in Louisiana for about \$25,000,000; and in other States in an almost proportional amount."

"According to the census of 1890, there are in the United States 7,470,040 persons of African descent—an increase of 13.5 per cent. since 1880. The negro school population of the former slave States is about 2,100,000; and the enrolment is 1,100,000. They have 281 normal schools with 6207 students; 270 institutions for secondary instruction with 9970 students; 238 universities and colleges with 5119 students; 110 schools of theology with 1297 students; 16 law schools with 98 students; 22 schools of medicine, dentistry, and pharmacy with 208 students; 40 schools for the deaf, dumb, and blind with 139 students; and, adding the 661 schools for negroes in the Northern States to the 18,794 for the freedmen, there are 19,455 public schools with a total enrolment for the race, as far as reported, of 1,127,839. This does not include the negroes and mulattoes in the schools of the

Statistics.

North, where no discrimination is made as to color or nationality. There are more signs of improvement in the negro in the South than in the small communities of Northern negroes, who, contented with their condition, make little effort to improve their opportunities. They are the servant class as a rule, altho there are worthy exceptions, and make little or no progress. However, in the larger cities of the Northern States negroes have branched out into lucrative business enterprises, and by industry, frugality, and ability have attained to high and honorable business standing."

In general, since emancipation, their morals are improved, their social life more elevated, their tastes more chaste, their education advanced, and their comfort and happiness infinitely increased. The friends of humanity everywhere will join in creating a public sentiment friendly to the negro as a citizen, as a laborer, and as a man, until the African race is merged at length into a composite American nationality. H. N. C.

Concerning some other statistics in regard to the negro population in the United States, the Rt. Rev. C. Clifton Penick, D. D., agent for the Commission of the Protestant Episcopal Church for work among colored people in the United States of America, says in a tract on the struggles, perils, and hopes of the negroes:

"In 1865 probably not one in ten thousand of the negroes of the South could read. To-day not less than twenty-five thousand are professors or teachers in colleges and schools. A vast number of well-read preachers, lawyers, doctors, mail agents, and clerks are at work, while, in 1800, 1,255,320 scholars were in public schools—18.55 per cent. of the negro population in the entire country, an increase of public-school enrolment of 61.58 per cent. in ten years. The enrolment of white children the country over is but 21.68 per cent. of the white population. When we remember that altho there are but 7,470,000 of these people, they have in twenty-five years built them 19,753 churches, with 5,818,459 seats, at a cost of \$20,323,887; that they report 2,316,785 communicants in churches entirely of their own race, the figures are startling. Rev. H. K. Carrol, compiler of church statistics for the Eleventh Census, puts the number of communicants at 2,610,525. When we contrast, however, the wonderful strides of the race in education and religiousness since 1865, the revelations of its criminal record are both surprising and appalling, as the following facts, gathered from the census of 1890, show:

"The negro population is a little more than one-ninth of the entire population of the nation, yet it furnishes 37 per cent. of its homicides—*i. e.*, 2730 out of 7386. Of the 82,329 adult prisoners in the United States, the negroes give 27,277. Of the 387 female homicides the negroes give 224—*i. e.*, two-thirds. The entire country has one adult criminal to every 786 of its population, while the negroes have one to every 284 of their population. Our 45,912,663 native born whites have one homicide to every 14,539 of them; the foreign whites one to 7633; the negroes one to every 2727. If we compare the ages of the homicides, we find that from 50 to 60 years of age the negroes furnish 115 out of 580, about one-fifth; from 40 to 50, they furnish 289 out of 1148, about one-fourth; from 30 to 40, 714 out of 2152, or about one-third; from 20 to 30, 1,271 out of 2630, nearly one-half; and under 20 years of age, two-thirds of the homicides of the entire nation are recorded as negroes. Of the nine murders committed by youths of 14 years old, eight were recorded against negroes."

NEIGHBORHOOD GILDS is the name of certain social reform institutions first proposed by Dr. Stanton Coit (*q. v.*), as the result of his experience in the social settlements started by him in New York city and London. He embodied his ideas on this subject in a book entitled, *Neighbourhood Guilds*, published in 1891. According to this work (*p. 7*), "The very name, 'neighborhood gild,' suggests the

fundamental idea which this new institution embodies: namely, that, irrespective of religious belief or non-belief, all the people, men, women, or children, in any one street, or any small number of streets in every working-class district in London, shall be organized into a set of clubs, which are by themselves, or in alliance with those of other neighborhoods, to carry out, or induce others to carry out, all the reforms, domestic, industrial, educational, provident, or recreative, which the social ideal demands." Dr. Coit's idea is that the forming of separate societies or clubs for special purposes tends to magnify out of all proportion that one side of life or culture which it aims to develop. It tends again to break up the family unit. It sends the boys to one club, the girls to another, the father to another, the mother to another. Thirdly, it breaks up neighborliness. One family knows nothing about its next-door neighbor, because the two families go to different churches, to different clubs, have different interests. The Neighborhood Gild aims at organizing the social life of all the people in one small district. It thus brings neighbors together, families together, different interests together. In the Neighborhood Gilds there are departments for boys, for girls, for men, for women, for art, for education, for recreation, for the various interests of life; and they are not all separate; for certain purposes, and at certain times, all come together. According to Dr. Coit, no Gild should be so large as to prevent all the members forming a circle of acquaintance. Personal work is its essence. To develop persons in all sides of character is its aim. It would not compete, but rather cooperate with other reform agencies. Neighborhood Gilds can be started quietly, without great initial expense, in almost any place, starting, perhaps, in one family house, its parlors being used for meetings until a room, and then a house, can be hired. Dr. Coit started the first Gild in New York city, about 1885, and it has now grown into a University Settlement (*q. v.*). In 1889, Dr. Coit, on his removal to London, started one there in Kentish Town. For all details, see Dr. Coit's book, *Neighbourhood Guilds*.

NEO-MALTHUSIANISM. See **MALTHUSIANISM**, last section.

NET PROFITS. See **PROFITS**.

NEW AUSTRALIA.—July 16, 1893, 200 emigrants left Australia to found a communistic colony in Paraguay, to be called New Australia; the leader was William Lane. The experiment elicited more attention than most such experiments, but the colony has met with great difficulties. Dissensions early broke out; the colony divided, and at this writing (1895) it is impossible to ascertain its true condition.

NEWCOMB, SIMON, was born in Wallace, Nova Scotia, March 12, 1835. In 1861 he became professor of mathematics in the United

States Naval Observatory at Washington, D. C., and since 1884 has also held a professorship of mathematics in Johns Hopkins University. Among his most popular works are *Popular Astronomy* (1877) and *Principles of Political Economy* (1886). In economics Professor Newcomb is known as an adherent of the classical school. A clear and forcible writer, he is as well represented in numerous magazine articles as in his books, particularly in his articles in the *North American Review* and *Princeton Review*.

NEW HARMONY, though later identified with Robert Owen (*q. v.*), was founded by a small German sect, the followers of one George Rapp, a weaver by trade, but noted for his biblical knowledge and piety. Rapp gathered together in Wurtemberg a number of people who shared his religious views, and, following the example of the early Christians in Jerusalem, they held all their property in common.

"Being persecuted for their views, they decided to emigrate to the United States, and in 1803 the Rappites formed their first settlement in Butler County, Pa., giving to their village the name of Harmony. By dint of hard work and economy, in 10 years they were in a state of comparative comfort; but wishing to make their position more secure, in 1813 they moved westward and bought about 30,000 acres of some of the richest land in Posey County, Indiana, and there founded the world-famous village of New Harmony. The Rappites were a very industrious and inoffensive folk; their creed enjoined pure life, simple diet, and plain dress; the ambitions and wishes of the individual were to be entirely subject to the general good. After a time they took vows of celibacy, even those who were already married dissolving the relationship and taking the vows. For ten years they labored and prospered exceedingly, both in agriculture and manufacture; and then, selling all their land and the village buildings to Mr. Robert Owen, of New Lanark, Scotland, they emigrated east again to Beaver County, Pa., where they founded the village of Economy." (See **ECONOMY**.)

The purchaser of New Harmony, Robert Owen (*q. v.*), was a Welshman, born in 1771. He became manager and then proprietor of extensive cotton mills on the Clyde, Scotland, and devoted much energy to promoting the interest of working people. He desired to abolish all class distinctions, and endeavored to show that the interests of the employer and employees could be made identical. His mills at New Lanark were ideal object lessons to support his theory, and it was to put into practical shape his theories for the advancement of working people that he bought the New Harmony estate. Associated with him in the scheme was a Mr. William Maclure, a Scotchman, who shared Mr. Owen's communist theories.

"Their aim was to establish a community in which property was to be held in common, though under the restriction of a constitution. All were to share in the common labor, and all should receive a liberal education, with facilities for continued study and pursuit of knowledge. The religious views of the members were entirely of their own choice, the only qualifications essential for membership being honesty of purpose, temperance, industry, cleanliness, and carefulness. When the settlement of New Harmony came into the possession of Robert Owen the village was regularly laid out as a town, with streets running at right angles to each other; and in the center a public

square, surrounded by the large brick buildings built by the Rappites for their churches and schools. The land itself was well prepared; there were 10 detached farms, and some 3000 acres which had been cultivated by the Rappite society, besides a vineyard, several orchards, and other improvements. With the place so prepared, and 30,000 acres to fall back upon, the experiment of a secular community, based on honesty of purpose and moral integrity, seemed to have every material advantage that could be offered. In a very short time the village was a busy place. Within two or three months there were some 600 persons gathered from all parts of the United States and Europe. Many of these were inspired with an earnest belief in the ideals which the experiment was to prove, and worked zealously in the endeavor to put them into practice; but many, also, were lazy and shiftless, and came seeking an easy mode of living, shirking their share of the toil, while others came with a view to making profit out of the benevolent feeling of the founder, and with no sympathy at all for the movement. With such material it was quite impossible to fulfil the original expectation, and in less than two years it had become evident that it was hopeless to try longer."

On April 27, 1825, Mr. Owen called all the members of the community together, and in an address explained the impossibility of an immediate total change in all their manners of life, and proposed that they should accept a constitution only partially communistic for a term of three years, that they might be better prepared to fully carry out the ideal community. This was agreed to, and under the name of the **Constitution**.

"Preliminary Society of New Harmony" the venture was formally constituted. Mr. Owen then returned to Europe, and a committee managed the affairs of the society. In less than a year Mr. Owen returned to New Harmony, and soon after his return the members of the Preliminary Society held another convention, deciding to at once commence communism and adopting a constitution of a community which they called the "New Harmony Community of Equality." The management was to be in the hands of an executive council, who were to be subject to the direction of the community. Experience demonstrated that the plan of the executive council was not practicable, and the members were unanimous in requesting Mr. Owen to take the sole management. This was the inauguration of the most prosperous season in the short life of the community. There were soon no idlers, all being busily engaged; and the meetings, instead of being the scene of wrangles, were utilized for the benefit of all the members.

This was too good to last, and within a very few months there were disturbances, and attempts to divide the town into several societies. On May 30, 1826, in consequence of the continual disagreements which had arisen about the disposal of the property, a meeting of the whole of the population was held, at which it was decided to form four separate societies, each to purchase its own share of the property, and each to manage its own affairs, but to trade together by means of paper currency. Other changes followed fast, but each change left them no better than before. The trouble was not in the institutions so much as in the unpreparedness or greed of many of the members; and though there were many choice, noble spirits in the undertaking, they were overweighed by the others. After watching the spirit of the community depart, and his

fondest hopes gradually crumble away, in June, 1827, Mr. Owen bade the community farewell.

Leases were granted to such as desired to continue the cooperative experiments, and tho some smaller communities were formed from the wreckage, the New Harmony Community of Equality had become a thing of the past.

The effect, however, was not to die away. The scheme of communal cooperative life took a deep hold on the imaginations of the people, and many smaller communities were formed; and, when nearly fifteen years later Fourier's scheme was advocated, many were prepared to sink their all in the new communities which sprang up in all directions—and, alas! died away as rapidly as they came into existence. But with all the failures, there is still some gain, and the bitter disappointments of those who fondly imagined they were remodeling society are only the defeats which will help to insure victory later on, even tho it should not come as they expected it. A. H.

NEW UNIONISM, or the NEW TRADE-UNIONISM, are phrases used in England and, to a less extent, in America, to denote the tendencies toward socialism recently developed in labor organizations. The new tendency is, however, to be considered simply as a natural outgrowth of the old unionism, due to changed conditions. It was widely claimed in England, ten years ago, when the new unionism movement began, that the old unions had become largely conservative. Their aim, it was said, was not to change the conditions of working people, but merely to strike the best bargain possible for their own members, in the amount of wages to be paid, or the hours to be worked. This was the result, said the believers in the new unionism, of the long battle of the unions for existence. From 1824, when, to a very limited extent and for very limited purposes, trade-unions were first legalized in England (see **TRADE-UNIONS**; Section, England), down to 1875, when, alone, they emerged, to use the words of Mr. George Howell, "from the last vestige of the criminal laws specially appertaining to labor," the long struggles for legal existence had almost compelled the leaders of the unions to renounce the old Utopian socialism of the Owenites and Chartists and to contend for the right of combination on the somewhat individualistic ground that the individual worker, having a right to dispose of his labor as he pleased, had a right to enter into combinations to dispose of his labor if he so chose. The taking of this position seemed, under the ideas dominant in England during the period, the only way to obtain for the unions legal recognition, and it undoubtedly coincided with many of the individualistic ideas of the trade-union leaders of the times. (For a full account of this see Webb's *History of Trade-Unionism*.) Be this as it may, however, the taking of such a position naturally gave the unions something of an individualistic bias, and, when they finally won complete legal recognition, and grew somewhat strong and respectable, the result

was that they became, at least in the opinion of many, somewhat reactionary trade benefit societies, organized not to fight the battles of the working classes generally, but simply to give benefits and gain advantages for their members only. This led insensibly to the trade-unions becoming somewhat of an "aristocracy of labor." Benefit societies are somewhat slow to take into their membership the lower classes of wage-earners, who are likely at any moment to be thrown out of work or placed on the needy list, and so, to an extent, the trade-unions limited their membership to the better paid members of their trades. This, however, hurt the trade-unions. Keeping the unskilled workman out of the organizations did not at all keep him from competing in the open market; and, whenever there was a labor dispute, it was always handicapped against the men by the large number of the semi-skilled, who were able, and almost compelled by their helpless condition, to take the place of the union men who refused to work. With such a prospect it is not surprising that trade-unions were steadily and surely becoming of less importance. Such was the condition of affairs in England when the new unionism was developed.

The socialist propaganda, beginning in 1880, had rapidly made headway, and, within a few years, made a great impression on the minds of the workers in all the industrial centers. Confining their efforts mainly to propaganda, the socialists worked quite on separate lines from the trade-unionists, often antagonizing them for their conservative tendencies. In 1888 a number of socialists, many of whom were members of trade-unions, undertook the task (hitherto deemed impossible) of organizing the unskilled workers into a trade-union. The revival in trade helped them, and one of the first unions organized, "The Gasworkers' and General Laborers' Union," within a year of its foundation had gained for its members such substantial benefits in the shape of an eight-hour working day, and an increase of pay, that the example was like a new life in waking from apathy those who before were hopeless. The success of the great "dock strike" (see **DOCK STRIKE**), which followed within a few months, was made possible by the new awakening, and was itself the beginning of a period of general activity among labor organizations. It was a new ideal, infusing new life. The immediate condition of the members of a union was not the only point that was considered. Speaking at a conference on the organization of industry, at Oxford, in 1890, Mr. Tom Mann (see **TOM MANN**), who was one of the first of these socialists to undertake trades organization, said:

"As industry is conducted to-day, there are at all times a large number of persons who cannot find work, and, in consequence, cannot get the ordinary necessities of human existence. . . . I know that in the East End of London there are at least 30,000 men who have been unable to obtain work to-day; that there will be quite that number any day this week, and quite that number any and every day next week, and so on all through the winter. . . . That is a state of affairs so frightful that it will not bear calm contemplation without making the blood boil in the veins of straightforward men and women. And

because it is recognized as being so serious, we who have been identified with some of the trade-union work of late say that this question of the inability of large numbers of persons to get the wherewithal to live a decent life must be met. . . . At least we are bound to try and do our level best toward that. . . .

"There is no quarrel between the new and the old [trade-unions]; and I hope that will be allowed to be emphasized here. . . . Some of the younger men of to-day say, not merely must trade-unions look after the regulations and hours of labor and the rate of wages, but so long as this frightful social problem is there, it must receive attention, and the trade-unionists, if they are to justify their existence in the future, must be men who will give it attention with a view to solving it. Therefore has cropped up what appears to be a difference. The new and old unionists are now working vigorously, with a view not merely to regulating the hours of labor and the wages to be received by those engaged in a given industry, but they are looking in a cosmopolitan fashion on the industrial problem generally."

Mr. Mann's statement of the case gives practically the feeling which animated the leaders of the new departure, and with new ideals came new methods; the sympathetic strike (see STRIKES), political action, etc.

The leaders of the new unionism to a large extent also argued the futility of "strikes" as a means toward curing poverty; the evil they have to contend with is an economic one; and tho strikes may be inevitable accompaniments of the present wage system, they hold that they do not lead the way out. Political means were more and more to be brought to the attention of the workmen.

It is this that has largely caused the growth among the English unions of the Independent Labor party (*q. v.*) and of the capture of the Trade-Union Congress and many of the older unions themselves by those who favor a distinctly political socialist policy. (See ENGLAND AND SOCIAL REFORM.)

The new unionism has largely been brought to the front by new leaders. These have by no means agreed, and often have bitterly differed, as to how and by what political party the new political program could be best advanced; but they have all agreed that in some way the labor movement must find its solution to a large extent in political channels, altho without by any means giving up trade-union organizations. Their course has been not to destroy trade-unions, but to create more unions and to convert all to socialism. Prominent among these leaders have been John Burns, Tom Mann, and Ben Tillett (*q. v.*). These men first organized the gasworkers and were the leaders in the Dock strike (*q. v.*). To John Burns and to Tom Mann too has been largely due the gaining of the supremacy for the new unionism in the Trade-Union congresses. At the Liverpool congress in 1890, the new unionism gained a large majority, so much so that the Northumberland and Durham miners separated from the Miners' Federation, and favoring the old policy, have voted not to send delegates to the congress this year (1895), on the ground that the congress has become a socialist body and was largely responsible for the defeat of the Liberals this year (1895). This year, however, the vote went against socialism. Burns and Mann have parted company; Mann working with Keir Hardie in the Independent Labor party, and Burns being a strong advocate of the "progressive" policy,

and believing that socialism can be best advanced at present through the Liberal party. For taking this position he is bitterly denounced, both by the Social Democratic Federation and the I. L. P., and these and other disagreements, together with general trade depression, which has broken up some of the newly formed trade-unions among the lower paid workers, is at present giving the new unionism something of a set-back.

In the United States the new unionism has been identified with the policy of the Socialist Labor party and has led to a bitter struggle in the labor movement, the socialists claiming to have at least one-half if not the majority of American trade-unionists to-day. (See TRADE-UNIONS; section, The United States. See also SOCIALISM.)

NEW ZEALAND AND SOCIAL REFORM.—New Zealand is in many ways in social reforms the most progressive community in the world, its nearest rival being Switzerland (*q. v.*).

The area of New Zealand, including the two main islands and the smaller ones, is 104,471 square miles, or nearly that of Great Britain and Ireland. The first authentic discovery of New Zealand was by the Dutch navigator, Tasman, December 13, 1642. No one seems to have visited the island after this till Captain Cook did so in 1769. Missionaries came to the island in 1814. Colonization was first attempted in 1825, but was unsuccessful. In 1838 the New Zealand Company was formed, and the first body of immigrants arrived January 22, 1840, and founded the town of Wellington. The colony was a dependency of New South Wales till 1841, when it was made a separate colony. In 1852 representative government was established, with a governor appointed by the Queen, a legislative council nominated by the governor, and an elective House of Representatives. The suffrage was practically household suffrage. In 1893 complete suffrage was given to women, tho they are not qualified to be members of the Legislature. The seat of government is at Wellington. The Legislative Council consists (1894) of 46 members; the House of 74 members, of which four are Maoris.

Government.

Nearly all the public works of New Zealand are in the hands of the Government of the colony, and in the early days they simply kept pace with the spread of settlement. In 1870, however, a great impetus was given to the progress of the whole country by the inauguration of the "Public Works and Immigration Policy," which provided for carrying out works in advance of settlement. Railways, roads, and water-races were constructed, and immigration was conducted on a large scale. As a consequence, the population increased from 267,000 in 1871 to 672,265 at the close of the year 1893, exclusive of 41,993 Maoris. In 1891, 77.25 per cent. could both read and write; 67.62 were unmarried. There were 70,197 men over 20, and 67,000 women over 15, unmarried. Of those having occupations 70,521 (11.25 per cent.) were engaged in manufacture; 68,607 (10.94) in agriculture; 24,928 in domestic occupations; 22,992 in trade; 16,927 in mining; 15,821 in professions; 15,413 in transportation; 369,178 were dependent on natural guardians (scholars, etc.); 4717 were in some way dependent upon public or private support.

Statistics.

The birth rate for 1893 was 27.50 per 1000, lower than in any Australian colony; 3.79 per cent. were illegitimate; in England it was 4.2 in 1891. The death rate was 10.23.

The shipping entered inward for the year 1893 included 617 vessels, of 615,604 tonnage; 635 vessels were cleared outward, of a tonnage amounting to 642,466. The imports in 1893 amounted to £6,911,515; the exports to £8,985,364. The chief exports were wool, frozen meat, gold, and agricultural products.

The revenue of the general Government is of two kinds—ordinary and territorial. The ordinary revenue for the year ended March 31, 1894, amounted to £4,055,479, and the territorial to £313,059, giving a total revenue of £4,368,538.

The principal heads of ordinary revenue were: customs, £1,655,503; stamps (including postal and telegraph cash receipts), £674,647; land tax, £285,327; income tax, £75,238; property tax, £1412; beer duty, £61,808; railways, £1,175,548; registration and other fees, £49,290; marine, £20,183; and miscellaneous, £56,523.

Revenue.

The territorial revenue comprised receipts from pastoral runs, rents, and miscellaneous items, £184,380, together with proceeds of land sales, £128,670.

The total revenue (ordinary and territorial), including the proceeds of £284,500, debentures issued under "The Consolidated Stock Act, 1884," for the accretions of sinking fund for the year, amounted to £4,653,038. The customs duties constitute the largest item of revenue, nearly all classes of imports being subject to taxation.

The ordinary expenditure under permanent and annual appropriations was £4,386,350, the chief items being—charges of the public debt, £1,885,697; working railways, £731,844; public instruction, £388,652; postal and telegraph, £292,433; defense and police, £171,073; subsidies and other payments to local bodies, £149,810; crown lands, surveys, and inspection of stock, £119,096; justice, £115,024; hospitals, lunatic asylums, and charitable institutions, £115,858; and pensions, compensations, and other expenditure under special Acts of the Legislature, £80,984.

Expenditure.

In addition to (£4,386,350) the ordinary expenditure, £250,000 was transferred to the public works fund for the construction of reproductive works, and in aid of settlement of the land; and an additional extraordinary charge of £10,220 in connection with the purchase of the Cheviot estate was provided.

The total ordinary and territorial revenue, together with the proceeds of debentures issued for the accretions of sinking fund, amounted to £4,653,038. It will, therefore, be seen that the revenue for the year exceeded the expenditure (including the sums transferred to the public works and Cheviot estate purchase accounts) by £26459; and that, by adding the credit balance brought forward at the beginning of the year (£283,779), there remains a net surplus on March 31, 1894, of £290,238.

Besides expenditure out of revenue, there was also an expenditure out of the public works fund of £400,475, of which £176,254 was for construction of railways, £147,668 for roads, £4320 for purchase of native lands, £44,092 for public buildings, £16,127 for telegraph extension, £688 for lighthouses and harbor defenses, etc.; £78,48; besides the above was expended for acquiring native lands.

The Assessment Act of 1891 provides for an ordinary land tax on the actual value of land, and an owner is allowed to deduct any amount owing by him secured on a registered mortgage. Under the original Act the deduction for improvements might not exceed £3000; but, by Amendment Act of 1893, the value of all improvements whatsoever is exempted from liability to land tax. Besides this, an exemption of £500 is allowed when the balance, after making deductions as above stated, does not exceed £1500; and above that a smaller exemption is granted; but it ceases when the balance amounts to £2500. Mortgages are subject to the land tax. The revenue from the land tax is, in round numbers, £285,000 per annum. The rate of ordinary land tax for 1893-94 was 1*d.* in the pound.

Taxes.

In addition to the ordinary land tax there is a graduated land tax, which commences when the unimproved value is £5000. For the graduated land tax, the present value of all improvements is deducted; but mortgages are not deducted. The Act for 1893, while reducing the ordinary taxation on land by exempting all improvements, increased the graduated tax, and the revised rates are now one-eighth of a penny in the pound sterling when the value is £5000 and is less than £10,000, from which the rate increases by further steps of an eighth of a penny with the value of the property, until the maximum of 2*d.* in the pound is reached, payable when the value is £210,000, or exceeds that sum.

This graduated tax yields, in round numbers, £83,000 per annum, which is included in the sum of £285,000 given above. Twenty per cent. additional tax is levied in case of persons who have been absent from the colony for three years or more prior to the passing of the yearly taxing Act. This amounts to about £1000, and is included in the £83,000 shown above.

Income tax is levied on all incomes above £300, and from taxable incomes a deduction of £300 is made. The rate of income tax for 1893-94 was 6*d.* in the pound on the first taxable £1000, and 1*s.* in the pound on taxable incomes over £1000.

The amount raised by taxation in 1893 was £3 11*s.* 2*d.* per head, exclusive of Maoris.

The net public debt, after deducting the accrued sinking fund (£951,924), was on March 31, 1894, £38,874,491, an increase of £730,421 during the year.

The following may be stated as approximately representing the loan expenditure by the general Government on certain public works to March 31, 1894:

Telegraphs.....	£679,793
Water-works on gold-fields.....	572,441
Immigration.....	2,146,552
Roads and bridges.....	3,855,455
Land purchases.....	1,297,517
Lighthouses, harbors, and defense works.....	906,958
Public buildings, including schools.....	1,890,711
Coal-mines and thermal springs.....	25,435

Railways (by the Provincial and General

Governments).....15,759,308

The above several items of expenditure give a total of £27,134,170. To this must be added so much of the loans raised by the various local bodies as have been devoted to the construction of harbors, roads, and other public works; together with the amounts expended out of loan by the Provincial Government on immigration and public works other than railways. The expenditure on directly reproductive works—railways, telegraphs, and water-works—has been £17,015,542. The expenditure on land is also partly reproductive, and that on immigration, roads, bridges, and light-works indirectly so.

The private wealth is estimated in the official year book for 1894 at about £159,958,273, or £232 per head.

Mulhall's *Dictionary of Statistics* estimates the wealth of the United Kingdom at £247 per head, France £224, Holland £216, the United States £210, Germany £140, Australia £310.

Dealing only with persons returned as in receipt of wages or salary, and discarding all who derive their incomes from professional or trade profits, it is roughly estimated that the aggregate of the wages paid in the colony for the year amounts to £12,998,546,

Wages.

of which sum £11,083,521 is earned by males, and £1,915,025 by females; the average yearly earnings being £92 12*s.* for the one sex, and £33 18*s.* for the other. In industry it was £80 and £31 7*s.* and in agriculture £77 7*s.* and £17 6*s.*

An estimate has been made of the cost of living in New Zealand, which shows a total expenditure of £23,349,623 on food, drink, stimulants, clothing, fuel, light, rent, and furniture, with allowance for such matters as attendance (personal and medical) and other accessories to the primary needs of life. The rate arrived at per head of population is £35 6*s.* 1*d.*

The length of government railways open for traffic on the 31st of March, 1894, was 1948 miles, the total cost thereof having been £15,137,036, and the average cost per mile £7770. The cash revenue for the year 1893-94 amounted to £1,172,792 17*s.* 2*d.*, excluding the value of postal services; and the total expenditure to £735,388 15*s.* 1*d.* The net cash revenue—£437,404—was equal to a rate of £2 17*s.* 0*d.* per cent. on the capital cost; the percentage of expenditure to revenue was 62.7.

Altho not included in the figures for the revenue, the real gain to the colony is greater than the net revenue shown by the value of the postal services performed by the railways (carriage of mails, etc.), amounting to £27,000 per annum.

In addition to the above railways there were 164 miles of private lines open for traffic on the 31st of March, 1894.

The passenger fares on the New Zealand railways are generally at the rate of 2½*d.* per mile first class, and 1½*d.* per mile second class; the return fare being calculated at one-third increase on these rates. For suburban and local traffic, however, the rates are much lower; in some cases of commutation tickets being as low as ¾*d.* first class, and ½*d.* second class, per mile; while excursion and tourist traffic is encouraged by greatly reduced fares during the season for such business.

The number of post-offices open for the transaction of money-order and savings-bank business at the end of 1893 was 339.

There were 29,755 new accounts opened in the year, and 10,599 accounts were closed. The total number of

open accounts at the end of 1893 was 122,684, of which 89,260 were for amounts not exceeding £20.

The total sum standing at credit of all accounts on December 31, 1893, was £3,241,998 7s. 10d., which gave an average of £26 8s. 6d.

There are seven savings-banks in the colony not connected with the post-office. The total amount deposited in them in 1893 was £456,262 13s. 10d., of which the deposits by Maoris comprised £154 15s. 10d.

There were 48 registered building societies in operation in the colony at the end of 1892.

The results of the last census show that in April, 1891, there were in New Zealand 43,777 occupied holdings of over 1 acre in extent, covering an area of 19,397,529 acres, of which 12,410,242 acres were freehold of the occupiers, and 6,987,287 acres were rented from, (1) Private individuals, (2) natives, (3) public bodies, and (4) the Crown (for other than pastoral purposes). The following table shows the number of holdings of various sizes, and number of acres held in fee-simple and on lease, excluding the Crown lands rented for pastoral purposes only :

SIZES OF HOLDINGS.	NUMBER OF HOLDINGS.	ACREAGE.	
		Freehold.	Leasehold, etc.*
1 to 10 acres,	11,116	28,124	24,343
10 " 50 "	8,899	148,965	105,751
50 " 100 "	3,613	277,135	159,128
100 " 200 "	6,851	654,729	374,022
200 " 320 "	3,916	609,857	403,462
320 " 640 "	3,802	1,057,076	660,070
640 " 1,000 "	1,321	662,612	395,849
1,000 " 5,000 "	1,675	2,144,627	1,280,558
5,000 " 10,000 "	247	1,008,810	550,080
10,000 " 20,000 "	189	1,011,063	788,341
20,000 " 50,000 "	117	2,597,848	833,083
50,000 " 100,000 "	24	801,647	723,000
Upwards of 100,000 acres,	7	397,140	680,700
Totals, 1891,	43,777	12,410,242	6,987,287
Totals, 1886,	36,485	11,728,236	5,348,838
Totals, 1881,	30,832	10,309,170	4,897,727

The extent of land rented from the Crown for pastoral purposes, including the small grazing-runs, amounted in April, 1891, to 12,469,976 acres.

It may be said, without fear of contradiction, that there is no part of the British dominions where agriculture, in its widest sense, can be carried on with so much certainty and with such good results as in New Zealand. The range of latitude, extending as it does from 34° to 47° south, secures for the colony a diversity of climate which renders it suitable for all the products of subtropical and temperate zones, while the insular position protects it from the continuous and parching droughts which periodically inflict such terrible losses on the agriculturist and pastoralist of Australia and South America. The chief crops are: oats, wheat, hay, barley, potatoes, etc.

* Excluding Crown pastoral leases.

The preceding shows the number of distinct persons (exclusive of Maoris) imprisoned in the past seven years after conviction, only one cause being given when the person was imprisoned at different times, either for the same or for some other offense :

Crime, etc.

Thus in 1886 these convicted prisoners averaged 47.82 in every 10,000 of the population; in 1887, 44.25; in 1888, 41.81; in 1889, 39.00; in 1890, 38.61; in 1891, 33.55; and in 1892, 33.69. There has been since 1886 a decrease at the rate of 23.83 per cent. in the number of distinct convicted prisoners, and a reduction of 14.13 in the proportion to population. In New South Wales the proportion for 1892 was at the rate of 75 per 10,000 persons.

It must be understood that the actual number of imprisonments for some of the above offenses was much in excess of the figures given, as many were several times imprisoned, either for offenses differing in kind or for repetitions of the same offense. Thus, many persons returned as imprisoned for larceny underwent other imprisonments for drunkenness, etc. Many returned as convicted of drunkenness were several times in jail during the year for the same offense, or for some other, such as assault, riotous or indecent conduct, etc. Often there were several charges against the same person at the one time, of which the most serious followed by conviction has been selected.

The proportion of assaults is found to be less for 1892 than for any of the previous four years. In the year 1887 it was as high as 1.23 per 1000. For larceny the proportion was highest in the year 1889, when it stood at 1.77 per 1000 persons. The figures of 1892 (1.41) are the lowest for the quinquennium. Similarly, for drunkenness, the record for 1892 shows a lower rate than obtained in the other years. The range for seven years is from 10.28 per 1000 persons in 1885 to 7.87 in 1892.

To judge by the consumption of beer, wine, and spirits in 1886 and 1892 respectively, there has been a falling off during the last seven years in the use of alcoholic liquors in this colony.

CONSUMPTION OF BEER, WINE, AND SPIRITS PER HEAD OF POPULATION (EXCLUDING MAORIS).

	Beer. Gal.	Wine. Gal.	Spirits. Gal.
1886.....	7.861	0.212	0.620
1892.....	7.807	0.174	0.708

The petitions in bankruptcy numbered 507 in 1892, of which 479 were made by debtors and 28 by creditors. This number was the lowest for seven years.

The proportion of petitions and decrees for dissolution of marriage to the number of marriages is higher in New Zealand than in England and Wales, but lower than New South Wales or Victoria. The proportion in every 1000 marriages for these countries is as follows:

COUNTRY.	Petitions for Dissolution of Marriage.	Decrees for Dissolution of Marriage.
New Zealand (1892).....	7.50	4.50
England and Wales.....	1.88	0.95
New South Wales (1892)....		8.85
Victoria (1892).....	21.75	11.80

In 1889 an act was passed in Victoria to allow of divorces being granted for wilful desertion, habitual drunkenness with cruelty or neglect, imprisonment under certain circumstances of either party, and adultery on the part of the husband. These additional causes for divorce have largely increased the proportion of decrees in that colony.

At the end of 1892 there were 1686 government schools of all classes, at which members of the European and Maori races were being educated. The public primary schools numbered 1302 in 1892.

Education at the public schools is free (except that

at such as are also district high schools fees are charged for the teaching of the higher branches) and purely secular. The attendance of all children between the ages of 7 and 13 is compulsory, except when special exemptions are granted, or they are being otherwise sufficiently educated.

There were 274 private schools in the colony at the end of 1892, a decrease of 7 on the number in 1891; 29 were for boys, 47 for girls, and 198 for children of both sexes. The number of pupils attending them was 14,456—namely, 6321 boys and 8135 girls, not counting Maoris—7 boys and 4 girls. The number of European pupils at these schools was greater than in 1891 by 314. Of the private schools 105 were Roman Catholic, with an attendance of 10,111 pupils.

Concerning the land system of New Zealand of which so much has been written and concerning which so much interest is taken because of its bearing upon the problems of land reform, Mr. S. Percy Smith, F. R. G. S., Secretary for Crown Lands and Surveyor-general, says:

“The Crown lands of New Zealand are administered under ‘The Land Act, 1892,’ and the regulations made thereunder.

“The distinguishing features of the present land system are the outcome of ideas which have been gradually coming to maturity for some years past in this colony. These features involve the principle of State ownership of the soil, with a perpetual tenancy in the occupier. This, whatever may be the difference in detail, is the prevailing characteristic in the several systems under which land may now be selected. In New Zealand, this tendency to State ownership has taken a more pronounced form than in any other of the Australasian colonies, and the duration of the leases has become so extended as to warrant the name, frequently given to the system, of ‘everlasting leases.’ In point of fact, most of the Crown lands are now disposed

Land Tenure.

of in leases which have a currency of 999 years. They are leased at a fixed rental based on the assessed value of the land at the time of disposal, without recurring valuations. . . One of the most striking results of this system is the advantage it gives to the poor man, who, with little more capital than his strong right arm, is enabled to make a home for himself; which, under the freehold system, he is frequently not able to accomplish.

Again, underlying the whole of the New Zealand land system is a further application of the principle of “the land for the people,” that of the restriction as to area which any man may hold. This principle has been forced upon the attention of the legislature by defects in former systems, under which one individual with means at his command could appropriate large areas, to the exclusion of his poorer fellow settler.

“The Land Act of 1892 provides for a special class of settlement, which has been taken advantage of to a very considerable extent during the last two years. This system is known as the ‘small-farm association’ system. It provides that, where not less than twelve individuals have associated themselves together for mutual help, such an association can, with the approval of the minister of lands, select a block of land of not more than

11,000 acres, but there must be a selector to each 200 acres in the block. The extreme limit that one person can hold is fixed at 320 acres. Lands under this system are held on ‘lease in perpetuity’ for 999 years, in the same way as lands under the same tenure when thrown open for free selection. The conditions of residence and improvement are the same. The system offers many advantages to the settler, so long as the blocks of land are judiciously selected, having regard to quality of land, access, markets, and the probability of employment being obtained in the neighborhood. In the eagerness to obtain lands on such easy terms, these points have, in the past, not been sufficiently attended to by some of the associations, and in consequence the success of many remains to be proved.

“The following figures show the extent to which settlers have availed themselves of this class of settlement during the two years ending March 31, 1894; the figures represent approved applications only; 1128 selectors took up 266,233 acres, in 35 blocks.

“The ‘village-settlement system’ of New Zealand has become widely known in the Australian colonies, and has excited much inquiry, with a view to its adoption in other parts. It is believed, however, that this and the ‘small-farm association’ system, referred to above, are often confounded in the minds of the public, for of recent years there has been no very great extension of the village-settlement system in this colony. The system was initiated in 1886, by the late Hon. John Ballance, with the intention of assisting the poorer classes to settle on the land. It became immediately very popular, and by its means a considerable number of people were settled on the land, who otherwise would possibly never have become landholders. The features of the system were, originally, the possession of a small farm, not exceeding 50 acres in extent, held under a perpetual lease for terms of 30 years, with recurring valuations at the end of each term. The rental was 5 per cent. on a capital value of not less than £1 an acre. Residence and improvement of the soil were compulsory. The new and important feature in the village-settlement system, however, was the advance by the State of a sum not exceeding £2 10s. per acre, up to 20 acres, for the purpose of enabling the settler to cultivate the land, and of a further sum, not exceeding £20, to build a house with, on which he paid interest at the rate of 5 per cent. Road works were also very frequently undertaken in the neighborhood of these settlements, which have been of very great help to the settlers. Under this system a number of settlements were formed, and, where the sites were chosen judiciously, a large measure of success has resulted therefrom.

“The present law admits of similar village settlements, but the area which a selector may hold has been increased to 100 acres, and the tenure changed to a ‘lease in perpetuity’ for 999 years, on a 4-per cent. rental. Advances for clearing and house-building have, however, practically ceased, and, indeed, few set-

tlements have lately been started; one of the principal reasons being the dearth of suitable localities in which to plant them. This is owing to the limited area of Crown lands adapted to the special features of 'village settlements.'

"A modification of the system has been introduced, however, which, so far as can be judged at present, will eventually take its place. In order to find work for the unemployed, considerable areas of forest-clad Crown lands have been set aside, and small contracts for the clearing, burning, and sowing these with grass have been let. The ultimate intention is to subdivide these areas into small farms, to be let on lease 'in perpetuity' on a rental sufficient to cover the cost of clearing, etc., together with a fair rental of the land. Only one such settlement under this system has at present been allocated to settlers, and, so far, is successful."

Concerning the New Zealand system of constructing public works, H. J. H. Blow, Under Secretary for Public Works, says: "The great bulk of our railway and road works, and much of our building work in New Zealand, is now carried out under what is known as the cooperative system, an arrangement which has only been brought into operation within the last three years or so.

"The contract system had many disadvantages. It gave rise to a class of middlemen, in the shape of contractors, who often made large profits out of their undertakings, and at times behaved with less liberality to their workmen than might have been expected under the circumstances. Even in New Zealand, where the labor problem is less acute than in older countries, strikes have occurred in connection with public works contracts, with the result that valuable time has been lost in the prosecution of the works, much capital has been wasted by works being kept at a standstill and valuable plant lying idle, and large numbers of men being for some time unemployed; and considerable bitterness of feeling has often been engendered. The contract system also gave rise to subcontracting, which is worse again; for not only is it subject to all the drawbacks of the parent system, but by relegating the conduct of the works to contractors of inferior standing, with little or no capital, the evil of 'sweating' was admitted. Very often, too, the business people who supplied stores and materials were unable to obtain payment for them, and not seldom the workmen also failed to receive the full amount of their wages. The result in such cases was that instead of the expenditure proving a great boom to the district in which the works were situated, as would have been the case if the contract had been well managed and properly carried out, such contracts frequently brought disaster in their train. The anomaly of the principal contractor making a large profit, his subcontractor being ruined, and his workmen left unpaid, also occasionally presented itself, and thus the taxpayer who provided the money had the mortification of seeing one man made

Cooperative Public Works.

rich (who would perhaps take his riches to Europe or America to enjoy them) and a number of others reduced to poverty, or in some instances cast upon public charity. . . .

"The cooperative system was designed to overcome these evils, and to enable the work to be let direct to the workmen, so that they should be able, not only to earn a fair day's wage for a fair day's work, but also to secure for themselves the profits which a contractor would otherwise have made on the undertaking.

"It also places the workman on a much higher plane, and enables him to comprehend more fully the dignity of labor. Under the cooperative system every workman is a contractor, and has a personal interest in the economical and successful carrying out of the work. He is also his own master.

"Not only does the system offer these solid and very real advantages to the workmen, but it also offers substantial advantages to the State. Under this system works are carried out for their actual value—no more and no less.

"The work is valued by the engineer appointed to have charge of it, before it is commenced, and his valuations are submitted to the engineer-in-chief of the colony for approval. When approved they constitute the contract price for the work; but they are not absolutely unchangeable as in the case of a binding, strictly legal contract. It frequently happens under an ordinary contract that work turns out to be more easy of execution than was anticipated, and the State has to see its contractors making inordinate profits. Sometimes, on the other hand, works cost more than expected; but in most cases of this kind the contractor either becomes bankrupt, so that the State has, after all, to pay full value for the work, or, if the contractor happens to be a moneyed man, he will probably find some means of getting relieved of his contract, or of obtaining special consideration for his losses on completion of his work. Under the cooperative system, if it is found that the workmen are earning unusually high rates, their contracts can be determined, and be relet at lower rates, either to the same party of men, or to others, as may be necessary. Similarly, if it is shown, after a fair trial of any work, that capable workmen are not able to earn reasonable rates upon it, the prices paid can, with the approval of the engineer-in-chief, be increased, so long as the department is satisfied that the work is not costing more than it would have cost if let by contract at ordinary fair paying prices. . . .

"Work also is better done under the cooperative than under the contract system. Under the former method the Government finds its own materials, which are carefully selected to insure their being of the best class: and the workmen, therefore, have no interest in stinting the use of material to try to effect savings, while the government overseers, of course, see that there is no waste. No attempts are now made to put whitening into the paint instead of white lead, or to introduce inferior brands of cement or iron into

the works, and no walls are built dry in the center, or filled in with bats, as it is easier for the men to construct the work of sound materials than with rubbish. All stores are purchased by the Government's own officers, and are supplied to the cooperative contractors from the government store, so that the department knows exactly what class of materials is used. The workmanship put in is also of a superior kind. The men are the contractors themselves; they take a pride in their work, and have no taskmaster standing over them, finding fault with them for being too particular and taking too much pains. All the work done under the cooperative system will bear comparison with any similar work done by contract, and will generally show to advantage.

"The system was first tried in connection with formation-works on roads and railways, including small bridges and culverts, and other similar works, but it has now been extended to the erection of iron bridges (the ironwork being supplied and delivered at the sites of the bridges by the department), the supply of sleepers, the laying of the permanent way, the construction of timber bridges up to £2000 in value, and of masonry abutments and piers for bridges, and the erection of stations and other public buildings, etc. . . .

"As it often happens that men are working at a distance from where their families live, the government paymaster is instructed to offer his services in conveying remittances to the nearest money-order office for transmission to their wives, or for deposit in the Post-office Savings Bank; and any men not remitting to their families, but allowing them to become a charge upon public charity, are dismissed from the works.

"Should any of the men desire to leave the works, no impediment is placed in the way of their doing so. . . .

"All men employed on government cooperative works are selected by the Government Labor Bureau, and in selecting them the following rules apply:

"1. Applicants not previously employed on government cooperative works have priority of claim over men who have recently been so employed.

"2. Men resident in the neighborhood of the works have priority over non-residents.

"3. Married men have priority over single men.

"4. In recording the applications of men who have previously been employed on government cooperative works, the dates when they left such works are noted, and those longest off such works are considered first.

"5. All applicants for work must have been at least one week out of employment before they can apply, and all men previously employed on government cooperative works must have been at least fourteen days off such works prior to re-registration as applicants for further work.

"6. If there are more applicants for work than there are vacancies to fill, a ballot is taken to determine the particular men to be em-

ployed. Such ballots are conducted in the presence of the men interested, and members of local bodies in the district may also be present if they wish. . . .

"The number of men employed under the cooperative system from time to time varies greatly; but about 2000 may be taken as the average number for the last year or so."

Concerning State Insurance in New Zealand, the *Year Book* for 1894 says (p. 266): "It is needless to dwell upon the foundation of the institution in 1869,—at a time when New Zealanders had poor facilities for the insurance of their lives,—nor is it necessary to speak in detail of the history of the early years of the office. But it may be said that at a very early stage it was thought advisable to adopt the practice of employing paid canvassers, and without them it is quite certain that no voluntary scheme of life insurance, however attractive, can become completely successful. Since that time the principles on which the department has been managed have been much the same as might guide any progressive and soundly conducted private life insurance office. . . . To-day the inhabitants of New Zealand carry more life insurance in proportion to their numbers than the people of any other nation on the globe. . . . For this result the State office is responsible to the extent of holding, approximately, one-half of the total insurance of the colony.

State Insurance.

"The major part of the business is composed of ordinary whole-life and endowment assurance policies, which are almost equally fancied by the insuring public of New Zealand; in 1893 there were issued 1447 new policies payable at death for £389,000, and 1757 endowment assurances for £348,000. The total amount insured by the policies on the books of the department has now reached nine millions sterling, being over £12 for every man, woman, and child within the area of its operations."

Concerning the unemployed, we learn from the report of the (English) Royal Commission on Labor that, in June, 1801, a Government Bureau of Industries was established in New Zealand with the object of collecting statistics and controlling the movements of labor so as to secure work for the unemployed. Between that date and March, 1892, 2400 persons were assisted to find work. Eight hundred of these were employed in constructing roads and railways, and in other public works, on the gang or contract system, according to which one man is elected "ganger" or trustee, and deals with the Government on behalf of the rest. Small farms, to be cultivated by working men in village settlements, are also provided by Government.

The Unemployed.

According to the report, "A State farm is to comprise about 1000 acres of land, fit for agricultural purposes, and to this farm will be drafted the surplus workmen of the towns. Many of the 'unemployed' applying at the Labor Bureau are clerks, stewards, firemen, tailors, printers, etc., who, crowded out of their regular em-

ployments, are in a state of destitution; these being in addition to a large number of general laborers, who, though used to pick or shovel, have no knowledge of work upon farm or station. All these could be sent with advantage to some farm or station, where, in return for some small wage, they could assist in the general work of the farm and make its cultivation pay expenses, while, in the meantime, the workmen themselves were being trained to habits and duties fitting them for the general labor market. It is desired that buildings should be erected by the men themselves, with the help of some skilled assistance; that cottages should be built for married men with families, and that to those who show themselves most interested and capable, cooperate shares in the profits of the farms should be given." This system has not given perfect satisfaction, the complaint being made that the Government uses these colonies to get votes, etc., etc., but, nevertheless, it is undoubtedly a long step in advance.

Cooperation and profit-sharing in general have had little success. The Mosgril woolen factory, at Ashburton, in New Zealand, is conducted successfully upon cooperative principles, in 1891 paying a dividend of 8 per cent.

NICARAGUA CANAL.—The canal route through Nicaragua has been advocated at various times for nearly 50 years. Its advantages are said to be that in Nicaragua is the greatest depression of Central America; that there is a large navigable lake situated on the route; and that Nicaragua is more in the path of commerce than the Isthmus of Panama. The region, moreover, is more healthy, and of greater natural resources than that of Panama.

Several important surveys were made previous to 1879, and concessions were secured and companies formed, both by Americans and French. But in 1879 a commission, appointed by the United States Government, examined the various surveys and made a report, estimating the cost of the canal as \$100,000,000. Mr. Mendeal, a civil engineer of the United States Navy, estimated it, however, at only \$40,910,839.

Owing to disputes over the Mosquito territory, the Clayton-Bulwer treaty, made between the United States and Great Britain, April 19, 1850, has this clause: "The Governments of the United States and Great Britain, declare that neither one nor the other will obtain or maintain for itself any exclusive control over the said canal."

On February 20, 1889, the Maritime Canal Company of Nicaragua was incorporated by a Congressional Act. A liberal concession had previously been secured from Nicaragua. Work was begun in June, 1889; and in October, 1890, \$2,000,000 had been expended. The work is under the charge of the Nicaragua Canal Construction Company, which made a contract with the Maritime Canal Company to construct the canal.

The length of the canal route is 169½ miles, and it runs from Greytown on the Atlantic to Brito on the Pacific. Brito is only an open roadstead, but heavy break-waters are projected. At Greytown there is a harbor, whose entrance has been choked by sand within a few years. A channel about 12 feet deep has been dredged, and a jetty 100 feet long built out from the shore to protect the channel. The first section of the canal runs for 9¼ miles through low grounds. The dimensions here are 120 feet wide at bottom, 288 at surface, 28 feet deep. There are several locks. All the locks in the canal are 80 feet wide and 650 feet long, and some of them are to have a lift of 45 feet. Then comes a cut 2.9 miles long, average depth 141 feet, through rocky material. The route continues through the basin of the San Francisco river, which is a tributary of the San Juan. By damming, an artificial lake, 12½ miles long, is made, which extends to the San Juan river. Here will be erected a dam 70 feet high, by which the water of the river above and of Lake Nicaragua will be raised several feet. Further embankments above are also required.

The river channel near the lake, and the lake itself for 20 miles from its shore, will require to be dredged. The lake depth to be secured is 30 feet. Lake Nicaragua is 56½ miles wide. The distance from its western shore to the Pacific is 17.04 miles, and there will be three locks with lifts of 42½ feet each.

Work on the canal was suspended in 1893 on account of lack of funds. A commission of civil engineers, in the employ of the construction company, had estimated in May, 1889, the total cost at \$87,799,570.

NIEUWENHUIS, FERDINAND DOMELA.—The most prominent communist socialist in Holland. Born at Amsterdam in 1846, and educated for the ministry at Luther College, he became a clergyman in Harlingen, 1870, Beveruyk, 1871, and in 1875 at The Hague. Here he became a celebrated preacher; but in 1879 he left the Church, feeling that it did not fulfil its mission, and was on the side of the rich against the poor. Henceforth he has devoted himself to the socialist propaganda, being for long the head and front of the movement in Holland. In 1879 he founded the *Recht voor Allen*, the main Dutch socialist weekly. From 1888–91 he was a member of Parliament, a position he cared very little for at the last, believing that the Government was so completely in the hands of the capitalists that for socialists to attempt to work through it was worse than useless. The feeling has grown upon him till to-day he utterly opposes the participation of socialists in politics; and he has become, therefore, opposed by the majority of the Dutch socialists, who, like the socialists of all countries, do believe in political action. The socialists often call Nieuwenhuis an anarchist, though he calls himself a communist. His ability and radical utterances still make him popular among the masses, for whom he has sacrificed prospects, money, and reputation. He has published numerous books and pamphlets in Dutch or German, among

which are *My Farewell to the Church, The Labor Day, Capital and Labor, The Book of the Kings, The Life of Jesus, The Bible, Essays on the French Revolution.*

Nihilism (from Latin *nihil*, nothing) is used in philosophy for the doctrine of universal negation, both as to the real existence of anything and therefore as to man's ability to know anything. This lies at the basis of its use as applied to the tenets of the extreme section of Russian revolutionists, who are popularly (tho, as concerns the large mass of these revolutionists, erroneously) supposed to strive for universal destruction of all existing forms of society, without having any program of what should be constructed in the place of present forms. The name Nihilist as so used, was invented by the great Russian novelist Ivan Turgenev, and appears for the first time in his novel *Fathers and Children* (1862), as the nickname of the hero of the story, Bazaroff, who represents the phase of thought which has since been called Nihilism.

The Nihilist movement, however, is in its preparatory forms far older than 1861.

As early as December 14, 1825, there was a so-called Decembrist insurrection which for a moment imperiled the throne of Emperor Nicholas, and seems to have been caused by the spread of political revolutionary ideas in the Russian army, occasioned by their contact with the French army and western civilization, then fresh from the influence of the Revolution. Its aim was the emancipation of the serfs and the establishment of a free constitution. Ruthlessly put down, six of its leaders perishing on the scaffold and 125 being banished to

Origin.

Siberia, it nevertheless sowed through all Russia the seeds of revolution. These seeds were quickened, in the next generation, by the genius of Alexander Herzen (*q. v.*) who, having voluntarily expatriated himself from Russia in order better to serve his country, published from London the *Kolokol* (*The Bell*). Herzen's views were those of a philosophical and individualistic communism. He opposed centralization and advocated State federation. He relied, however, on a purely political and educational program, opposing plots and assassinations. The *Kolokol* had a large sale in Russia. One hundred thousand were confiscated at a single fair at Nijni Novgorod. Herzenism was the rage. It coincided with the individualistic and revolutionary philosophy of the times. Stepniak says in Johnson's *Encyclopædia*: "Primitive and genuine Nihilism was a school of philosophical individualism, which flourished in Russia between 1855 and 1865, and is now entirely extinct. . . . It proclaimed man's absolute independence of all claims which the family, society, the State, had upon him. . . . Those early Nihilists did not deny everything, for they believed firmly, fanatically, in science and the power of the individual mind. But they refused to bow before any authority, and deprecated all that was based upon emotions, fancy, supposed revelations. . . . The years 1860-64 mark the fullest dominion of this school, which found its prophet in Dmitry Pisarev," a writer in the *Russkoi Slovo* (Russian Word.)

But already a new current of thought was arising, favoring social as opposed to individualistic revolution, though not yet taking the form of modern socialism. Nicholas Teherynshevsky, journalist, economist, and novelist, is to be credited with first sowing the seeds of this movement. He brilliantly taught the doctrine of self-immolation and self-abnegation for the people's cause. Called "the La-salle of Russia," his romance *What can be done?* brought modern Nihilism to the birth. Meanwhile, the disastrous shortcomings of the

Act of 1861, emancipating the serfs, prepared the soil for Nihilistic deeds. The emancipation of the serfs (see **RUSSIA AND SOCIAL REFORMS**) broke up the old forms, but gave the serfs no adequate industrial status. The old partly communal and partly feudal rights were taken away, and with nominal liberty the peasants were left more helpless than ever before the greed of the landholding class. The peasants were given only one-third of the land and lost their old grazing rights. Peasant holdings decreased in size, though multiplied in numbers. The landed nobility too, gradually worried the peasants off more lands. According to Stepniak (see his *Russian Peasantry*), one-third of the peasantry became landless. Those that held land held so little that they could not live without attempting other trades. Enormous taxation; the support of an expensive army and central government; above all, misadministration and corruption, rendered the case desperate. Under such conditions, liberty was liberty to starve. The peasants crowded to the cities, and many sought professional life.

Economic Causes.

M. G. de Molinari, writing in the *Journal des Economistes*, in 1878, said that 20 years before 60 per cent. of Russian students were sons of the nobility, but that then only 22 per cent. were noble born. Women, too, sought education. In 1872 there were 500 female students attending medical classes in St. Petersburg, and in 1873 there were 73 female Russian medical students in Zurich. This accounts, in fact, for the large part played in Nihilism by women. The sons of the clergy, too, now for the first time free to choose their career, swelled the crowd of students and increased the competition for existence. To such minds, awakening to new life, yet without the means of livelihood, breaking away from all the restraints of the past, yet surrounded by a debauched, corrupt, despotic government, Nihilism brought a gospel of heroism and self-sacrifice. The students everywhere, especially among the women, responded to its call. *Iti v Narod* (to the people) became the cry. They were willing to sacrifice all and to dare all for the people.

And at this time appeared the most fanatical spirit of the nineteenth century. Michael Bakounin (*q. v.*), born in 1814, of noble family, with an experience as a cavalry officer, disgusted with the despotism of the army, had gone to Moscow and then to Berlin to study Hegelianism. Falling in with Herzen, Proudhon, Marx, and other revolutionary leaders and thinkers, he had been arrested at Dresden, in 1849, for his part in the revolution of 1848, and handed over to the Russian authorities, who imprisoned him eight years in St. Petersburg, and then exiled him to Siberia in 1859. Hence, maddened by his experiences, he escaped through Japan and America, and appeared in 1861 in Italy to become the father of revolutionary Nihilism. Taking part in revolutionary movements in Italy, France, and elsewhere, he made his headquarters in Geneva and here became the head of the

Bakounin.

anarchist wing of the International (*q. v.*). In 1869 he founded "The Alliance of the Social Democracy." It was half secret, half public. It had three sections. The first, "The International Brothers," was composed of 100 of the leaders of the movement, known only to each other. "Their only country was the universal revolution; their only enemies, the reaction." The second section was "the Nationalist Brothers," who were appointed by the "International Brothers" to guide the revolution in their respective countries. The third section was composed of all the simple adherents of the cause. The alliance applied for admission to the International, but was refused as being itself international. It then dissolved and was admitted by sections. Bakounin had long before this begun work in Russia. In September, 1865, Netchaïeff, Bakounin's lieutenant, arrived in St. Petersburg and formed a committee called "The Russian Branch of the International Working Men's Association." "The organization is founded on confidence toward the individual. No member knows in what degree he stands from the center. Obedience to the orders of the committee must be absolute, without hesitation or demur," so runs one of its statements. It was ready for desperate deeds. One Ivanoff, who worked for a while with Netchaïeff and had done much to collect money for poor students, after a while withdrew, not approving the policy of the committee. He was soon after quietly assassinated. Yet Netchaïeff exerted a wide influence. Ogariff dedicated to him a poem, *The Student*, which was widely read and surrounded him with a halo. But Bakounin's utterances grew more radical. He wrote:

"The revolutionist is a man under a vow. He ought to have no personal interests, no business, no feelings, no property. He ought to be absorbed in one single interest, one single passion, revolution. . . . He has only one aim, one science—destruction. For this, and for nothing else, he studies mechanics, physics, chemistry, and sometimes medicine. With the same aim he observes men, characters, the situation, and all the conditions of the social order. He despises and detests existing morality. For him everything is moral that helps on the triumph of the revolution. Everything is immoral and criminal that hinders it. . . . He must penetrate everywhere, among the higher classes as well as among the middle—into the merchant's shop, into the Church, into the government offices, into the army, into the literary circle, into the detective force, and even into the imperial palace. . . . He must prepare a list of those who are condemned to death and despatch them in the order of their relative misdoings. . . . The most valuable element is women who are completely initiated and who accept our whole program. . . . All reasonings about the future are criminal, because they hinder destruction pure and simple, and fetter the progress of revolution."

He wished to destroy "all States and all churches, with all institutions and laws, religious, political, juridical, financial, magisterial, academical, economical, and social." He talked of "Pan-destruction," "perfect amorphism," "holy and wholesome ignorance." To attain to pan-destruction the first requisite accordingly was "a series of outrages and of audacious and even mad enterprises, striking terror into the powerful and arousing the people till they believe in the triumph of the revolution."

Such utterances are well called Nihilistic, and yet even Bakounin, at least in his earlier days, had a social ideal which he believed

would develop itself, could present forms be destroyed. He aimed at free autocratic communes, without law or government, but federated together in freedom and local self-rule. This idea was particularly acceptable in Russia, with its old ideals of the "Mir" (*q. v.*). Czardom was declared not Russian, but Tatar. For a long while the Nihilistic movement was divided between the Slavophilism of such teachers as Khomiakov and the internationalism of the more radical. The Slavophiles desired to break with Western ideas and develop these communistic national tendencies of "Holy Russia." Even Bakounin, in his early days, preached a strange mixture of Slavophilism and international anarchy. He took part in a "Pan-slavic" congress. Only gradually did he separate from this wing. But such writings as those of Bakounin, and such efforts as those of Netchaïeff, falling upon inflamed social conditions and students struggling with poverty, while fired with a spirit of self-sacrifice, could but result in terrible, fanatical, although heroic deeds. Thousands of young people went on a crusade among the people; at first peacefully, but gradually developing "the gospel of the deed." As early as April, 1865, Karakoff, a fanatic, had fired a shot at the Czar. The famous "third section" of secret police was then developed, with Peter Shouveloff as its chief, and the struggle between the Government and the Nihilists was begun. In 1873-74 some 1500 agitators and their friends were arrested. After some months' detention half were released, the rest being kept in solitary confinement for from two to four years, during which 73 died or lost their reason. In 1877 193 of them were tried and exiled, punished, or banished for ten years to

Terrorism.

Siberia. The wanton cruelty of the Government created the spirit of revenge. In 1878 Vera Zassulitch shot General Trepoff, who had ordered the flogging of a political prisoner. She did not deny her act, but for some reason was given a civil trial before a jury, and was acquitted and escaped to Switzerland. It was the beginning of the program of terrorism. A party had been formed whose organ, *Zemlia e Volia* (Land and Liberty), gave the motto to the party. This paper now accepted the terrorist program. Constant plots were laid and terrible deeds committed. Women were among the most prominent. Among these was Sophia Perovskaya (*q. v.*), of high birth and connected with prominent officials, who, nevertheless, after suffering many wrongs, became most active in Nihilist circles. She displayed the signal when Alexander II. was assassinated in 1881, and took part in the plot to blow up the railway train on which the Czar was to travel. This plot was only defeated by the Czar's having changed trains. After the Czar's assassination she calmly gave herself up to the authorities and was hanged. Other women were Vera Figner, who plotted the assassination of General Streenikoff at Odessa; Miss Ivanova, who with her pistol held the police at bay for hours, on their discovery of the secret printing office; the Soobotin sisters,

who masqueraded as spies and rendered the cause invaluable service till they were themselves discovered by real spies. These were but a few out of many. Gradually, however, the movement wore itself out in its intensest form. In 1880 the most energetic and numerous section of the Russian revolutionists proclaimed that their aim was the attaining of a constitution for Russia. This was the *Narodnaia Volia* party with the "executive committee" at its head; which may be considered the embodiment of Nihilism as understood abroad. The minority founded a paper called the *Tcherny Peredel*, which kept to a purely industrial policy, repudiating all interference in politics. The life of the paper was, however, soon cut short by the police. The *Narodnaia Volia* party thus formulated

its program: 1. A permanent representative assembly, having supreme control and direction in all general State affairs. 2. Provincial self-government, secured by the election of all public functionaries. 3. Independence of the village commune as an economic and administrative unit. 4. Complete liberation of conscience, speech, press, writings, association, and electoral agitation. 5. Manhood suffrage. 6. Substitution of the standing army by a territorial militia. 7. Nationalization of land. 8. A series of measures tending to transfer the possession of factories to workmen. The minority party, after the capture of its paper by the Government, started in Switzerland a paper, *The Social Democrat*, indorsing the program of the German socialists. This party has endured and is growing among the Russian working men. To-day, Nihilism can scarcely be said to exist in Russia. From 1862 to 1880, 17,000 men and women are said to have been transported to Siberia for political reasons. The present movement is purely socialistic. Says Stepniak (*New Review*, vol. x. p. 218): "Anarchy died in Russia in 1874, and was buried in 1877." A few Russians in exile still hold anarchistic views; but both out of as well as within Russia the friends of the movement are almost wholly socialistic. The Society of Friends of Russian Freedom in England is largely composed of socialists. The Russian Free Press Fund is largely under similar auspices. George Kennan says in his *Siberia* (vol. ii. pp. 430-432) that he "made the personal acquaintance of more than 500 of the anti-government party in Russia, including no less than 300 so-called Nihilists living in exile in the convict mines or penal settlements," and came to the conclusion that "there is no anti-government party to which the term Nihilistic can be properly applied. This may seem, perhaps, a very strange statement in view of the fact that we have never heard of any other anti-government party in Russia, but it is a true statement, nevertheless. There is no party in the empire which deliberately chooses violence and bloodshed as the best conceivable means of attaining its ends. There is no party which aims simply and solely at the overthrow of existing institutions, and there is no party that preaches or practises a philosophy of

mere negation or destruction, I make these assertions confidently because my acquaintance with the so-called Nihilists is probably more extensive and thorough than that of any other foreigner, and I have discussed the question with them for many hundred hours. Liberals, Reformers, socialist theorists of the Bellamy type, political economists of the Henry George type, Republicans, Constitutionalists, Revolutionists, Terrorists, I met in all varieties, both in European Russia and Siberia, but a Nihilist in the proper or even in the popular significance of that word—never."

NON-PARTIZAN TARIFF IDEA. See TARIFF.

NORTHAMPTON ASSOCIATION.—A non-religious community, organized April 8, 1842, located near Northampton, owning some 500 acres, a silk factory, sawmill, six dwelling houses, etc., valued in all at \$31,000. Its projectors were David Mack, S. L. Hill, George W. Benson, and William Adam. There were no "articles of faith," and very little to hold the community together. It dissolved November 1, 1846. The cause of the failure seems to have been mainly a debt incurred in part on the original capital, which finally proved too heavy to be carried.

NORWEGIAN COMPANY SYSTEM, THE.—The Norwegian company system for controlling the liquor traffic, like every other system, is a growth. Early in the century Norway and Sweden had a *per capita* consumption of spirits higher than any other civilized nation.

Climate and domestic and social habits had led the Scandinavians to believe that, in order to secure the necessary virility to resist the raw, elemental forces of nature, and in order to enjoy family and social relations, a bounteous supply of distilled alcoholic liquor was needful.

In Sweden all owners of the soil—and tenants even—had the right to distil and sell liquor, with practically no restraint or tax to limit the production.

In Norway the situation was but slightly—if at all—better. From 1845 to 1855 laws were passed in both countries forbidding free distillation and putting distilling under the control of the Government. This benefited some of the country communities, but not the cities and towns. In 1864 the editor of the Gothenburg *Chronicle* proposed to the municipal council to appoint a committee to examine into the extent and causes of pauperism. This was done.

This committee reported in April, 1865, attributed the city's pauperism and other evils to the brandy which the poor consumed, and suggested that the municipal authorities take advantage of a provision of the law of 1855,

hitherto not used, and hand over to a company, composed of 20 highly respected business firms and private individuals, the licenses for the bar sale of brandy,—then disposed of at auction to the highest bidder,—the company engaging in the business, *not for the sake of profit, but solely for the good of the working classes*, and the shareholders refusing to derive the slightest profit from the business beyond the ordinary rate of interest on the capital invested. In the

History.

italicized words may be found the unique, vital principle which differentiates the system from all other license systems.

The town council approved the recommendation and proposition. It was sanctioned by the magistrates. In August the royal assent to the company's statutes was received; and on October 1, 1865, the company began its operations, controlling 36 licenses. Later, 1875, the company secured control of the entire retail trade in spirits. In 1874-75, when Gothenburg had a population of 59,986, the bar trade in brandy amounted to 680,539 quarts per year, and the total consumption of spirits to 1,740,110 quarts. In 1891-92, with a population of 106,356, the bar trade in spirits had fallen to 548,071 quarts, and the total consumption of spirituous liquors to 1,523,251 quarts. Thus, while the population had increased 46,370, the consumption of brandy sold over the bar decreased 132,486 quarts, and the total consumption decreased 216,859 quarts.

Two movements followed naturally the introduction of the new system in Gothenburg.

1. Other towns and cities in Sweden imitated its example; and ere long the towns and cities of Norway followed suit, because, to quote the words of Dr. Sigfrid Wieselgren:

"The system put a stop to the illegal practise of selling brandy on credit; left it to the customer's own option to use the public-house as an eating-house; made drinking on the premises more difficult; limited the hours of sale, without the dealers being able to elude said measure or raise complaints against it. There was no fear of drunkenness being encouraged by too many or too few licenses, as the bar had the right of either using or leaving unused as many licenses as they considered desirable; no competition with other venders would oblige the company to put down their prices; and, as they disclaimed all profits from the traffic, that greed of gain which forms such a strong motive power in the dealings of most tradesmen could offer them no inducement to deviate from the principle on which the whole system was built—*i. e.*, not for individual gain, but for the welfare of the working classes."

2. The distillers began to plot against the law and the "company system"; for they saw in it the most dangerous assault upon their personal interests and income that they had ever known or imagined, since it threatened to and actually did decrease the demand for the product of their distilleries, and severed immediately that alliance between distiller and retailer—with the former as dominant partner—which, in England, has made so many "tied-houses" and in the United States has made most of the saloon-keepers simply agents or hirelings of the distillers or brewers, who establish and own a majority of the retail establishments.

But the system won. In 1875 it was made

entirely legal, tho not compulsory. It to-day prevails in Sweden in 78 towns out of 102. In Norway it was tried first in Christiansand in 1871. This is its record in Norway since that date: Shops for the sale of spirits, reduced from 501 to 227, or from 1 for every 591 inhabitants to 1 for every 1413 inhabitants. Or, including the village retail shops and the licenses held by men who have a life interest, only 304 places in Norway where spirits are sold over bars; *i. e.*, about one place for every 6600 inhabitants.

Consumption of spirits (50 per cent. alcohol) has fallen from 6.8 quarts per inhabitant in 1876 to 3.3 quarts per inhabitant in 1892, which is 2.7 quarts less than the consumption in the United States, and entitles Norway to be ranked as second only to Italy among European nations for temperance.

Mr. Berner, the eminent Norwegian banker and temperance leader, said at the Hague Congress in 1892:

"There is now no longer anybody in these three countries [Sweden, Norway, and Finland] who doubts that the entire traffic in spirits will soon be intrusted to the authorized companies, and the yet remaining specimens of the old tavern vanish entirely. In Norway, at all events, the question in the future will not be whether the municipal authorities in towns shall transfer the trade in spirits to authorized companies or to ordinary shopkeepers, but whether there shall be authorized companies for the sale of spirits or the sale entirely forbidden. . . . In the future they [the companies] will have the monopoly of the spirit trade, or, at all events, have the limit raised to 250 liters, as in Sweden, or to 400 liters, as in Finland. Not before the control of the authorized companies' arrangements shall have embraced the whole of the traffic in intoxicating liquor, at least the most considerable part of it, will the beneficial effects fully appear, and Norway occupy a still more prominent position among the lands of sobriety than she already does."

Results.

Since he uttered these words his predictions have been realized. The Norwegian law of July 24, 1894, raises the minimum wholesale limit from 40 to 250 liters (42 to 264 quarts); and permission to engage in the wholesale trade, formerly open to all distillers and all general tradesmen, is now restricted. A direct local option system is established, and the women have been given a vote. The voters must choose between the company system and prohibition. Higher rates of duty have been imposed on the high-grade liquors made abroad, and it has been made more difficult for foreign agents to sell their goods. A royal commission has reported favoring the taxation of beer production according to the percentage of alcohol contained, and at the last meeting of the Norwegian Total Abstinence Society, this last suggestion, and the extension of the company system to include a monopoly of the sales of beer and wine, were made planks in their platform, for the enactment of which they will make their next assault on the Norwegian legislature.

But this is not all. The number of distillers has been greatly reduced (*only 23 in 1893, while in 1833 there were 927*); the tax has been raised from 3½ cents in 1849 to 52.9 cents per liter in 1894; and to-day, while England derives about one-fourth of her revenue from excise duties, and the United States about one-third from internal revenue duties on distilled and fermented liquors, Norway's revenue from the

same sources is scarcely one-tenth of her national income.

Says an advocate of the system, concerning another point:

"Not failing to note that the shareholders in the Bergen Company in 1893 included 38 merchants, 7 lawyers, 4 head-masters of schools, 2 school superintendents, 8 consuls representing foreign countries, 12 physicians, besides manufacturers, bankers, brokers, army officers, and government officials; let some of the acts of what may fairly be described as a typical Norwegian company be noted, and contrasted with what we know of the liquor-dealers operating under our present license system.

"After receiving 5 per cent. interest on their shares, and accumulating a reserve fund equal to their original capital, and paying to the municipality the fees for the licenses which the company controls, what have the profits been, and where have they gone? From 1878—when the company first had a surplus to divide—to 1890 the total profits of the Bergen Company were \$348,655, which were divided and distributed, not in ways that corrupt politics and debauch individuals, but among objects of public utility and beneficence, as shown by the following analysis of the division of the profits of the Norwegian companies in 1891:

1. General charity, charitable institutions, and sanitary improvements.....	\$74,793.80
2. Parks, tree-planting, and highways (for pleasure).....	63,639.01
3. Industrial and professional education....	58,590.81
4. Water-works, sewers, and other municipal objects.....	49,743.38
5. General educational purposes (public school buildings, libraries, etc.).....	39,694.92
6. Theaters, public amusements, and artistic objects.....	37,968.90
7. Organizations not of a specifically charitable nature.....	15,322.51
8. Religious objects.....	9,506.22

One of the chief results is the control of the saloons. Bars are open on week-days from 9 A. M. to 12 M., and from 1.30 to 8 P. M. On Sundays and holidays they are not open, and on the days preceding Sundays and holidays they close at 1 P. M. Liquor may only be sold in the company's glasses and for cash. Liquor may not be served to intoxicated people or in quantities to intoxicate. Lounging and staying on the premises are forbidden. Children and apprentices are not allowed entrance.

Professor E. R. L. Gould, summing up the advantages of the company system as administered in Norway and Sweden, gives prominence to the fact that there has been a marked improvement in the character of the saloons; immoral accessories having universally disappeared. The police authorities have uniformly availed themselves of the right, through the contracts made by the companies with sublicensees, to impose conditions which put an effectual stop upon gambling or immoral practises in places where liquor is sold. Professor Gould also refers to the sublicensees issued to hotels and similar places where such vices might be fostered. But the management of the company stores is such that, by reason of their location, publicity, strictly enforced rules of conduct, and management by employees who have no personal profits to make from the sale of liquors to gamblers and prostitutes, the connection becomes improbable, if not impossible.

The last legislation in Norway, July 24, 1894, gives all men and women over 25 years of age the right to vote to exclude the retail bar traffic in spirits from the community in which they reside. This is a great advance over all

previous legislation, and is hailed with joy by Norwegian temperance leaders; and this was made possible, as Mr. Berner, the chairman of the Norwegian Royal Commission which reported this new law, said, by the fact that because of the "company system" the liquor influence was out of politics.

OBJECTIONS.

The Norwegian company system is objected to by various thinkers, on various grounds. It is objected to by most Prohibitionists on the ground (1) that it will check the growth of the no-license movement. In prohibition and the education gained by the steady contest for it, lies, in their opinion, society's main hope. Let the company system once be established, and this movement will be checked. It has so worked, they claim, in Sweden. Local prohibition, they assert, had gained considerable ground there in 1855. Says a no-license advocate:

Delays No-License.

"Dr. Wieselgren says, 'Before 1855 brandy could be bought in almost every cottage. In 1856 one might travel through whole provinces without finding a single place where it was sold.' Here we see the result of no-license or local prohibition. But the cities and towns would not accept local option. 'Here the drink evil continued its ravages unabated.'

"And now mark what was done. Instead of promoting total abstinence and adopting local prohibition as was done in the county districts, they instituted the Gothenburg system . . . not as a step toward prohibition or no-license, but away from it. 'The working classes' were becoming paupers, and the rich were taxed for their support. So this system was instituted, not to interfere with drinking in general, but to promote moderation among the working classes and let them drink for the public good by having the profits go to reduce taxation. The aim was not even ultimately a prohibitive one, but an attempt at a better control of the sale of spirits. In Norway its origin, purpose, aim, and results were similar.

"What have been the results as to prohibition or local option?

"Of the 102 towns and villages in Sweden only two enjoy no-license.

"Nearly every town in Norway has a liquor company.

"No single community, so far as has been learned, which has ever once tried the system has afterward abandoned it. . . . From the temperance view of the case, it is feared that the upper classes of society do not wish to go further than the Gothenburg system. Some of them would not like to see the drinking of spirits made unrespectable. Consequently a practical difficulty may be raised in the future, should it come to a choice between the company system and prohibition. Furthermore, it is feared that municipalities will not willingly surrender the revenues now accruing from the companies' profits. Should these decline largely, it is also held that philanthropic motives may be put in the background" (*Gould's Rep.*, p. 242).

(2) The Prohibitionist opponents of the Norwegian system deny that it has even decreased drunkenness. They admit a decrease in drunkenness over former times before the temperance movement, but this they say is due not to the company system, but to the prohibition movement, and within recent years they say drunkenness has not decreased, but increased. On this point they quote from H. E. Berner of Christiania, Norway, a director of one of the companies and a prominent believer in the system, who says (*Report of Dr. E. R. L. Gould*, p. 218):

"It had been noticed at the session of the last alcohol congress that previous to the years 1888 and 1889 a slight increase in the consumption of brandy had taken place. But as yet this increase was comparatively insignificant, and, furthermore, people must always be prepared for fluctuations in the consumption of alcohol. Hence the increase might be regarded as of no importance, and we might hope that it would be supplanted by a steadily continued and lasting decrease in the consumption of intoxicating drinks. But in the face of the more accurate statistics, including those for the last five years, which can now be presented, it is impossible to rest in the hope that conditions will improve. The language of figures is incontrovertible, and it speaks loudly of a steady and very marked increase of drunkenness in Norway during these last years." Then, after giving the figures of brandy consumption for 1887 to 1891, inclusive, he says:

Increase of Drunkenness.

"This is quite an even and alarming increase for the five years. One must go back to the seventies to find such a consumption of brandy as that for 1891." Then, after noticing the enormous increase in the consumption of beer during the same period he continues: "This large increase in the consumption of intoxicating drinks, which cannot be explained by passing or outward circumstances, seems not yet to have reached the limit. We must be prepared for a further decrease in sobriety."

From the report of the Massachusetts Commission on the subject they quote:

In all Sweden the consumption of brandy increased from 6.5 quarts per inhabitant in 1889, to 6.8 in 1892 (H. R. 77), and of beer from 17.2 in 1880 to 28.2 in 1890 (B. R. 80). In Norway, brandy from 2.8 in 1887 to 3.3 in 1892 (B. R. 135), and beer from 18.7 in 1887 to 31.2 in 1891 (B. R. 140). The report says, "The [beer] figures for 1892 were not attainable, and will most likely show a continued increase." Taking the beer and brandy together, the report shows an increase of 13 quarts per inhabitant in five years. In Christiania, Norway, the total average consumption of distilled liquor per inhabitant was, according to the report (p. 126), in 1885, 2.22 quarts; 1887, 2.28; 1888, 2.56; 1889, 2.77; 1890, 2.64; 1891, 2.63; 1892, 2.69.

They also quote, from the same report, increase in arrests for drunkenness. According to this, in Gothenburg the arrests for drunkenness per 1000 inhabitants were in 1885, 29; 1886, 31; 1887, 32; 1888, 31; 1889, 34; 1890, 40; 1891, 44; 1892, 42 (p. 53).

In Christiania, Norway, the arrests for drunkenness were, 1886, 25.6 per 1000 inhabitants; 1887, 28.3; 1888, 40.6; 1889, 41.2; 1890, 51.9. The percentages for 1891 and 1892 are not computed, but as the totals are much greater than for 1890, the percentages are no doubt greater, and the fact that they are not computed is significant (B. R. p. 127).

(3) The objectors urge that by no means all in Norway believe in the system, while many who have investigated the system have rejected it. Says one objector:

"Although instituted in Gothenburg, Sweden, in 1865, and, with slight modifications, in Norway in 1871, this system has not been adopted in any other country except Finland.

Opposition.

Why is this, when we consider that only a narrow sea separates Scandinavia from Great Britain, a country alive with temperance sentiment, the home of great temperance societies eager to adopt wise temperance legislation?

"It is because Scotland and England have investigated and condemned the system."

"At the World's Temperance Congress in Chicago in 1893 the system was condemned by eminent temperance reformers who were familiar with its workings in both Norway and Sweden. No one commended it."

The *Philanthropist*, the organ for Norway's total abstinence society, says in speaking of Dr. Gould's report:

"The statistical figures are about right, but the understanding of the workings of the system rests on a misunderstanding that is easy to forgive. Dr. Gould seems to give the company system all honor for the increasing sobriety, and says that the system has diminished temptation to drunkenness; that per-

sons under eighteen years cannot buy liquor, and that the foremost temperance men think the system will lead to absolute prohibition. For us Norwegians this appears to sound a little strange. Most of us here [in Norway] know very well that the honor for the increased sobriety belongs not to the company's system, but to the temperance workers, dissenter churches, and the better education of the people. Dr. Gould points out Christiania and Bergen. It is irony when the report says that the system has lessened 'the temptation to drunkenness.' Those familiar with the facts know that the company's shops (in Christiania and Bergen) must tempt to drunkenness, and so also in other places. The company's shops are located about the open places or at the corners of several streets. The company in Bergen has not been ashamed to largely advertise their products. That persons under eighteen years cannot buy liquor is directly wrong, because there is worse beer and liquor sold to such and still younger."

(4) The supreme objection to the system on the part of many who are not Prohibitionists, as well as on the part of many who are, is the profits in it to the community and the making of the traffic respectable. Says Lewis A. Bailie of Edinburgh, who investigated the system:

Public Profits.

"The fact that the traffic had been transferred from private liquor-sellers to a corporate body I found had tended to throw around it an air of respectability which it did not hitherto possess. When it is pointed out that many members of the company were gentlemen of the highest moral and Christian character, who disclaimed all profit from the exceptional business other than 5 per cent. for the capital invested, it will be easily understood that the habit of drinking under such highly respectable conditions by young men and the working community generally was divested of much of its doubtful character."

Of the profits in the system, Mr. J. G. Brooks (a believer in the system) says in his article in the *Forum* (December, 1892):

"But no fair judgment of this whole matter can be formed without dealing unflinchingly with certain limitations, dangers, and positive weaknesses. The master stroke, as we have seen, lies in depriving the individual of profit; but the temptation to have much liquor sold is not therefore removed. We have only substituted a *group* selfishness for an individual one. It is still for the direct advantage of the taxpayers in the community to have the proceeds from liquor sales as large as possible in order that taxes may be lower. I heard a rich Swede discourse at a sumptuous dinner over his bottle of champagne upon these 'proofs of success.' 'We raise our taxes without any difficulty,' he said. It needs no illustration to show what a subtle and all-pervading force of temptation is here brought to bear upon the average citizen. That the danger is real, not in theory alone, but in fact, no one will deny who has studied the situation. Is the selfish advantage of a collective body less dangerous than that of the single individuals who compose the body? No calculations other than speculation are here possible. That so direct an interest of the group is a danger will not be questioned."

It is because of these evils that many radical temperance reformers prefer the nationalization plan, which would do away with all profits. (See NATIONALIZATION OF THE LIQUOR TRAFFIC.)

(5) Many objectors to the system deny that it will divorce the liquor interest from politics.

Even Dr. Gould says, in the *Atlantic Monthly* for October, 1893:

"Here is the great difficulty. The standard of municipal politics in this country is not what it is in Scandinavia, and this, in the light of what has been said of the intimate relation existing between the companies and the local government, apparently offers an insuperable objection. Many would think it better to leave undisturbed the present unholy alliance than that liquor and politics should be more closely wed."

Liquor in Politics.

Again he says, in the *Forum* for March, 1894 :

"Will the Gothenburg system flourish, or can it even thrive in so tainted a political atmosphere as that surrounding American municipal government? This is almost the first expression of the honest doubter. He thinks that the bad state of politics precludes successful operation of the system because of the necessarily intimate alliance liquor companies must sustain to local authorities. Can the body which must act both as licensing authority and in a sense as a board of control be constituted so as to insure fair dealing and a safeguarding of the public interests from their moral side? Judges in courts of higher instance, who would certainly be the most competent and fair-minded individuals, are disinclined to serve. A commission with final authority, appointed by governor or mayor, or even specifically elected by the community, might not be safe repositories of this authority. How is the difficulty to be gotten over? . . ."

OBJECTIONS CONSIDERED.

Many of the objections are said by the believers in the system to be not inherent in the system, but due to defects which could be remedied.

Professor Gould, in his report to the United States Department of Labor, when he came to sum up the advantages and disadvantages of the system, held that the disadvantages, for the most part, were due to defects in existing law rather than any inherent weakness in the system itself. Proceeding to describe the disadvantages, he naturally referred first to the fact that, "in order to achieve the maximum of benefit, fermented drinks must be included as well as spirituous." Both Sweden and Norway recognize this now, and Norway has begun to legislate in this direction. To this absence of control over the sale of fermented liquors and the permitting of sublicensees, the best authorities in Norway attribute much of the existing drunkenness there.

"A legal defect applicable to Norway is found in the limit for retail sales, which is not fixed high enough," says Professor Gould. Norway, since Professor Gould wrote the above, has, however, recognized the force of this indictment and remedied it in the law of July 24, 1894, in which the minimum wholesale limit is raised from 42 to 264 quarts.

"The third defect in Norway is that at present the retail sale of wine and beer in towns and country districts is conducted with general business." By the law of July 24, 1894, Norway prohibits the granting of licenses for bottle trade in the country districts.

To the charge of increased arrests for drunkenness, a defender of the system says :

"If it be recalled (1) that increase of public sentiment in favor of temperance always brings with it an increase of official vigilance and arrests, as witness the increase of arrests in the 'No-License' cities of Massachusetts—an increase, proportional to the population, over the number of arrests during the license régime much greater than the increase in the Scandinavian cities; and (2), that the cities of Scandinavia, like those of Massachusetts, as they are being surrounded by an ever-increasing area of prohibition in the adjoining rural districts to which they are being united by rapid and cheap transit facilities, have to bear a larger and larger proportion of the burden of arresting and punishing those who seek the cities for intoxicants—it might be questioned, without any further investigation, whether an increase of arrests in any such Scandinavian city could fairly be said to be due to a failure of the company system.

"Moreover, when it is remembered that a large part of whatever recent drunkenness there may have been in Scandinavia has been caused by the use of fermented drinks, which has increased there, as it has to a much greater degree in the United States and elsewhere in the world, and over which the companies have no control, it becomes clear that the failure of the system cannot be proved by these allegations of increased arrests or increasing drunkenness.

"The testimony of students of actual conditions in Scandinavia is that the increase of drunkenness has been due to the increase of consumption of fermented liquors, and to causes over which the companies now have no control."

Mr. Berner, *et. g.*, whom the objectors to the system quote as to the increase of drunkenness, is a strong advocate of the system and believes the increase to be due to a too limited control of the company system over brandy sales.

Dr. E. R. L. Gould says on this point, in the *Forum*, March, 1894:

"Will this new system of liquor traffic reduce inebriety? Its opponents have not hesitated to answer in the negative, and in justification point to the statistics of Sweden, which show that in recent years there has been an increase in the number of convictions for drunkenness. This is true, but during the same time there has been an immense decrease in the *per capita* consumption of spirits. Are we, therefore, to infer that decreasing consumption means additional drunkenness? Furthermore, during this period, prohibition has been introduced into almost all of the country districts of Sweden. Singularly enough, the ratio of increase in drunkenness in the country has been greater than in the cities and towns. Does it, therefore, follow that a prohibitory régime is favorable to the increase of drunkenness? The truth of the matter is that no reliable inference as to the efficacy of a system of control can be gathered from the study of these statistics. The number of persons who touch liquor at all might fall one-half, but if old toppers continue to drink, as they will, there will still be practically the same number of 'drunks' as before. Again, legal regulations, activity of the police, and even the employment of patrol wagons, are important factors, though usually quite neglected. The true explanation, as regards Norway and Sweden, is quite simple. While the consumption of spirits has been envied with difficulties, beer-drinking has been, one might almost say, encouraged. Hence, the consumption of malt liquors has risen to colossal figures, in comparing recent with previous years. Simultaneously the beer has been strengthened and cheapened. The companies refuse to sell further portions to a customer giving evidence of intoxication, but the vender of beer will supply as much as his client wishes.

**Per
Capita
Decrease.**

"The folly of making so sharp a distinction in the control of spirituous and malt beverages is evident. As compared with the period before the Gothenburg system went into effect in Scandinavia, the decrease in drunkenness is enormous. Progress continued in the right direction until beer commenced to be generally sold. The Swedish Government, on the 20th of last June, took the first step in recognition of this view by limiting the free sale of malt beverages to a minimum of 10 liters at one time."

As for the objection that some Prohibitionists in Norway, and almost all elsewhere, have condemned the system, it is answered that in Norway most of the temperance believers do indorse the system, while in other countries the system is rapidly growing in favor, even among strong Prohibitionists.

As for the fear of the liquor interest in politics, Mr. J. G. Thorp, Jr., says (*The Temperance Cause*, February, 1895):

"What puts liquor into politics? Does any one question that it is the enormous profit that can be made of it? Or can any one successfully dispute the proposition that in so far as private profits can be taken out of the business, to that extent at least liquor will be taken out of politics? Does any intelligent man question that the saloon, as it now exists, is not only a source of moral degradation to individuals, but a center of political corruption also? If the saloon, as a rendezvous of political heeleders and the worst features of the machine in politics, can be done away with, can any one doubt that much of liquor will be taken out of politics? That all this can be done at once no one contends; and that the establishment of this system will bring against it all the forces of the liquor organizations in attempts to overthrow it and to corrupt and control those called upon to administer it in the public interest, there can be no doubt. Such

**Politics
Divorced
From Liquor.**

is the teaching of its history in Scandinavia, a history which is already repeating itself here in the attempt of the liquor organizations to defeat the Norwegian bill; but the same is true of prohibition and of all proposed forms of legislative control, except that the liquor attack will be more bitter upon the company system since it has more to fear from it. This opposition has been withstood in Scandinavia. Shall we admit that we have less public virtue and power to overcome these forces of evil? I think not."

Of the danger of making the traffic respectable and of the communities getting profits from it, the defenders do not deny the danger, but argue that the system of private profit is incalculably worse: that to sell without profits (the Nationalization plan, *q. v.*) would be to increase intemperance by lowering the cost of drink, and that until the traffic can be prohibited, it is well that it should be made to pay the cost of enforcing laws, etc.

To the objection that the system will delay the adoption of prohibition, Dr. Gould says (*The Temperance Cause*, February, 1895, p. 4):

"Undeniably strong evidence of the efficiency of the Scandinavian method of controlling the liquor traffic is that no single community which has ever tried it has afterward abandoned it. An attempt has been made by unfriendly critics to turn this argument into an admission that the system, once introduced, cannot be gotten rid of or replaced by anything better. This is a gross perversion of facts. The system remains because communities have found it such a vast improvement on the old individual licensing plan. Publicly expressed approval of leading temperance reformers, indeed of all intelligent classes, as has been already shown, amply proves our contention. It is certainly an open question whether local prohibition under a local option system, as we understand it, would do better in any of the larger communities of Scandinavia, given existing views and contemporary social conditions; but the new law of Norway—which for the first time in Scandinavia gives adults over 25 years of age, including women, the right to vote directly on the question of license—will soon answer the hypothetical objection raised."

On this point Mrs. Mary A. Livermore writes to J. G. Thorp, Jr.:

"My Dear Sir: First, last, and always, I am a Prohibitionist; and I favor the Norwegian bill because, if righteously administered, its tendency will be toward prohibition. If our good temperance people would carefully study the bill, I think their objections to it would disappear. For, if the bill is carried, we shall continue to have 'local option' in Massachusetts, and the same proportion of towns and cities voting No-License that we now have.

"But in the towns and cities that vote for license the Norwegian system offers a chance for great improvement. It can only be adopted in those places by a majority vote. But, then, it eliminates the element of personal profit from the sale of liquor, which now keeps it alive and makes it flourishing.

"It extinguishes the saloon as it now exists, a noxious agent in politics, the headquarters of a most dangerous class, and a perpetual menace to the community. And it transfers the control of liquor-selling from the very worst elements of society to the hands

of men who abominate the whole business, and only consent to take charge of it that they may minimize its evils and ultimately extinguish them. I don't wonder that the liquor-selling fraternity fight the bill. But I do wonder that our honest, straightforward temperance people cannot see the power it gives them."

The best answer, however, to the objections is what the system has accomplished in Norway:

(1) It has reduced the number of places licensed to sell spirits in the cities from one for every 501 inhabitants to one for every 1413. In the country districts only 25 license places remain, or one to about 8000 inhabitants:

(2) It has been the main factor in reducing the consumption of spirits one-half.

(3) It has driven out the saloon as the center of the ward heeler and the political machine and the approach to every form of vice.

(4) It has crushed the ruinous credit system.

(5) It has reduced the hours of sale to a point not approached elsewhere.

(6) It has surrounded the sale by the best restrictions and regulations which good men can devise.

(7) It has driven the retail seller of spirits for private gain out of Norway.

Concurrently with all this, accomplished in the larger centers of population where liquor is sold,

(8) Prohibition has prevailed generally in the country districts, and a temperance sentiment has been developed which, unhindered by powerful liquor lobbies using private profits to prevent restrictive legislation, could secure the passage last July of a law creating a local option system as complete as that possessed by us, which gives, as Massachusetts does not, to every man and woman of 25 years of age or over, the right to vote, not as here on the issue of No-License or license for private gain, but on the issue of No-License or license under the company system.

(9) No country in the world can show more advanced temperance thought, such extraordinary progress, or so remarkable a record in temperance legislation.

Report of the Massachusetts Legislative Commission to investigate the Gothenburg System, January, 1894. Articles by Dr. Gould in the *Forum*, March and November, 1894, and Professor J. G. Brooks in the *Forum*, December, 1892. For the opposing view see the *Temperance Cause*, the organ of the Massachusetts Total Abstinence Society, January, 1895.

NOYES, JOHN HUMPHREY, was born at Brattleboro, Vt., in 1811. Under the Finney revival he became converted, and studied theology at Andover and at New Haven. In 1834 he became a Perfectionist, and began to teach and preach at Putney, the residence of his father and family. Gradually a school of fellow-believers gathered around him. During the Fourierist period, 1840-48, Noyes studied communism. At the end he began to preach a type of communism at Putney, but the spirit of the place was too orthodox, and it resulted in his starting the Oneida community, with which his name has been since connected. (See ONEIDA COMMUNITY.)

Results.

OASTLER, RICHARD, was born in Yorkshire, near Huddersfield, in 1789, and succeeded his father as steward to Mr. Thornhill, living at Tirby Hall. He early became interested in the abolition movement; but while advocating the abolition of slavery abroad, he suddenly became aware that there were slaves in England. He learned that there were children beaten and overworked that large profits might be made by the manufacturer, and he lost no time in entering upon a warfare against such wrongs. In a letter to the *Leeds Mercury*, in 1830, he exposed some of the evils existing in the neighboring mills. Out of this grew a spirited controversy from which he emerged triumphant, his statements being proved by evidence from every part of Yorkshire. Agitation was aroused in Lancashire, also, and as a result a bill was laid before Parliament by Lord Morpeth, for limiting the hours of work and raising the limit of age for work in the mills. But the opposition of manufacturers was very bitter, and they succeeded in getting the bill amended so that it was almost useless. Calumny was heaped upon Oastler, but he did not swerve from his course. His advice to the working classes was "Let your politics be 'ten hours a day and a time book.'"

Oastler now became associated with T. Hobhouse and M. T. Sadler (both members of Parliament) and others; and, by agreement, in 1831, Sadler introduced a ten hours bill into the House of Commons, and made a forcible speech in its support. The bill, however, did not pass, and in the election of 1832 Sadler lost his seat in Parliament.

Another leader, however, appeared. This was Lord Ashley, afterward Earl of Shaftesbury, who took up the ten hours bill. The mass of testimony which Oastler had produced showed that it was the custom to employ children from five year old upward, from five in the morning till ten at night, and that during the whole time they were on their feet, with a short interval for dinner. These children were very cruelly treated, and were beaten for mistakes. Several cases of death resulting from such beatings were proved. Such evidence as this induced Lord Ashley to take up the cause. He was assisted by the report of the commissioners that a case had been made out for the interference of the legislature, and he brought in a ten

hours bill for women and children, on June 17, 1833. A Government bill was, however, finally introduced, and accepted by Oastler and Lord Ashley, as the best that could be procured then. While it did a certain amount of good, it permitted manufacturers to act as justices and punish offenses committed by members of their own body; and, naturally enough, punishments were few, while infractions of the act were many. The law was so openly disregarded that Richard Oastler began his campaign afresh. Short-time committees were once more organized in the Yorkshire towns. Letters were sent to the papers by Oastler and his friends, and great enthusiasm was aroused among the working classes of the North. The cry went forth, "Yorkshire slavery still exists." As a result of the agitation the Government was finally obliged to promise to do its best to enforce the factory acts.

In the midst of his great work Oastler was suddenly cast into prison for a debt which had been incurred in keeping up his position and pursuing his labors. From the Fleet prison he each week issued a journal called *The Fleet Papers*, devoted to a discussion of factory and poor-law questions. After five years' imprisonment his friends subscribed enough to clear him from debt, and he was released. His entry into Huddersfield was made a great public event, and crowds of people thronged to greet their liberated champion, with music, banners, and processions.

Oastler's final victory, however, was gained in 1847 by the passage of the Ten Hours Bill of that year. The old song had come true:

"We will have the Ten Hours Bill;
That we will, that we will!"

Oastler's wife died soon after his release from prison, and his remaining years were passed in seclusion and poverty. He died in 1861 at the age of seventy-two. The Old Factory King, as his admirers called him, is an example of self-sacrifice and devotion to the cause for which he entered.

OCCUPATIONS.—The number of persons, both male and female, engaged in gainful occupations in 1890, in the United States, according to Bulletin No. 99 of the Eleventh Census, was as follows:

STATES AND TERRITORIES.	POPULATION 10 YEARS OF AGE AND OVER.			ALL PERSONS IN GAINFUL OCCUPATIONS.		
	Total.	Males.	Females.	Total.	Males.	Females.
The United States.....	47,413,559	24,352,659	23,060,900	22,735,661	18,820,950	3,914,711
North Atlantic Division.....	13,888,377	6,904,566	6,983,811	6,971,460	5,543,030	1,428,430
South Atlantic Division.....	6,415,921	3,177,689	3,237,152	3,118,056	2,431,744	686,312
North Central Division.....	16,909,673	8,827,083	8,081,530	7,673,898	6,661,082	1,012,756
South Central Division.....	7,799,487	3,977,614	3,821,873	3,635,814	2,973,003	662,811
Western Division.....	2,400,161	1,463,627	936,534	1,336,493	1,212,061	124,432

The following statement shows the distribution of the whole number of males and females, engaged in gainful occupations according to

the number and percentage in each class of occupations :

CLASSES OF OCCUPATIONS.	BOTH SEXES.		MALES.		FEMALES.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
All occupations.....	22,735,661	100.00	18,820,950	100.00	3,914,711	100.00
Agriculture, fisheries, and mining.....	9,013,201	39.64	8,333,692	44.28	679,509	17.36
Professional service.....	944,323	4.15	633,641	3.36	311,682	7.96
Domestic and personal service.....	4,360,506	19.18	2,692,820	14.31	1,667,686	42.60
Trade and transportation.....	3,325,962	14.63	3,097,653	16.46	228,309	5.81
Manufacturing and mechanical industries..	5,091,669	22.40	4,064,144	21.59	1,027,525	26.25

The following statement shows the percentage of males and females of the whole number of persons engaged in gainful occupations, and in each class of occupations, respectively :

CLASSES OF OCCUPATIONS.	MALES.	FEMALES.
	Per cent.	Per cent.
All Occupations..	82.78	17.22
Agriculture, fisheries, and mining.....	92.46	7.54
Professional service.....	66.99	33.01
Domestic and personal service.....	61.75	38.25
Trade and transportation.....	93.14	6.86
Manufacturing and mechanical industries.....	79.82	20.18

The numbers in the separate trades and occupations were as follows :

OCCUPATION.	Total.	Males.	Females.
All occupations.....	22,735,661	18,820,950	3,914,711
Agriculture, fisheries, and mining.....	9,013,201	8,333,692	679,509

a In agricultural districts "agricultural laborers" are often reported simply as "laborers."

b Farmers' wives, sons, and daughters, working in common and without stated remuneration, especially in the Southern States, are often reported as "farmers," and so tabulated.

c Frequently returned as "sailors." In many cases where the avocation is followed for only a portion of the year they are reported under some other branch of industry.

d Includes "turpentine farmers" and "laborers" principally found in a few of the Southern States.

e Includes national, State, county, city, and town governments.

f Includes paid housekeepers in private families, hotels, etc., matrons in public and private institutions, and stewards and stewardesses.

g "Sailors" at sea are liable to be omitted unless they are actual members of families which are enumerated.

h Includes bookkeepers and accountants of all kinds, irrespective of where they may happen to be employed.

i Includes clerks and copyists of all kinds, irrespective of where they may happen to be employed. See "Stenographers and typewriters."

j See "Steam railroad employees (not otherwise specified)."

k Includes officials of mining and quarrying companies, classified in 1880 with officials of manufacturing companies.

l See "Locomotive engineers and firemen."

m Generally reported as blacksmiths, carpenters, iron and steel workers, machinists, painters, wood-workers, etc.

n See "Molders" and "Metal-workers (not otherwise specified)."

o The unskilled workmen are often reported as common laborers.

p See "Woolen-mill operatives" and "Mill and factory operatives (not specified)."

q Generally reported as blacksmiths, carpenters, iron and steel workers, machinists, painters and varnishers, upholsterers and trimmers, wheelwrights, wood-workers, etc.

r The unskilled workmen are often reported as common laborers.

s See "Printers, lithographers, and pressmen."

t See "Print-works operatives" and "Mill and factory operatives (not specified)."

u See "Saw and planing mill employees."

v See "Meat and fruit packers, canners, and preservers."

w Includes employees of foundries, furnaces, and rolling mills. See "Metal-workers (not otherwise specified)," "Molders," "Nail and tack makers," and "Stove, furnace, and grate makers."

x See "Fish curers and packers."

y Includes textile mill operatives (not otherwise specified), and also mill and factory hands for whom the specific branch of industry was not reported.

z See "Piano and organ makers and tuners."

aa See "Iron and steel workers" and "Metal-workers (not otherwise specified)."

bb See "Musical-instrument makers (not otherwise specified)."

cc See "Compositors" and "Electrotypers and stereotypers."

dd See "Cotton-mill operatives" and "Mill and factory operatives (not specified)."

ee See "Door, sash, and blind makers."

ff See "Sewing-machine operators," "Shirt, collar, and cuff makers," and "Tailors and tailoresses."

gg Generally reported as cabinet makers, iron and steel workers, machinists, wood-workers, etc.

hh See "Seamstresses," "Shirt, collar, and cuff makers," and "Tailors and tailoresses."

ii See "Seamstresses" and "Sewing-machine operators."

jj See "Mill and factory operatives (not specified)."

kk Generally reported as blacksmiths, machinists, etc.

ll See "Carpet makers," "Hosiery and knitting mill operatives," and "Mill and factory operatives (not specified)."

Says the *Bulletin*:

"In order to compare the results for 1880 by classes of occupations with similar results for 1890, certain changes are necessary to be made in the classification of occupations at that census in order to conform to the classification used in the census of 1890. These changes are summarized as follows:

"First, by the transfer to 'Agriculture, fisheries, and mining' of fishermen and oystermen, lumbermen, and raftsmen, miners, quarrymen, and wood choppers, to the number in 1880 of 334,131 in all, from 'Manufacturing and mechanical industries.'

"Second, by the transfer to 'Domestic and personal service' of saloon keepers and bartenders, stewards and stewardesses, and employees in warehouses, to the number in 1880 of 75,766 in all, from 'Trade and transportation,' and of engineers and firemen, to the number in 1880 of 79,628, from 'Manufacturing and mechanical industries.'

"Third, by the transfer to 'Trade and transportation' of collectors and claim agents, auctioneers, livery stable keepers, clerks and copyists not otherwise described, clerks in government offices, clerks in hotels and restaurants, hostlers and messengers, to the number in 1880 of 119,671 in all, from 'Domestic and personal service,' and of clerks and bookkeepers in manufacturing establishments and of rag pickers, to

the number in 1880 of 12,320 in all, from 'Manufacturing and mechanical industries.'

"Fourth, by the transfer to 'Manufacturing and mechanical industries' of whitewashers, to the number in 1880 of 3316, from 'Domestic and personal service.'

"The differences, therefore, between the totals used in this bulletin and those given in the printed census report for each class of occupations in 1880 are as follows: An increase of 334,131 in 'Agriculture, fisheries, and mining,' or a total of 8,004,624 instead of 7,670,493; a net increase of 32,407 in 'Domestic and personal service,' or a total of 3,503,443 instead of 3,471,036 (exclusive of 603,202 persons engaged in professional pursuits); a net increase of 56,225 in 'Trade and transportation,' or a total of 1,866,481 instead of 1,810,256, and a net decrease of 422,763 in 'Manufacturing and mechanical industries,' or a total of 3,414,349 instead of 3,837,112.

"Corresponding changes have been made in the totals given in the printed report under each class of occupations in 1880 for males and females, respectively.

"There has been no change in the classification of persons engaged in professional pursuits, given in 1880 under the heading of 'Professional and personal service,' but they have been classified in 1890 under the heading of 'Professional service,' separate from persons engaged in 'Domestic and personal service,' as designated in 1890.

"The following table shows the number of persons of each sex engaged in gainful occupations and in each class of occupations in 1890 compared with similar figures for 1880, together with the number and percentage of increase during the decade:

SEX AND CLASSES OF OCCUPATIONS.	1890.	1880.	INCREASE.	
			Num'br	Per ct.
All occupations...	22,735,661	17,392,099	5,343,562	30.72
Males.....	18,820,950	14,744,942	4,076,008	27.64
Females.....	3,914,711	2,647,157	1,267,554	47.88
Agriculture, fisheries, and mining.....	9,013,201	8,004,624	1,008,577	12.60
Males.....	8,333,692	7,409,970	923,722	12.47
Females.....	679,509	594,654	84,855	14.27
Professional service.....	944,323	603,202	341,121	56.55
Males.....	632,641	425,947	206,694	48.53
Females.....	311,682	177,255	134,427	75.84
Domestic and personal service....	4,360,506	3,503,443	857,063	24.46
Males.....	2,692,820	2,321,937	370,883	15.97
Females.....	1,667,686	1,181,506	486,180	41.15
Trade and transportation.....	3,325,962	1,866,481	1,459,481	78.19
Males.....	3,097,653	1,803,620	1,294,024	71.75
Females.....	228,309	62,852	165,457	263.25
Manufacturing and mechanical industries.....	5,091,669	3,414,349	1,677,320	49.13
Males.....	4,064,144	2,783,459	1,280,685	46.01
Females.....	1,027,525	630,890	396,635	62.87

"As shown by the above table, there has been an increase since 1880 of 5,343,562 persons engaged in gainful occupations, or 30.72 per cent. There has been an increase of 4,076,008 males engaged in gainful occupations, or 27.64 per cent., and of 1,267,554 females, or 47.88 per cent. Persons engaged in agriculture, fisheries, and mining have increased since 1880 to the number of 1,008,577, or 12.60 per cent., the percentage of increase for females exceeding slightly that of males. Persons engaged in professional service have increased 56.55 per cent. since 1880, and those in domestic and personal service 24.46 per cent.; in both of these classes the percentage of increase for females is largely

in excess of that for males. Persons engaged in trade and transportation have increased 78.19 per cent. since 1880, the percentage of increase for females being especially large, or 263.25 per cent., principally due to the large increase in the number of females employed as bookkeepers, clerks, stenographers, typewriters, and saleswomen. Persons engaged in manufacturing and mechanical industries have increased 49.13 per cent. since 1880, the percentage of increase for males being 46.01 per cent. and the percentage of increase for females 62.87 per cent.¹¹

Concerning occupations in Great Britain, Fabian Tract, No. 5 (Revised edition, 1875), gives the following summaries compiled from Reports of the 1891 census for England and Wales, C—7058; Scotland, C—7134; and Ireland, C—6780.

	Males.	Females.	Total.
Industrial.....	6,641,637	2,383,521	9,025,158
Agricultural.....	2,349,652	173,176	2,522,828
Commercial.....	1,616,065	47,795	1,663,860
Domestic.....	188,365	2,170,260	2,358,625
Professional.....	812,242	439,452	1,251,694
	11,607,961	5,214,204	16,822,165
Unoccupied, under 20..	6,163,219	6,795,984	12,959,203
Unoccupied, over 20....	543,038	*7,407,509	7,950,547
	18,314,218	19,417,697	37,731,915

* Most of these are married women engaged in domestic work, although not so described.

The detailed occupations, according to the census of 1891, was as follows:

Agriculture.....	1,311,720
Fishing.....	25,225
Mining.....	561,637

OCEANA. See HARRINGTON.

OCTROI (from French *octroyer*, to grant) is used sometimes in economic science for a commercial concession or grant conceded by a government to an individual person or a company; it is used, however, more commonly for the tax or duty levied at the gates of cities, particularly in France and Italy and some other European countries, on articles brought into the city. (For a discussion of the principles involved, see **TAXATION**; **MIDDLE AGES**; **PROTECTION**; **FREE TRADE**.)

OLD AGE PENSIONS.—Old age has been shown by recent investigations to be, if not the chief, at least among the two or three chief causes of pauperism. It is therefore very seriously proposed to-day to pension all aged persons, and the proposal of various ways in which this may be done has led, in England at least, to no little discussion and literature on the subject. In continental Europe several countries have even already entered upon large and important experiments in this direction, so that there already exists considerable information upon the subject.

While in England the credit for the first serious agitation of the subject belongs to Canon Blackley, it is to the investigations of Charles Booth that we owe the information on which the need for pensions is based and perhaps the most careful plea for the establishment of such pensions. Mr. Booth, in his investigations in East London, came to the conclusion that old age was the chief cause of confirmed pauperism, and subsequent and more extended investigations have made him declare, in his most recent books, that the paupers in England and Wales under 60 are only 4.6 per cent. of the population under 60, while those over 65 are 26 per cent. of the population over 65, so that the increase from 4.6 to 26 per cent. is the measure of the direct or indirect effect of old age upon pauperism. (See Mr. Acland's Introduction to J. A. Spender's *The State and Pensions in Old Age*, p. xviii.) In Mr. Booth's latest book he states that the number of the aged who receive public aid in the different parishes rarely falls under one-third and rises often to one-half. Such figures, to be looked at again more carefully, will show the gravity of the problem, and we now look at the experiments and proposals that have been made toward its solution. In this the prime place belongs undoubtedly to Germany. Here, and here alone, is a compulsory system of State insurance actually at work.

Germany has long held to the policy of the control of industry and life by the State (see **GERMANY AND SOCIAL REFORM**; also **BISMARCK**). As early as 1854 the Prussian legislature made membership for workmen in sick relief societies compulsory. In June, 1883, was enacted the celebrated present German Sick Insurance Law. In 1884 was passed the Accident Insurance Law; June 22, 1886, the Invalidity and Old Age Insurance Law. "This," says a statement prepared by the Imperial Insurance Department in Berlin, for the World's Fair at Chicago (1893), "is intended to secure to persons employed for wages or salary a legal provision in cases not covered by the Sickness and Accident Insurance Laws. The Invalidity and Old Age Insurance Law of June 22, 1886, subjects to compulsory insurance (from the completed sixteenth year of age) (1) all persons working for wages in every branch of trade, apprentices and servants included; (2) managing officials and commercial assistants (clerks and apprentices) with regular year's earnings up to two thousand marks. The obligation to insure may also be extended (by order of the Federal Council) (3) to small masters (with only one assistant workman), and (4) to so-called home-industrials (irrespective of the number of hands employed); otherwise these small employers are allowed to join voluntarily the insurance. Such persons, however, as have either given up or for a time laid aside an occupation involving compulsory insurance, possess the right to continue or renew the insurance by paying voluntary contributions.

"The pension for old age will be granted, without proof of disability, to all who have completed their

seventieth year. It forms an addition to the earnings of old but not incapacitated working people, and makes some amends for the diminished vigor of age. The waiting time here comprises thirty contributory years, so that for 30 x 47, or for 1410 weeks, contributions must have been paid before the insured can enter upon the enjoyment of the pension.

"Attested periods of illness and military service, as well as other interruptions in regular employment (up to four months), will be reckoned in the waiting time for both annuities.

"The money to pay the invalidity and old age pensions is furnished jointly by the empire, the employers, and the employed. The empire contributes to each annuity the fixed amount of fifty marks per annum and pays the contributions of the workmen while serving in the army or navy. It defrays the expenses also of the imperial insurance department, and effects gratuitously, as in the case of the accident insurance, the payment of pensions through the post-offices. All other expenses are borne in equal shares by the insured and their employers, and are raised by current contributions. As a rule, the payment of the contributions is to be made by the employer, who, after purchasing stamps (resembling postage stamps) of the respective local insurance office, affixes them (to the amount of the contribution due) to the receipt card of the insured. These stamps may be had at all the post-offices and at numerous private shops. The contributions are to be paid for each calendar week in which the insured finds himself in an employment or service subject to the insurance ('contributory week,' 'weekly contribution').

"The carrying out of the invalidity and old age insurance is intrusted, under State guaranty, to special insurance institutions, whose districts coincide with the communal or State divisions. Every insurance institution possesses the character of a legal person, and is managed on the basis of a statute drawn up by the managing 'committee.' This committee is composed of at least five representatives of both employers and insured (chosen by the directing boards of the sick-relief clubs and similarly constituted bodies).

"As regards the results of the invalidity and old age insurance, in the first year (1891) no less than 132,917 annuities have been granted, 15,306,754.34 marks (including 6,049,848.41 marks State subsidies) have been paid out, and 95,000,000 marks have been received from the sale of receipt-card stamps."

This system is not intended as a substitute for the Poor Law. It has been loudly complained of in Germany as inadequate. "The pension," says Dr. Geffcken (*Nineteenth Century*, September, 1891), "cannot be regarded as a competence. . . . The majority of the Berlin poor receive 144 to 180 marks a year, some even 360." An average pension would give 150 marks. The pension is proportioned to the contributions, which bear a fixed proportion to wages. Hence, those who are most needy, being able to have saved the least, get the least. Nor does the law relieve those who, through unemployment, have not been able to pay their contributions, payments being made through the employer. It is hard again to define who is a working man. The law does not reach married women. It is very complicated in action. All these are serious drawbacks. The law is reported by some to be unpopular among the German workmen. Others declare that it works well and that the trouble is with a few details, not the principle.

France has done less, but proposed more than Germany. The *Caisse de Retraites*, or National Pension

France.

Bureau, was one of the many projects proposed after the Revolution of 1848, and which has continued in one form or another to the present. The law of 1850 provided that the capital should consist of deposits, which were to be of not less than five francs, and 5 per cent. interest was guaranteed. This was taken advantage of by others than workmen, and the amount was limited that could be deposited annually, and the interest decreased. One hundred and fifty dollars, then \$200, then \$300, were the limits of annuities, and the *caisse* gradually became an institution of the middle class, not the poor. In 1871 the interest was again raised to 5 per cent., and by 1882 there was a deficit of \$8,400,000. The State settled this and lessened the interest, and the amount of deposits decreased one-half. To-day less than one-tenth of the depositors are of the working class, and the average amount of the pensions is scarcely \$1.70 a month. In 1891 M. Constans, Minister of the Interior, proposed a bill whereby every working man, who

does not before a magistrate declare his unwillingness to do so, shall pay either 1 or 2 cents a day for seventy-five days in the year from his twenty-fifth to his fifty-fifth year. This the employer must double. This, if continued thirty years with compound interest at 4 per cent., means \$32 or \$120, according as the man pays 1 or 2 cents. To this amount the State, besides conducting the insurance and guaranteeing the interest, is to add two-thirds, making the annuities \$60 and \$120. The pension is limited to French men and women earning, at the age of twenty-five, less than \$600 per year, and if, at the age of fifty-six, the recipients have an amount exceeding \$120 they lose the State portion of the annuity. To prevent employers avoiding the law by employing foreigners, a tax is laid on all foreign workmen employed. The workman, if he choose, can pay more and receive a death insurance. The charges to the State the first year are estimated at \$750,000, but at the end of thirty years it is hoped they will be only nominal. The bill has been severely criticized and will probably be radically changed, but made the basis of some action. It is claimed that by depriving those who have saved a little of the State portion of the annuity it discourages thrift; and by allowing the workman to contract himself out of the plan and compelling the employer to pay if the workman does not, it is feared that employers will instruct their men to contract themselves out.

Denmark, in 1891, laid a new tax on lager beer, but the radicals got a vote applying a portion of the revenue to a system of old age pensions, without previous payments. All persons over 60, who can prove that for 10 years previous they have neither received relief under the poor law, nor have been convicted of mendacity, can apply to the communal (town) councils, and unless proven to have been disorderly or extravagant—in which case appeal can be made to the county council—they must receive relief; the amount to be suited to the case. The State pays one-half the cost, not to exceed \$550,000. It is thus, in effect, an honorary poor-rate.

Denmark.

Italy has long aimed at establishing an old age pension. It was a favorite plan with Cavour. Nothing, however, has yet been done. According to the report of the (English) Royal Labor Commission on Italy (p. 91):

"A bill (*Proposta di Legge*), based upon abortive schemes of Signor Berti and Signor Grimaldi, was laid before the Chamber of Deputies by Signor Vaccelli and Signor Ferraris in December, 1887, and after it had been brought in a second time two years later (December, 1889), a committee was appointed to consider it, and a report upon it was presented to the Chamber in July, 1890.

Italy.

This bill, which does not appear to have become law, proposes to establish a special fund in connection with the banks of issue and deposit, the interest on which shall be devoted to providing pensions for laborers, men of 60 years old and upward, in the form of bonuses or yearly contributions. The payments of working men, subscribers to the fund, were to be made annually and not to exceed 500 lire. The fund from which the pensions are paid is derived partly from the subscriptions of members, and partly from certain consignments of shares in the savings-banks and other public sources."

Coming to England, we have a variety of propositions, for information of which we are indebted to Mr. J. A. Spender's *The State and Pensions in Old Age*. As long ago as 1772 a bill for such annuities was passed by the House of Commons, but rejected by the Lords. Thomas Paine, in the second volume of his *Rights of Man*, propounded another scheme, but nothing was done. Since 1865, the Post-office has granted some opportunities for purchasing annuities, but only 19,379 immediate and 1723 deferred annuities have been bought. The plan, however, has not worked, Mr. Spender thinks, because the Government has not really pushed the scheme. A somewhat involved passive scheme will not succeed against the efforts of pushing private companies. Within ten years, however, great interest has been taken in old age

pensions in England. Canon Blackley first zealously promoted a scheme of his own devising. All persons of all classes were to be compelled to pay a national friendly or provident society between the ages of 18 and 21 about £10, which was to guarantee the wage-earning class 8s. a week sick pay, and 4s. a week old age benefit after the age of 70. The National Provident League took up the idea,

England.

and in 1885 a select committee of the House of Lords was appointed to report on the idea. It reported, in 1887, adversely, or at least recommending waiting "the further development of public opinion." The committee did not believe that the working men wanted compulsory insurance. They objected to all classes being taxed to benefit one class. They did not believe that it would encourage thrift. They thought the scheme, on the testimony of experts, financially unsound. The claim that it would injure the friendly societies, however, they did not accept. They thought the sick benefit of the scheme more open to criticism than the old age benefits. In 1890 Mr. Thomas Burt, M. P., moved for a return showing the number of persons over 60 receiving relief, on a given day in the year. This appeared in December, 1890, and showed that on August 1, 41,180 persons between 60 and 65, and 24,567 over 65, were receiving relief. From this Mr. Charles Booth has figured that 331,596 separate persons over 65 had recourse to the poor law that year. Meantime discussion has gone on. Canon Blackley has proposed to meet the difficulty of getting the unemployed to pay, by letting them work instead of pay. The National Provident League has put forth a plan for voluntary State-aided old age pensions on the principles (1) that the receivers themselves contribute; (2) that the State aid be granted only through some "financially sound organization" like a friendly society or annuity office. Each individual insured is to receive £14 a year payable at 65, one-half to be paid out of his own payments, one-half by State aid. Each recipient is also to be entitled to any poor-law out-door relief besides, which may be necessary, and if he dies before receiving his pension, his nominee is to receive a sum not above £5. Among the objections to this plan it has been claimed that the Government would have to supervise all societies, to see if they were financially sound, and would never know how much additional poor-law relief might be "necessary."

Many other plans have been proposed. Mr. W. Vallance has a plan similar to M. Constans in France. Mr. Chamberlain (*National Review*, February, 1892), has published a plan embodying the conclusions of a voluntary committee of the House of Commons in 1891. According to this plan, the State is to guarantee a pension of 5s. a week, at 65, and certain payments to widows and children in case of death. Each insurer is to pay £5 before the age of 25. Women are to be insured on a lower scale. It is objected to this plan that some orders of Odd Fellows already offer better terms. Finally, it is proposed, and this is the plan which Mr. Booth indorses, that a minimum pension of say, 5s. a week, be paid to every person, without distinction of class or wealth, who has attained the age of 65. It is claimed that this will not pauperize, since all may receive it; it involves for it many administrative difficulties. It is calculated that it would cost £14,000,000 a year.

Mr. Booth (*Pauperism and the Endowment of Old Age*, pt. ii. chap. vi.) considers the following objections to the plan:

Objections.

First. That it would tax the rich, and chiefly for the benefit of the idle and worthless. He admits that it would tax the rich more than it brought in to them, but they are taxed now for the poor. It need not of necessity tax the thrifty more than they receive.

Second. It is said that those who never reach 65 would not benefit at all. But this is true of all deferred annuities, and is really no injustice.

Third. It is urged that the sum of 5s. a week is inadequate, and therefore cruel, and calculated to stimulate begging. Mr. Booth says it is not intended to be adequate, but to encourage saving, and not reliance upon the pensions. Some pensioners might beg, but since some thrift or family help could, with the pension, make begging unnecessary, it would tend to decrease begging.

Fourth. It is said that such a pension would be pauperism under a new form, only that this would pauperize the whole nation; while, *fifth*, it is absurd to give to those who do not need it, and, *sixth*, it is unjust that the undeserving should benefit equally with the deserving. To these three objections Mr. Booth assumes that exactly because the benefit is given to all, rich and poor alike, it does not pauperize. Only this is it possible to make the benefit really dignified. By giving to the poor alone you would pauperize; by examining into the worth of the character, you open up dangers more subtle still.

Seventh. It is asserted that the assumption by the

State of responsibility for the maintenance of the old would be dangerous. But the State at present promises to do more for those who need it, by keeping them in the poorhouse.

Eighth. It is said that it would hurt the work of thrift agencies. Mr. Booth thinks that it would aid them and push them forward in true lines.

Ninth. It is urged that the principles of independence and thrift would be assailed by a provision which takes away the stimulus to saving, given by the prospect of destitution in old age. Mr. Booth believes there is no danger on this point. Those who are not driven to work and save for immediate needs, would not work if they did have to provide wholly for old age. Five shillings a week, after 65, will not prevent any saving that would otherwise be made.

Tenth. It is said that it is the duty of children to support their parents. This argument, if good at all, is good against all saving for old age.

Eleventh. Some say it would prevent emigration, but so would any improvement in England.

Twelfth. It is urged that the financial resources of the country would be overstrained. Mr. Booth figures the total cost (for England) to be £17,000,000. He would have the local authorities pay half the existing rates, which would be £4,000,000. It would leave £13,000,000 for taxation, with £3,000,000 for Scotland and Ireland. One halfpenny a pound on sugar would raise £6,000,000; *ad. on* tea, £2,000,000; drink could supply £2,000,000; *ad. on* the income tax, £6,000,000. Private charity now has to meet much of this expenditure. So it means no great increase of expenditure, simply a transfer to the public account. Cost could be charged to recipients. Lastly, it is claimed that the administration of these pensions would be difficult. Mr. Booth believes it could be done comparatively easily.

The arguments for the plan Mr. Booth believes to be the extent of pauperism, the great evil and present expense of it to the community. If the old and the sick were aided, the rest, he thinks, might be made independent. It would tend to make life more secure, and lift it up to a higher level.

Argument for.

Such is Mr. Booth's argument in brief, and such are the objections raised. Other suggestions, like reaching the desired end by providing better houses, will be discussed under tenement reform.

In the United States, the old age problem is not yet so serious. Professor Warner (in his *American Charities*, p. 55) points out that with us the leading cause of incipient pauperism is not so much the weakness of old age as the weakness of childhood. And yet old age pensions are proposed in the United States. Mr. Alfred Dolge at his works at Dolgeville (*q. v.*) and some other firms have private old age benefits. Many insurance companies (*q. v.*) provide for this. Government old age benefits have been advocated.

OMAHA PLATFORM.—The National People's Party platform, adopted at Omaha, Neb., July 4, 1892, is as follows:

Assembled upon the 116th anniversary of the Declaration of Independence, the People's Party of America, in their first national convention, invoking upon their action the blessing of Almighty God, put forth in the same, and on behalf of the people of this country, the following preamble and declaration of principles:

PREAMBLE.

The conditions which surround us best justify our cooperation; we meet in the midst of a nation brought to the verge of moral, political, and material ruin. Corruption dominates the ballot-box, the legislatures, the Congress, and touches even the ermine of the bench. The people are demoralized; most of the States have been compelled to isolate the voters at the polling places to prevent universal intimidation and bribery. The newspapers are largely subsidized or muzzled, public opinion silenced, business prostrated, homes covered with mortgages, labor impoverished, and the land concentrating in the hands of capitalists. The urban workmen are denied the right to organize for self-protection, imported pauperized labor beats down their wages, a hireling standing army, unrecognized by our laws, is established to shoot them down, and they are rapidly degenerating into Euro-

pean conditions. The fruits of the toil of millions are boldly stolen to build up colossal fortunes for a few, unprecedented in the history of mankind; and the possessors of those, in turn, despise the Republic and endanger liberty. From the same prolific womb of governmental injustice we breed the two great classes—tramps and millionaires.

The national power to create money is appropriated to enrich bondholders; a vast public debt payable in legal tender currency has been funded into gold-bearing bonds, thereby adding millions to the burdens of the people.

Silver, which has been accepted as coin since the dawn of history, has been demonetized to add to the purchasing power of gold by decreasing the value of all forms of property as well as human labor, and the supply of currency is purposely abridged to fatten usurers, bankrupt enterprise, and enslave industry. A vast conspiracy against mankind has been organized on two continents, and it is rapidly taking possession of the world. If not met and overthrown at once it forebodes terrible social convulsions, the destruction of civilization, or the establishment of an absolute despotism.

We have witnessed for more than a quarter of a century the struggles of the two great political parties for power and plunder, while grievous wrongs have been inflicted upon the suffering people. We charge that the controlling influences dominating both these parties have permitted the existing dreadful conditions to develop without serious effort to prevent or restrain them. Neither do they now promise us any substantial reform. They have agreed together to ignore, in the coming campaign, every issue but one. They propose to drown the outcries of a plundered people with the uproar of a sham battle over the tariff, so that capitalists, corporations, national banks, rings, trusts, watered stock, the demonetization of silver, and the oppressions of the usurers may all be lost sight of. They propose to sacrifice our homes, lives, and children on the altar of Mammon; to destroy the multitude in order to secure corruption funds from the millionaires.

Assembled on the anniversary of the birthday of the nation, and filled with the spirit of the grand general and chief who established our independence, we seek to restore the government of the Republic to the hands of "the plain people," with which class it originated. We assert our purposes to be identical with the purposes of the National Constitution; to form a more perfect union and establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty for ourselves and our posterity.

We declare that this Republic can only endure as a free government while built upon the love of the whole people for each other and for the nation; that it cannot be pinned together by bayonets; that the civil war is over, and that every passion and resentment which grew out of it must die with it, and that we must be in fact, as we are in name, one united brotherhood of free men.

Our country finds itself confronted by conditions for which there is no precedent in the history of the world; our annual agricultural productions amount to billions of dollars in value, which must, within a few weeks or months, be exchanged for billions of dollars' worth of commodities consumed in their production; the existing currency supply is wholly inadequate to make this exchange; the results are falling prices, the formation of combines and rings, the impoverishment of the producing class. We pledge ourselves that if given power we will labor to correct these evils by wise and reasonable legislation, in accordance with the terms of our platform.

We believe that the power of government—in other words, of the people—should be expanded (as in the case of the postal service) as rapidly and as far as the good sense of an intelligent people and the teachings of experience shall justify, to the end that oppression, injustice, and poverty shall eventually cease in the land.

While our sympathies as a party of reform are naturally upon the side of every proposition which will tend to make men intelligent, virtuous, and temperate, we nevertheless regard these questions, important as they are, as secondary to the great issues now pressing for solution, and upon which not only our individual prosperity but the very existence of free institutions depend; and we ask all men to first help us to determine whether we are to have a republic to administer before we differ as to the conditions upon which it is to be administered; believing that the forces

of reform this day organized will never cease to move forward until every wrong is remedied and equal rights and equal privileges securely established for all the men and women of this country.

PLATFORM.

We declare, therefore:

First.—That the union of the labor forces of the United States this day consummated shall be permanent and perpetual. May its spirit enter into all hearts for the salvation of the republic and the uplifting of mankind!

Second.—Wealth belongs to him who creates it, and every dollar taken from industry without an equivalent is robbery. "If any will not work, neither shall he eat." The interests of rural and civic labor are the same; their enemies are identical.

Third.—We believe that the time has come when the railroad corporations will either own the people or the people must own the railroads; and should the Government enter upon the work of owning and managing all railroads, we should favor an amendment to the Constitution by which all persons engaged in the Government service shall be placed under a civil-service regulation of the most rigid character, so as to prevent the increase of the power of the national administration by the use of such additional Government employees.

FINANCE.—We demand a national currency, safe, sound, and flexible, issued by the general Government only, a full legal tender for all debts, public and private, and that without the use of banking corporations, a just, equitable, and efficient means of distribution direct to the people, at a tax not to exceed 2 per cent. per annum, to be provided as set forth in the sub-treasury plan of the Farmers' Alliance, or a better system; also by payments in discharge of its obligations for public improvements.

1. We demand free and unlimited coinage of silver and gold at the present legal ratio of 16 to 1.

2. We demand that the amount of circulating medium be speedily increased to not less than \$50 per capita.

3. We demand a graduated income tax.

4. We believe that the money of the country should be kept as much as possible in the hands of the people, and hence we demand that all State and national revenues shall be limited to the necessary expenses of the Government, economically and honestly administered.

5. We demand that postal savings banks be established by the Government for the safe deposit of the earnings of the people and to facilitate exchange.

TRANSPORTATION.—Transportation being a means of exchange and a public necessity, the Government should own and operate the railroads in the interest of the people. The telegraph and telephone, like the post-office system, being a necessity for the transmission of news, should be owned and operated by the Government in the interest of the people.

LAND.—The land, including all the natural sources of wealth, is the heritage of the people, and should not be monopolized for speculative purposes, and alien ownership of land should be prohibited. All land now held by railroads and other corporations in excess of their actual needs, and all lands now owned by aliens, should be reclaimed by the Government and held for actual settlers only.

EXPRESSION OF SENTIMENT.

Your committee on platform and resolutions beg leave unanimously to report the following:

WHEREAS, Other questions have been presented for our consideration, we hereby submit the following, not as a part of the platform of the People's Party, but as resolutions expressive of the sentiment of this convention:

1. *Resolved,* That we demand a free ballot and a fair count in all elections, and pledge ourselves to secure it to every legal voter without federal intervention, through the adoption by the States of the unperverted Australian or secret ballot system.

2. *Resolved,* That the revenue derived from a graduated income tax should be applied to the reduction of the burden of taxation now levied upon the domestic industries of this country.

3. *Resolved,* That we pledge our support to fair and liberal pensions to ex-Union soldiers and sailors.

4. *Resolved,* That we condemn the fallacy of protecting American labor under the present system, which opens our ports to the pauper and criminal classes of the world and crowds out our wage-earners; and we denounce the present ineffective laws against contract labor, and demand the further restriction of undesirable immigration.

5. *Resolved*, That we cordially sympathize with the efforts of organized working men to shorten the hours of labor, and demand a rigid enforcement of the existing eight-hour law on Government work, and ask that a penalty clause be added to the said law.

6. *Resolved*, That we regard the maintenance of a large standing army of mercenaries, known as the Pinkerton system, as a menace to our liberties, and we demand its abolition; and we condemn the recent invasion of the territory of Wyoming by the hired assassins of plutocracy, assisted by federal officers.

ONEIDA COMMUNITY.—A community of communists and perfectionists started at Oneida in 1847, by John H. Noyes. For the motives and circumstances which led to its establishment, see article NOYES. Noyes himself says that the community issued from a conjunction between the revivalism of orthodoxy (perfectionism), and the socialism of Unitarianism. (See BROOK FARM.) At any rate Noyes' "new family" of perfectionists, containing about 50 members, purchased about 600 acres at Oneida Creek, N. Y., and proceeded to bring it into cultivation. Financially they were very successful. The amount of property brought in up to January 1, 1857, was \$107,706.45. The amount held in Oneida at that date was \$41,740, and branch communities at Putney, Wallingsford, and elsewhere had \$25,532.22 more, so that the total assets were then \$40,434.23 less than the amount brought in—a discouraging first ten years. But from that time the community financially succeeded. In 1857 the net earnings were \$5,470.11, and for the next ten years they averaged \$18,058.02 a year above all expenses. In 1868 they were \$55,100.83. The community had wisely left its policy of pushing branches, and concentrated all its strength on Oneida and Wallingsford. This financial success has been due to good management, but in no small degree to the inventive faculty of one of "the family," Sewell Newhouse, an old Canadian trapper, who invented a trap—the Oneida trap—almost universally used by trappers. By 1874 there were at Oneida 238 persons, and at Wallingsford, 45. They had no formally chosen chief, believing that thus the fittest will lead, and as the result Mr. Noyes was the actual leader, and usually wise and popular. All worked hard for the good of the community. The men wore no especial garb, but the women wore the hair cut short, did not lace, but wore a tunic falling to the knees and trousers of the same material, a vest buttoned high and a straw hat. In this costume, according to Mr. Hepworth Dixon, "plain women escaped notice and pretty girls looked winsome." They drank no beer, and only a weak, home-made wine. They practised what their critics call free love, but this they deny in the sense usually attached to free love. All the males and females of the "family" were united by a "complex marriage," but their intercourse, while unfettered by law, was in practise subject to a great deal of regulation. Says Mr. Noyes:

"Marriage is permanent union; licentiousness deals in temporary flirtations. In marriage, communism of property goes with communism of persons. In licentiousness love is paid for as hired labor. Marriage makes a man responsible for the consequences of his acts of love to a woman. In licentiousness a man imposes on a woman the heavy burdens of maternity, ruining both her reputation and her health,

and then goes his way without responsibility. Marriage provides for the maintenance and education of children. Licentiousness ignores children as nuisances, and leaves them to chance. *Now in respect to every one of these points of difference between marriage and licentiousness, we stand with marriage.* Freedom with us does not mean freedom to love to-day and leave to-morrow. . . . Our communities are *families* as distinctly bounded and separated from promiscuous society as ordinary households. The tie that binds us together is as permanent, and sacred, to say the least, as that of marriage, for it is our religion. We receive no members (except by deception or mistake) who do not give heart and hand to the family interest for life and forever. Community of property extends just as far as freedom of love. Every man's care and every man's dollar of the common property is pledged for the maintenance and protection of the women and the education of the children of the community. . . . Whoever will take the trouble to follow our track from the beginning will find no forsaken women or children by the way. In this respect we claim to be in advance of marriage and common civilization. . . . We are *not* "free lovers" in any sense that makes love less binding or responsible than it is in marriage." (Noyes, *History of American Socialisms*, pp. 639-640). The Oneida community believed that the human heart can love any number of times and any number of persons, and that the more it loves, the more it can love. It believes this to be the law of nature and of God. Its members believe that certain physiological rules should be considered as to who should marry. To the old they would give the young; to opposites, opposites should be given. No proposals of marriage are allowed except through third persons (in order that connections may be made with discretion and not merely through passion). In many ways therefore they were certainly free from a part of the evils of free love, and their way they considered vastly more free from sin, and the misfortune of marriage for life of unsuited mates, than ordinary marriage.

All too was religious; their practises resting on intricate spiritualistic philosophy that cannot be stated sufficiently briefly for this article. Two books have been published by Mr. Noyes, giving their religious ideas: *The Berean*, published in Putney (1847), and *Bible Communism*, published at Oneida (1848). Both are now out of print. A short account of their religious tenets will be found in Noyes' *History of American Socialisms*. The Oneida communists were perfectionists and spiritualists, (tho not in the sense of spirit-rapping spiritualists). One of their most remarkable institutions was "mutual criticism," the formal public criticism of one another; which was so successful that they considered it vital to their success.

Public opinion was strongly against them. Finally, in 1879, a conference of clergymen of various churches, from the principal cities of New York State, met at Syracuse and laid plans to eradicate the evil. Before action was taken, however, Mr. Noyes proposed to the managers of the community to abandon the free-love practise of their community, in deference to public sentiment, tho still insisting that it was not immoral. This offer was accepted, and in 1881 the society became an ordinary joint-stock concern. Mr. Noyes himself had to retire to Canada, where he died April 13, 1886. The community, in 1879, had property valued at over \$600,000, and still keeps up its credit as a joint-stock concern, living peacefully, quietly, and with the good will of its immediate neighborhood, as indeed did the community in its communistic days.

OVERCROWDING. See CITY.

OVERPRODUCTION is defined by the majority report of the English Commission on the Depression of Trade and Industry, as "the production of commodities, or even the existence of a capacity for production, at a time when the demand is not sufficiently brisk to maintain a remunerative price to the producer." The report affirms that "such an overproduction has been one of the prominent features of the course of trade during recent years, and that the depression under which we are now suffering may be partially explained by this fact." The minority report lays still more emphasis upon "systematic overproduction," and says that "the demand for commodities does not increase at the same rate as formerly, and that our capacity for production is consequently in excess of our home and export demand, and could, moreover, be considerably increased, at short notice, by the fuller employment of labor and appliances now partially idle." Similarly says Mr. Carroll D. Wright in his *Report on Industrial Depressions* (Washington, 1886, p. 89): "So far as the factories and the operatives of the countries concerned are to be taken into consideration (England, the United States, France, Belgium, Germany), there does exist a positive and emphatic overproduction, and the overproduction could not exist without the introduction of power machinery at a rate greater than the consuming power of the nations involved and of those dependent upon them demands; in other words, the overproduction of power machinery logically results in the overproduction of goods made with the aid of such machinery, and this represents the condition of those countries dependent largely upon mechanical industries for their prosperity." Mr. Edward Atkinson, in numerous essays, and Mr. David A. Wells, in his *Recent Economic Changes*, argue the same way.

In Europe Lord Playfair, writing in 1888, adduces for this position the authority of Dr. A. von Studnitz, Piermez, Jules Duckert, Laveleye, Trassenster, Annecke and Engel. Mr. Wells finds the asserted excess of production due to three prime causes: First, increased capacity of production; second, improved methods of distribution; third, the opening up of new abundant supplies of raw material. (For details on these points see articles MACHINERY AND COMMERCE.) Mr. Hobson (*The Evolution of Modern Capitalism*, p. 173) shows that the rise of productiveness in machinery in England, between 1850 and 1885, may be roughly estimated at 40 per cent., while Mr. Wright, in the above mentioned report, shows that in the United States, between 1866 and 1886, the gain of machinery—taking the aggregate, as measured by "the displacement of muscular labor," was more than one-third, while in some trades, the improvement of mechanical productiveness for labor was from 50 to 300 per cent. Commerce has made even greater gains. A ton of wheat can now be hauled by sea at less than a farthing per mile. The opening of the Suez canal is said to have destroyed a tonnage of two millions. Raw material can be delivered in bulk in England at only a trifle more than the cost

of its production in its far-away home. All this has enormously increased the capabilities of production. The amount of overproduction must, as Mr. Hobson has pointed out in his *Evolution of Modern Capitalism*, by no means be measured by the amount of goods actually produced for which there are no buyers; this is but a small portion of the evil. A far greater evil is that the factories are often able to produce in a short while far more than there is any hope of selling, and so they stop work. This produces not only a glut upon the market, but shuts down factories, workshops, mines, railway enterprises, etc.

The circle of our production is thus stated by Hobson (*idem*, p. 179): "Improved machinery of manufacture and transport enables larger and larger quantities of raw material to pass more quickly and more cheaply through the several processes of production. Consumers do not, in fact, increase their consumption as quickly and to an equal extent. Hence the outward flow of productive goods is checked in one or more of the manufacturing stages, or in the hands of the merchant, or even in the retail shops. This congestion of the channels of production automatically checks production, depriving of all use a large quantity of the machinery and a large quantity of labor. The general fall of money income which has necessarily followed from a fall of prices, uncompensated by a corresponding expansion of sales, induces a shrinkage of consumption. Under depressed trade, while the markets continue to be glutted with unsold goods, only so much current production is maintained as will correspond to the shrunk consumption of the depressed community. Before the turn in the commercial tide, current production even falls below the level of current consumption of the glut of goods which had congested the machine. After the congestion which had kept prices low is removed, prices begin to rise, demand is more active at each point of industry, and we see the usual symptoms of reviving trade."

Thus analyzing the cycle, Mr. Hobson argues that the root evil is *under-consumption* rather than overproduction, a thought which we shall revert to later. Here we notice that English economists have largely denied the possibility of a *general* condition of overproduction. They have argued that every one who produces creates a corresponding power to consume. Producers may produce the wrong kinds of goods—goods for which there is no market—so that in certain trades or lines of goods there may be a trade overproduction, but the mere fact of production creates with it the ability to consume, so that the total production cannot be more than the total ability to consume. This argument Hobson quotes from Adam Smith, McCulloch, and J. B. Say, but it is a superficial view. Hobson says: "The fallacy involved in the supposition that oversupply is impossible, consists in assuming that the power to consume and the desire to consume necessarily coexist in the same persons." He instances the case of a glut of cotton goods, due to improved cotton machinery. The spinners and manufacturers have the desire to consume; that is, to exchange these goods for commodities; but the ill-clad of Russia, East London, and even Manchester, who desire the cotton goods, have no money nor anything else which the manufacturers want, and so the manufacturers cannot sell to them. But the manufacturers can sell, it is said, to those who perhaps do desire the labor of the ill-clad; so they sell the cotton goods to mer-

chants and buy what they want, while the ill-clad work for those who want their labor, and with their wages buy the cotton goods. Thus a roundabout exchange of goods arises, and Hobson says "this answer is valid on the assumption that the Lancashire producers desire to consume an equivalent of the goods they produce." But let us suppose, Hobson argues, that they do not desire to so consume. Suppose they desire not to consume so much, but to save or invest in more means of production, more mills, more means of transportation, etc. Then we have a production not balanced by an equal amount of consumption, and so there may be an overproduction. It is true that they may desire to produce more in order to consume more *eventually*, or to have their children consume more; still, *temporarily*, they do not consume as much as they produce, and so there is a cycle or season of overproduction which may occur in enough trades to be general. Hence Hobson argues that there may be too much saving; that all would be well if men would consume more—consume as much as they produce. Hence he maintains that the real trouble is not overproduction, but under-consumption; that a too sudden development of railroad-building, factory-building, etc., stimulates the market for a while, but leads to a temporary overproduction, which should have been avoided by more immediate consumption and less investment.

Socialists, however, find this analysis of Hobson's but partial. Why do not the ill-clad in Russia and London buy cotton goods? Because they have no money? Why do they not work and earn money? Some of them can find no work; others of them are too shiftless or too undisciplined to be willing to do work which is in demand. But why are they shiftless? Why have they so little energy? Very largely, socialists say, because of their environment, and still more largely because of their early environment. (See POVERTY, CAUSES OF). How can good environment be obtained? By self-effort, say some. But this is making the end develop the means. The question is, how to produce self-effort. You must have somewhat of good environment to produce self-effort. By wise charity, say others: model dwellings, penny savings banks, etc. But charity, even Associated Charity, (*q. v.*), admits by its leaders to-day that it cannot meet the whole problem. It takes the united action of society to reach the problem. Cities, municipalities, in spite of theorists, are more and more being driven to care for the helpless and the shiftless. But the cities cannot employ the unemployed, it is said, without such taxation as will crush the activities of those who are energetic and have self-help. Then let the municipalities themselves produce; themselves conduct natural monopolies; themselves become producers, in a word; and the municipality can consume (that is, spend) every dollar it produces, by employing men and women in productive work; that is, work that shall produce commodities, healthy homes, parks, art galleries, etc. These commodities, parks, art galleries, will not be themselves commercially productive, but be productive of

better life. Thus the shiftless and unemployed (for whatever reason they be unemployed) may be given opportunity or be compelled to work, and thus be able to consume more; a state which will in part, at least, equalize consumption with production. Therefore, even under the wage system, socialists maintain that more social production can aid distribution and so aid consumption; while, if universal cooperation ever replace the wage system, and the functions of the capitalist and the worker be not divided between two classes, but be united in the same class, then there will be little if any overproduction, and certainly no general overproduction, since when all men shall receive their share of what they produce, and one class shall not receive large profits and another scarcely a livelihood, all will have approximately equal ability to consume, and the wants of humanity can, as a whole, be not limited. It may even then be possible to produce more shoes than humanity can wear, but not for long. Hours can be limited and production so lessened; and at least there will not be the horrors that to-day accompany what is called overproduction, and which so excite the wrath of socialists—an "overproduction" of shoes, when millions are going shoeless; an overproduction of "corn," when thousands die of starvation; an "overproduction" of commodities which, sometimes, even "the very 'hands'" that have helped make them, bitterly long for, but cannot buy. Socialists are never weary of picturing the piano-makers, who have no piano in their homes; the carpet-weavers, who return to bare floors; the garment-workers, who live in all but nakedness. It is little wonder the term "overproduction" seems to them a mockery and a lie. Neither *overproduction*, nor *under-consumption*, is to them the root evil, but unequal distribution.

Wright's *Report on Industrial Depressions (First Annual Report of Commissioner of Labor, 1886)*; D. A. Wells' *Recent Economic Changes*, chap. iii.; J. S. Mill's *Political Economy*, book iii. chap. xiv.

OVERTIME is the time that employees work beyond the customary or legal hours. The practise of working overtime exists, particularly in England, in almost all trades to some degree, and in some trades is almost universal and carried to a large extent. When firms, as in the engineering, printing, or dress-making trades, have orders that must be filled speedily, they often seem all but compelled to work their employees overtime. And often employees are glad to do so—though whether wisely or not we shall in a moment consider—first, because they are glad to work more and so earn more, and, secondly, because most firms (though not all) pay at higher rates for overtime than for work in ordinary hours. The law, too, usually allows overtime in certain trades for certain reasons, provided that the employees are paid for it. We shall see that even this paid overtime is a questionable advantage and a questionable necessity; but in some trades over-

time is the rule and *not paid for*. In some trades, usually those paying the lowest wages, and usually employing girls, children, or the less intelligent men and women, employees are continually compelled to work overtime without extra payment, on threat of being discharged. Cases are by no means rare where girls and even men are locked in and compelled to work, sometimes late into the night with no extra pay. Usually the firm goes through the form of getting the employees to consent; the employees usually consent, knowing that if they do not they will be soon discharged. Sometimes the firms gain the employees' consent by offering a little lunch, or, occasionally, a drink. In the clothes-making trade of all descriptions, and in smaller shops of various trades, overtime is a very great evil. (See EIGHT-HOUR MOVEMENT; also SWEATING SYSTEM.) Even where firms pay employees for overtime and pay well, the better informed employees usually do not desire it; and sometimes do not desire it

Evils of Overtime.

when well paid for, is, *first*, because it very seriously prevents the reduction of the actual working hours and thus forfeits all the very great advantages of the short-hour movement. (See EIGHT-HOUR MOVEMENT.) Often, and particularly in England, overtime work renders practically nugatory the effect of short-hour legislation. *Second*, overtime, even when seemingly paid for, is not really paid for, and employees get no more pay than they would if they did not work overtime. This is for the reason that what determines the rate of pay is not the amount done or the hours worked, but the standard of living of the operatives in the given trade. Under competition no firm can long afford to give higher pay than the lowest for which operatives of the requisite ability are willing to work. What this is depends on what it costs the operatives to live. In the long run it is found that few operatives get more than what their standard of life demands (though this, of course, varies very much between skilled and unskilled trades, etc.). Therefore, if employees by working overtime earn more, the firm can, and often under competition must, lower the general rate of wages; and the employee finds himself working overtime and yet earning no more than before. (See WAGES; also PIECE WORK.)

Nor is overtime always so necessary or advantageous to employers as they imagine. Occasionally, in some trades, as those above mentioned, it does seem necessary; but usually even where it seems necessary, if it were absolutely forbidden, customers would learn to think ahead and give their orders in time to have them fulfilled in ordinary hours; the firms would do just as much work, with less friction, with less payment at high rates for overtime, and, above all, with less demoralizing effects on their employees. Sometimes employees who work overtime will slacken work in ordinary

times in order to get the higher rate of pay for overtime work. Mr. Rae (*Eight Hours for Work*, p. 122) says:

"Mr. Spill, an india-rubber manufacturer, informed the Children's Employment Commission that he found working overtime extremely unprofitable, because his men used to loiter over their work in the regular hours in order to get better pay for it by doing it during overtime."

Mr. Rae says again (*idem*, p. 98):

"The manager of a Massachusetts carpet-mill reports of the lengthening the ten-hours day by running overtime for a season, that the production increased for the first month after the overtime began, but then the men grew listless, the quantity of their output fell off, the quality of the goods deteriorated, and by the third month the books showed that the mill was doing no more in the day, with ten hours and overtime to boot, than it did before in the ten hours alone. The imposition of the strain takes time to tell to the full; the relaxation of the strain does the same."

From instances Mr. Rae concludes (*idem*, p. 65) that it is

"certainly very doubtful whether the world has ever gained anything by systematic overtime, and whether men would not do quite the same amount of work from year's end to year's end if it were abolished altogether. Mr. Bowling, one of the factory inspectors, remarks that he was struck with the frequency with which employers said to him overtime was utterly unprofitable, and nobody can read any of the reports of commissioners on labor or trade questions without being struck with the same circumstance. Incidental overtime may be unavoidable in the engineering trade, but the persistent overtime now habitually wrought might probably be abolished with positive benefit to production."

And yet in the engineering, printing, dressmaking, and other similar trades, overtime is the rule.

Mr. Redgrave, an English factory inspector, states that in 1872 all the nine-hour trades wrought systematic overtime, and mentions the case of an engineering firm that had recently adopted the nine-hours' system, but whose men, though nominally working 54 hours a week, were actually working 84 and being paid for 106.

Says an English writer in *Goodwill* for May, 1894:

"The overtime special exception of the Factory and Workshop Act provides that women and girls may be employed 14, instead of 12 hours, on 48 days in the year, in such trades as the making of wearing apparel, printing, the preparation of articles of food, etc., provided that certain conditions are fulfilled, and a notice of such employment posted to H. M. Inspector of Factories on each day that such overtime is worked. Girls working in dressmaking and millinery establishments form the largest section of the community influenced by this portion of the Act, and there are perhaps few trades—whether we regard the moral or physical well-being of the girls—in which a working day of 14 hours, from 8 A. M. to 10 P. M., seems less desirable.

"It is said that the immediate employers—we are especially considering dressmaking and millinery establishments—would lose custom, did they not oblige their customers by undertaking unexpected orders, executing, for instance, a large mourning order in a couple of days; but is there no other way out of the difficulty than to retain the girls and women, who have already worked twelve hours, for another two hours?"

"(It must be remembered that mourning orders admittedly take precedence of any other work in hand.) Customers reasonably object to such work being sent to outworkers; but would it be impossible for employers to keep a register of capable women, trained day-workers, who would be glad to come for a day's work when there is extra pressure. . . .

"So long ago as 1872 Miss Emily Faithful presented a numerous signed memorial praying for its repeal [the Special Exception Clause], and in 1875 the Royal

Not Necessary.

Commission appointed to inquire into the working of the Factory Act thus referred to the subject: "We trust in time that the use of overtime in trades of this class may be restricted down to the vanishing point, and we believe that not even in the most extreme case set before us is it absolutely necessary to the interests of society that those who minister to its wants should be overtasked to supply them."

"It is noteworthy that a large number of firms entitled to work overtime do not do so, and the dislike entertained for the system by some of the largest establishments was represented to the Commission. This might seem sufficient denial of the necessity of it for successful trade.

"Of the large number of firms entitled to work overtime in four typical counties (the metropolis not included), only 854 notices were sent in, during 12 months, by 71 firms; a considerable majority prospering equally well without it."

OUT OF WORK BENEFITS. See TRADE UNIONS; also UNEMPLOYMENT.

OWEN, ROBERT, sometimes called "the father of modern communism," was born at the village of Newtown, Montgomeryshire, in North Wales, in 1771. At ten years of age he was put to work in a draper's shop, but later he removed to Manchester where, when only nineteen years old, he was made manager of a large cotton mill. He became very successful in cotton manufacturing. In the year 1800 he purchased, with his partners, the New Lanark Mills on the Clyde, where Arkwright had in 1789 erected one of the earliest cotton-spinning establishments. His aim was to conduct the New Lanark Mills on higher principles than those common among manufacturers.

He tells us, in his autobiography, with what enormous difficulties he had to cope when he purchased the property in 1799. The position of the workers, as in all the factories of the period, was most pitiable. Women and children of the most tender age were employed under conditions which debased both mind and morals; drunkenness and ignorance, filth and immorality, were the characteristics of the population. Owen believed, however, in the omnipotent effect of circumstance in molding character; the notion that individuals form their own character he called "the enemy of humanity, the hydra of human calamity." He therefore set himself to work out reform on this principle.

Drunkenness was discontinued by the introduction of resorts where the workmen could find both pleasure and profit; immorality was checked by informal lectures setting forth its practical evils, as well as by various ingenious contrivances calculated to appeal to the honor of the operatives; the employment of young children was discontinued; the homes of the people were materially improved; good, honest provisions were supplied at cost price; children's schools were started, and insurance funds against old age and illness were not forgotten. His career at New Lanark was the most fruitful and beneficent epoch in an eventful life, and for many years he centered his attention on the necessary and the possible.

Owen's first book was *A New View of Society, or Essays on the Principle of the*

Formation of the Human Character, consisting of four essays, the first of which was published in 1813. This book contains Owen's creed, that man's character is made by circumstances, and that the one important thing to do, therefore, is to establish a right physical, moral, and social environment.

In 1815 Owen began an agitation for a factory law curtailing the hours of work, prohibiting infant labor, and affording health and education to operatives.

Notwithstanding the opposition of the employers and the doleful predictions of the orthodox economists, who foresaw the ruin of English industry by this unheard of violation of *laissez faire*, the bill finally became a law in 1819—the precursor of many reforms which have totally changed the condition of the English workman. "For this," says Professor Seligman, "if for nothing else, Owen is deserving of the highest praise and gratitude."

Owen's first public step in the path of socialism may be said to have been the famous report which, in 1817, he communicated to a committee of the House of Commons on the Poor Laws. In this report he pointed out that the only permanent remedy for distress was the united action of men and the subordination of machinery. For the treatment of pauperism he recommended communities.

He outlined the plan of a cooperative agricultural and manufacturing village. "This," says Professor Seligman, "was a most important step, the turning-point in his career and the virtual beginning of English socialism."

Every one was to work for the benefit of all; the meals were to be cooked and eaten in common; dormitories in the shape of parallelograms were to be erected, and the details of government regulated in the most minute manner. Owen became a fanatic in the prosecution of his new ideal; considering himself the most popular man in the kingdom, and influenced by the lavish attention heaped on him from all quarters. His plans were supported by many prominent men in England, including his special patron, the Duke of Kent, the father of Queen Victoria. But at this juncture his violent attack on all religions alienated the affections of many influential adherents—and it must be said that he showed a narrow-mindedness as great as that which he ascribed to his opponents. The change in his career was, however, the result not so much of his religious as of his socialistic views. Owen was now a world regenerator, an extremist, a socialistic idealist, whose confident anticipation of a millennium seemed to increase in inverse ratio to the failure of his practical schemes.

In 1825 he purchased New Harmony of the Rappites, who returned to Pennsylvania. New Harmony, at the time of its purchase, contained some 30,000 acres, 3000 of it under cultivation, with 19 detached farms and a regular village with streets, squares, churches, schools, and other edifices. (See NEW HARMONY.) Here Owen soon collected over 900 souls of "all classes and conditions of men," which he endeavored to constitute into a

community on the basis of exact equality, and in practise of community of labor and of goods.

To enter into the details of his communities would be impossible. The short-lived experiments of Motherwell and Orbiston in Scotland, and of New Harmony in Indiana, are well known. But Owen, nothing daunted, made a triumphal visit to America in 1829, being greeted with universal acclamation, as on the Continent ten years before. He had almost completed negotiations with the Mexican Government for the grant of an immense tract on which to attempt his experiment on a large scale—the President had signified his adherence to the scheme—when suddenly, with the fall of the liberal government, all the bright prospects again vanished.

After this inglorious attempt, Owen's interest in cooperation gradually vanished; his energy being henceforth centered on the propagation of his all-embracing socialistic schemes. On returning from America he made London the seat of his activity. Repeated addresses were issued, numerous associations formed, while the most bizarre ideas were proposed, such as the floating cooperative community on the Thames. In 1832 was established the "Labor Exchange System." In 1835 the word *socialism* first appears in Owen's propaganda. After an unsuccessful attempt to win over the trades-unions, at

whose first large congress he presided, Owen became still wilder. Bentham says that: "He begins in vapor and ends in smoke." In 1850 he called the world a great lunatic asylum, but was still full of confidence in his panacea; shortly after, he absolutely denied the right of property, and became an ardent spiritualist; and in his last year the old man showed the persistence of his convictions by addressing an open letter to the potentates of the earth, and by writing an autobiography full of youthful enthusiasm. He died at the age of 87 in his native town, November 19, 1858.

Owen was thus a visionary, like St. Simon and Fourier; but, more than they, he had a most beneficent effect on the social progress of his country. His economic doctrines were crude and often absurd; his theory of marriage was, to say the least, peculiar; his socialistic views were utopian; but he succeeded in proving that a factory could be made to benefit both master and workman; he initiated the reform in the condition of the laboring classes; he laid the firm foundation on which the cooperative movement of our times is erecting its successful edifice.

Besides what has been already mentioned, Owen wrote: *Book of the New Moral World* (1826-44), *Revolution in the Mind and Practise of the Human Race*, and *The Life of Robert Owen, written by Himself*, London, 1857. (See also ENGLAND AND SOCIAL REFORM.)

P

PACIFIC RAILWAY DEBTS.—In order to aid the building of the Pacific Railway, Congress (see CRÉDIT MOBILIER), loaned the Central Pacific Railway Company, originally, \$64,623,512. Bonds were issued at 6 per cent., maturing in 1895, '96, '97, '98, and '99. These 6 per cent. bonds are a full obligation of the United States, as between the holders and the Government; there is nothing, therefore, for the Treasury to do, but to pay them, or to extend them on acceptable terms. Since they are security for circulating bank-notes, the latter course can easily be followed, at not more than 3 nor less than 2 per cent., at the convenience of the Treasury. But as between the Government and the companies who first received them they constitute a debt nominally due and payable by the latter, or their successors, together with arrearages of interest also advanced, and only in part reimbursed by transportation services, or provided for by sinking-fund accumulations. The amount of this arrearage may now (1895) be approximated, and it is evident that, dealing with all the debtor companies together, it will fall not far short of the principal sums, or about \$125,000,000 in all, of which fully \$70,000,000 will be for the Central Pacific, and \$55,000,000 for the Union. The exact figures at any given date cannot be stated with precision on account of the mass of counter-credits for services delayed, disputed, or otherwise in suspense. Some authorities put it at \$138,000,000.

By the Act of 1862, construed literally, these advances were secured by a "first mortgage" (subsequently, in 1864, waived) upon the condition that "said company shall pay said bonds at maturity," and that on a failure or refusal to redeem said bonds or any part of them, when required to do so, the United States might take possession of the aided property for its own use and benefit. There are other complicated provisions for partial current payments for service and in one-twentieth of the "net earnings." It is evident that these cautionary clauses were properly introduced to secure something beyond and more important than the return of the face value of the bonds and interest at a given date, viz., the early completion of the road, or, that failing, the control of the corpus, and if need be, its transfer to other hands.

Unfortunately for the Government, Congress was in 1864 induced to make its claim a second mortgage on the roads instead of a first mortgage, and, still more unfortunately, the original contract was drawn in such a peculiar way that the Supreme Court has decided that only the main lines of the roads (and not their branches) are subject to the Government's lien. This means that the Government's claim of \$138,000,000 is secured by a second mortgage on only 2500 miles of road. In other words, the Government's second mortgage amounts to \$55,000 a mile, or twice as much as the total cost per mile of constructing President Hill's

new road (the Great Northern) from Minneapolis to Seattle. Plainly, therefore, the property is not normally worth more than half as much as the Government's mortgage upon it. The Government has, however, in the case of the Central Pacific, one further resource. This road is a California corporation, and its incorporators were by law liable for its debts up to the full amount of its stock. The Central Pacific owes the Government \$77,000,000, and the four estates of Messrs. Hopkins, Stanford, Crocker, and Huntington are liable for \$64,000,000—the amount of the stock held by them at the time of the incorporation.

Concerning the transactions of the Pacific company, the report of the Pacific Railway Commission of 1887 says, in brief:

"Congress enacted that the companies should have their stock fully paid in cash. The stock actually paid in amounted to \$1,797,000; the stock paid in 'as sworn to' amounted to \$97,098,000. The 2496 miles of aided roads were built at a cost of \$95,955,000. Stocks and bonds were issued on these to the amount of \$268,302,000, all of which was taken by the men who built and managed the roads. In the accounts of the Central Pacific Company the division of earnings for improper purposes amounted to many millions, through contracts made by Messrs. Stanford, Huntington, Hopkins, and Crocker with themselves. They constructed 1171 miles of road adjunct lines, at a cost of \$27,217,000. On account of that construction, in addition to a small cash payment, they issued bonds to themselves to the amount of \$33,722,000, and stock to the amount of \$49,005,000. Then as directors of the Central Pacific, they took leases of their own lines for the Central Pacific for \$3,400,000 per annum; which was at the rate of nearly 13 per cent. Fifteen months ago [in 1886] three of these directors [Stanford, Huntington, and Crocker] contracted with themselves to build an extension of 103 miles. In payment they issued stock to the amount of \$8,000,000, and bonds to the amount of \$4,500,000, the market value of the stock and bonds being at the time \$8,349,000. The actual cost of construction was \$3,505,000, so that they personally profited by their own votes by that single transaction to the extent of \$4,834,000, etc., etc. Had the Pacific railroads been built and managed upon honest methods, had the Government loan been properly applied, these companies, regarded as a whole, could have declared dividends at the rate of 6 per cent. per annum for eighteen years, from the date of actual completion to the present time, upon all the moneys that they would have been required to pay in to complete and equip the roads; they would have owned 2495 miles of roads free from all debt, and worth \$124,700,000, upon an original outlay of less than \$35,490,381.44; three of them, the Union Pacific, Central Pacific, and Central Branch, could have repaid every cent of the principal and interest advanced by the Government to date, and could have reduced their charges to shippers to the extent of over \$140,000,000, or nearly \$8,000,000 per year. But they chose dishonest methods. At the outset they divided \$172,347,113 of fictitious capital, they dissipated over \$107,000,000 which should have been applied to the payment of the principal and interest of the Government debt, and they taxed shippers to the extent of over \$140,000,000, or nearly \$8,000,000 a year, to pay for the inflation of the capital of these companies, and for the vicious practices that crept into their management."

Management of Stock.

contracted with themselves to build an extension of 103 miles. In payment they issued stock to the amount of \$8,000,000, and bonds to the amount of \$4,500,000, the market value of the stock and bonds being at the time \$8,349,000. The actual cost of construction was \$3,505,000, so that they personally profited by their own votes by that single transaction to the extent of \$4,834,000, etc., etc. Had the Pacific railroads been built and managed upon honest methods, had the Government loan been properly applied, these companies, regarded as a whole, could have declared dividends at the rate of 6 per cent. per annum for eighteen years, from the date of actual completion to the present time, upon all the moneys that they would have been required to pay in to complete and equip the roads; they would have owned 2495 miles of roads free from all debt, and worth \$124,700,000, upon an original outlay of less than \$35,490,381.44; three of them, the Union Pacific, Central Pacific, and Central Branch, could have repaid every cent of the principal and interest advanced by the Government to date, and could have reduced their charges to shippers to the extent of over \$140,000,000, or nearly \$8,000,000 per year. But they chose dishonest methods. At the outset they divided \$172,347,113 of fictitious capital, they dissipated over \$107,000,000 which should have been applied to the payment of the principal and interest of the Government debt, and they taxed shippers to the extent of over \$140,000,000, or nearly \$8,000,000 a year, to pay for the inflation of the capital of these companies, and for the vicious practices that crept into their management."

Concerning what the Government should now do in the premises there are many opinions, and various bills on the matter have been introduced into Congress. The Pacific Funding Bill of the last Congress proposed to exempt the estates of the incorporators, and to continue the Government's loan (\$138,000,000) for fifty years at 3 per cent. interest. To the Government it offered the concession of changing the Government's lien from the main lines of the roads to all the lines.

The opponents of the Funding Bill urged

that it was the duty of the Government as well as its right to prosecute its legal claims upon the stockholders of the companies which have defrauded it, and to dissolve the partnership with them. A part of the opponents were in favor of having the Government sell in the open market its property in the roads, and go out of the railroad business; the remainder were in favor of having the Government take up the first mortgage bonds, and either lease or operate the roads as Government property. The union of these two forces resulted in the killing of the bill by a vote of 177 to 106.

The opponents of the Funding Bill agreed with its advocates in just one thing. They admitted that the main lines of the Pacific roads are not worth half as much as the Government has advanced upon them. They insisted, however, that the financial interests of the Government and its moral interests both demand that the claims of the Government against the directors of the Central Pacific be prosecuted.

Mr. Richard T. Colburn, to whose article in the *Annals of the American Academy* for March, 1895, we are mainly indebted for the above facts, says that there are three courses which the Government can pursue:

I. It can relinquish the debt, except as repaid by current services.

II. Attempted foreclosure and possession, followed by transfer to new owners or lessees, or operation for Government account.

III. Extension of the debt at such rate of interest as the earnings will justify after providing for necessary prior fixed charges.

Of these courses, he says in brief:

"*First.*—Pleas have been made before Congressional committees, not without ingenuity, to have these debts waived and expunged, or rather commuted into a perpetual obligation to carry mails, troops, and supplies. Had this enterprise failed to pay its way, as was expected, or had its promoters paid every demand except only profits to the shareholders, there are many plausible and equitable reasons why a magnanimous course would be opportune. Nobody, however, has had the hardihood to formulate such a bill or report. On the other hand, there are more grave reasons why the claim should be treated as a valid debt, to be repaid to the last dollar. It will never do to set up the Treasury as a target to be aimed at on the principle of condoning failures. The Nicaragua Canal Company in some shape will be the next applicant for Treasury assistance, and no worse precedent (for its success) could be devised than to condone the debt to the Pacific Railroad Companies. It would be preferable to let it stand, tho it were indeed a hopelessly 'bad debt.'

"*Second.*—Nor is the expediency of resort to foreclose any more hopeful. As already stated, the right of the Government to take possession under this statutory mortgage is not clear. Beyond doubt its right to do so was in full force until the completion of the road was a fact or in plain sight. With the junction of the rails in May, 1869, that right lapsed forever, except in the improbable contingency of an abandonment or neglect (and then only to supply the omission), an event not likely to arrive unless by the complicity of the Government. Of course, it is within the sovereign power to take forcible possession of this railroad; subject, however, to the obligation to compensation for private property taken; but that is a general power not derivable under its statutory claim. . . .

"The practical situation is rather complicated than cleared by the assertion of this right of foreclosure. To begin with, the prior liens, equal in amount to the face of the subsidy, must be assumed, and either paid off or extended. Suppose they were to make common cause with the stockholders and claim the road itself, or demand their money, they could, with the same cash, turn round and parallel every essential portion

Foreclosure Considered.

of aided road, and ally themselves with branches and terminal lines on which the United States has no lien. No one knows this advantage better than the directors of these companies. Quite recently a new Pacific line (the Great Northern, the fifth on United States territory) has been completed to Puget Sound at a cost of one-third that of the original Union-Central line. Furthermore, who are to be the bidders at a sale, outside of the first mortgage holders and the Government? Much as the managers of railways quarrel among themselves for a division of freight money, there is too much *esprit du corps* among them for any responsible company to appear as a competitive bidder. It would, moreover, be in danger of speedy and condign punishment from the owners of these indispensable branches, feeders, terminal facilities, and tributary ocean steam lines. No one can afford to own the piece of railroad laid across these dry deserts and high mountains and which does not also have its own entrance to either Council Bluffs, Kansas City, Denver, or San Francisco. The nation is bound by honor and contract to respect the claim of outsiders to the extent of \$25,000 per mile for the Eastern portion of the main line, and about \$35,000 per mile for the Western portion.

"Foreclosure is not only no legal solution; it is no practical solution. It is the forerunner of mischief only. In his volume, giving a compact history of the work and its tribulations, entitled the *Union Pacific Railway*, Mr. John P. Davis, though accepting the right of foreclosure without question, in a concluding chapter as to its future, sums up the equities of the case very fairly and ably, and abundantly disposes of the expediency of it by showing the multiplied difficulties, perplexities, and expense of an attempt to operate the 2494 miles of road on which its claims rest. . . .

"One may have much sympathy with the people of California—a hundred thousand of whom petition to have the decision take this course. The evils they so eloquently portray, however, are those which other parts of the country share with them, to a greater or less extent. They see other communities enjoying the benefits of a sharp competition in rail-carriage, in through freights carried at bare train expenses, while the burden of fixed charges and administration is left to be sustained by local traffic; that is to say, a portion of the traffic of railroads (like the business of the Post-office, which tolerates no competitor) is done at less than the service costs; it is deemed better to have it, and keep the larger force of men and rolling-stock employed, than to lose it. The people of California would like the Government to provide them with this cheap carriage for their interior freights on the same basis as the overland business, which they now enjoy to the full, since private capital is unwilling to do so. The fares and freights in California itself are not high nor unreasonable, tried by any standard. This is the same grievance, cropping up in a hundred other places, which the Interstate Commerce Commission was organized to grapple with, but which it can do but little to alleviate.

"The suggestion emanating from the same State, that the Attorney-General should bring suit against the original directors of the railway companies, to recover large sums wrongfully obtained, is not a fortunate one. As a means of reimbursing these maturing claims, it is inadequate. This course was, in fact, tried years ago, as a sequel of the *Crédit Mobilier* scandal, before the Circuit Court at Hartford, when the Court ruled that it was for the Union Pacific stockholders, not the Government, to move, as they were the

Suit Against In- corporators.

parties wronged, if any. In like manner it is the stockholders of the Central Pacific (now for the most part in Europe) who are at liberty to bring suit, if anybody, for restitution of plunder, under this exceptional California statute made to curb the dishonesty of mining company officials, but easily evaded as to all. Will the stockholders do so? No; for the reason that it would be throwing away good money after bad; and, besides, they have to fear the possible hostility of the same men, or their successors, entrenched in power, and able to injure, even if dislodged. It is easy for the essayist, the lawyer, or the legislator, unfamiliar with the mysteries of Wall Street and railroad finance and management, to make charges, frame bills and indictments, but not so the practical work of negotiation and redress.

"An illustration (one of many drawn from the checked history of the Union Pacific Company) may serve to show how difficult is the situation in this subdued

railroad warfare, and how embarrassing at times is the choice of courses, with the best disposition to follow the ethically right. While the Union Pacific road was under construction, and J. Gould and J. Fisk were in full control of the Erie, the latter made an attempt to 'break into' the Union Pacific Company, the associate supposed to be in the background. Some years later, after they had been ousted from the Erie, Gould had acquired the Missouri Pacific, of which the Kansas Pacific (subsidized) was the natural prolongation toward Denver and the Pacific. By the Act of Congress the Union Company was required to operate the main line with the other Eastern branches 'as one continuous line.' It claimed that to charge the local rate from the Cheyenne Junction, midway of its length (which rate was, in many cases, higher than the rate throughout the entire Union Pacific line), was a sufficient compliance with the Act. Suits were carried from court to court, but in the meantime the Kansas road was being starved, its development cramped. Its stock went down to near zero and the first mortgages to 50. This was Gould's opportunity, which, with characteristic nimbleness and secrecy, he improved. He acquired enough stock of the Union to become a director, and all of the Kansas he could buy, in open market or privately. He was thus on both sides of the trade and informed of the counsels and plans of both parties. When it became imminent that the Supreme Court would have to decide in favor of the Kansas Company, he suggested a consolidation of the two. The other directors demurred—for obvious reasons—whereupon he replied, in effect: 'Very well, gentlemen; as you like; but if you refuse the Missouri and Kansas companies will build from Denver to Salt Lake and the Central terminus at Ogden, and then where will you be?' This alternative would have been a proper and feasible thing to do. His views prevailed, and the result was an exchange of share for share of stock, the assumption of the bonded and floating debt of the impoverished partner company, payment of deferred interest; in all a profit to the shrewd speculator and his friends of not less than ten millions, and perhaps nearer twenty.

"There would indeed be poetic justice, and also justice of the law and constitution, if some of these extorted gains could somehow be recovered for the unfortunate small stockholders, who are the parties really defrauded. The Government, as we shall presently see, may recover its entire claim without allowance for equitable set-off, but how and whence are the confiding shareholders to get back their money when a whole century's earnings are to be pledged to others in advance of them? True the Attorney-General has moved against the Stanford estate, ostensibly on behalf of this maturing claim of the Government, but it is likely that this was intended and understood by counsel more to 'stay waste' of the assets than in the hope of securing any part to the Treasury, and in this way the prosecution is a real service to the Stanford University, rather than an injury, as is sometimes alleged. Had all the great fortunes made out of this Government subsidy experiment been disposed of for objects as worthy, and placed in as enlightened and competent hands as this one, Congress and the public might indeed overlook or condone the irregularity of their acquisition.

"There is but one honorable way in which approximate justice may be done to all parties concerned in this Pacific Railroad venture, but, alas! it is not free from difficulties. If, notwithstanding the objections to government ownership, it is decided to take these defaulting companies' property, the only fair way is to authorize the Secretary of the Interior to purchase the stock of both, to be delivered within ninety days, at say \$50 per share, at which rate it would secure nearly all the \$68,000,000 of Central, and \$60,000,000 of Union, at a cost under \$64,000,000. This would double its original investment, but by careful nursing it might prove a judicious purchase, since it would carry control of four or five times the original aided mileage. The policy need not be urged on behalf of the shareholders, but on the ground of fairness. It is one of the curses of corporate management that out of it the managing directors can enrich themselves, while their confiding fellow-shareholders are impoverished. In this respect the Pacific Company officials have been conspicuous offenders. If the legislative favor is to be invoked on behalf of anybody besides the local patrons of the road, it may with equal reason be asked on behalf of defrauded and comparatively helpless investors in the stock, many of them women and orphans dependent upon the expected income, and none the less deserving because, living abroad,

they trusted to the honor and dignity of an American enterprise in which the Government itself was chief creditor.

"Third.—The Government would seem to be shut up to the third remedy. Compulsory or pursuing legislation is at best futile; the sovereign authority cannot be resorted to except as an extraordinary or war power; assignment of the stockholders' rights is hardly practicable, because it is but a first step in an untried policy looking far beyond the recovery of the debts. There remains the alternative of mutual accommodation. Valuable as are these lines of railway with their affiliated connections, in the hands of their owners; the cooperation of stockholders is necessary to meet these onerous claims. The margin between solvency and insolvency is too narrow to tolerate clashing or forcible measures. The nation being a large customer of the roads, is enabled to get some current return upon its outlay, the equivalent of a low rate of interest. By simply withholding the compensation for transport, it gets, taking a series of years together, a rate of $1\frac{1}{2}$ per cent. on the new debt (or 3 per cent. on the old); or, taking the corporations separately, about 2 per cent. from the Eastern and 1 per cent. from the Western; the disparity being caused by the double volume of public service accruing to the Union Company. An insurrection, or foreign war, might carry the yield much higher. In view of the equitable considerations above named, and the fact that whatever the amounts demanded, and time granted, the payments must be a tax upon the local traffic, is not this enough and a fair basis for commutation of interest?"

"How about the repayment of the principal? Some inducement should be provided for its early liquidation. The maturity of a fraction of the subsidy bonds does not alter the moral, nor seriously the legal, status of the parties. It is the duty of the nation to help the credit of its debtor where its own claims are not prejudiced thereby. It can grant an extension of time—a long time—without sacrifice, and as it can do nothing practicable but that, that should be done willingly and helpfully. This extension need not be as great as some of the bills before Congress provide, *viz.*, a fixed period of fifty or a hundred years, all of which is to be consumed in the process; but ought to be a maximum period of a hundred years, with an inducement to shorten the time. . . .

"The Union Pacific has for years been estopped from paying dividends. This has not benefited the United States a particle; it was a restraint applied by Congress years too late. The result might have been foreseen; high rentals, including guaranteed dividends of branch and tributary lines, wholesale construction of new lines with guarantees of interest, or 'constructive mileage' allowances. The profits have gone to insiders, while the entrapped investors have remained shorn just the same. The Oregon Short Line, the Northern Utah and Montana, the Denver and Gulf are specimens of the absurd competition with neighbor companies for territorial control. The receiver-ship will enable the insolvent to relieve himself of the excessive load of some of these burdensome leases, guarantees, and preferences; but others of them will have to be retained as a charge upon the main line for many years.

"The Reorganization Committee of the crippled Union Pacific bondholders, in which the Government is amply represented, is reported to favor the very customary device in such cases of a 'blanket mortgage,' covering main-line branches, and Treasury assets, of an amount large enough to cover all outstanding bonded debt, estimated at \$140,000,000, of which it is proposed to allot nearly one-half to the United States in lieu of its existing claim. The rate of interest on the latter is to be $\frac{1}{2}$ per cent., and on the other portions of the issue 4 and 5, according to the priority and merit of their present holdings. If the stockholders deliberately choose thus to advance the lien of the Government to that of coequality with the other bondholders and to postpone their hopes of returns for a century, it is an act of uncalled-for self-sacrifice. No one will complain, unless the first mortgage holders refuse to accept the security thus diluted. To carry out such a plan the Government must step in as guarantor that the entire loan shall be taken. Who else is to advance the money to non-assenting bondholders? As a dilatory device it may answer, but not as a settlement. It does not require the prophetic gift to foresee that this is practically an irredeemable issue."

Such is a conservative, tho informed and fair, view of the situation at the time when it was

written. In January, 1897, however, when the second mortgage bonds came to maturity, there was a violent discussion of the whole subject in Congress, and a proposition to extend the debt made by the railroads affected was defeated in the House January 11 by a vote of 168 to 102. There was nothing left for the administration but to order foreclosure in the courts. Since then various propositions have been made. It has been proposed that the Government keep the ownership of the roadbed and allow various railroads to run over it. It is more probable that a syndicate will buy the road.

PAINE, THOMAS, was born at Thetford, Eng., in 1737, the son of a Quaker stay-maker. He learned his father's trade, but did much private studying. In 1756 he served a short time on a privateer. In 1759 he married, but his wife died in 1760. In 1762 he obtained a post in the revenue service. In 1765 he was discharged for irregular conduct, but was restored the next year. Waiting for a vacancy, he taught school and preached. In 1771 he married the daughter of a deceased tobacconist at Lewis, and continued the tobacconist's trade. He published in 1772 *The Case of the Officers of the Excise*, which led to his discharge from the excise service in 1774. He also this year separated from his wife. Invited by Franklin, he now went to America, and soon found employment in Philadelphia as editor of the *Pennsylvania Magazine*. He wrote against slavery, and January 10, 1776, published his celebrated *Common Sense*, of which 120,000 copies were sold in three months. December 19, 1776, he published in the *Pennsylvania Journal* the first number of *The Crisis*, and continued the numbers irregularly through the war, exerting wide influence for independence and republicanism. In 1777 he was chosen secretary of the Committee of Foreign Affairs, but was dismissed and censured by Congress in 1779 for revealing secrets. He was soon after elected clerk of the General Assembly of Pennsylvania. He received in 1780 a degree from the University of Pennsylvania, and in 1781 went with Colonel Laurens to France and negotiated a loan, for which Congress gave him \$3000, and New York an estate, and Pennsylvania \$2500. In 1787 he went again to France and then to England, where in 1791-92 he published in London his *Rights of Man*, a reply to Burke, and defence of the French Revolution. France made him a citizen, and in 1792 he was elected deputy from Calais. He acted with the Girondists and opposed the execution of the king. He was imprisoned by Robespierre from 1793-94, narrowly escaping the guillotine. In prison he completed his *Age of Reason*, and published it when released in 1795. He again took his seat in the Convention and resided two years with James Monroe, United States Minister to France. In 1802 he returned to the United States in a United States sloop of war and was cordially received at Washington, New York, and Philadelphia. He was, however, opposed by the Federalists and branded by the orthodox as an atheist, tho he was really a free-thinking theist. He lived in comparative obscurity in New York, and died on his estate at New Rochelle in 1809.

PALGRAVE, ROBERT HARRY INGLIS, was born in London in 1827—the son of Sir Francis Palgrave, the well-known historian and author. His eldest brother is Francis Turner Palgrave, professor of poetry at Oxford. R. H. Inglis Palgrave was educated at Charterhouse, but early went to Great Yarmouth and entered a banking-house. Interested in economics, he won a prize, awarded in 1870 by the Statistical Society of London, for his essay, *Local Taxation of Great Britain and Ireland*. In 1877 he became associated with Mr. Bagehot on the *Economist*, and, on Mr. Bagehot's death, its editor. In 1882 he was elected Fellow of the Royal Society, and, in 1885, was appointed one of Her Majesty's Commission on the Depression of Trade and Industry. His most recent work is to edit the *Dictionary of Political Economy*, now being published by Macmillan & Co., London.

PANAMA CANAL.—From the time of the Spanish conquest of America a navigable connection between the Atlantic and Pacific has been desired. Many years of voyaging were needed before men gave up the idea of a natural strait between the two oceans somewhere in or near the Tropics. When, however, it was realized that a continuous continent lay across the pathway, attention was naturally turned to speculations on the best route for an interoceanic canal. The Isthmus of Panama furnishes the most obvious route, as is evident from the map. It is narrow and low, the summit level of the railroad which now runs across it being only 287 feet above sea-level. A survey of the Isthmus was made by a French engineer in 1843, and later by the chief engineer of the Panama Railroad, George M. Totten. This latter survey was afterward renewed by the United States Government, and a route marked out from the Bay of Aspinwall to Panama on the Pacific coast. On May 15, 1879, a congress of delegates from 24 countries, summoned by Count Ferdinand de Lesseps, met at Paris to decide upon a plan for an interoceanic canal. In order to have a canal without locks, the congress decided on the Panama route, the canal to run from Limon Bay to Panama. The Universal Interoceanic Canal Company was organized under French laws, and under a concession from the government of Columbia.

Their first estimate of the cost of the canal, made by the congress, was \$120,000,000. In 1883, however, \$200,000,000 had been expended, and only one-third of the work was completed. But much of the money had been wasted or embezzled, and it was found impossible to raise more. The work stopped in 1889. An official commission estimated that the completion of the canal would cost \$342,000,000, and in 1890 the receiver, who had been appointed by the French Government, estimated the remaining cost at \$600,000,000. All this was largely owing to corruption and mismanagement; and an investigation led the Government to prosecute certain directors of the Panama Canal Company, including Ferdinand de Lesseps and his son Charles, on charges of swindling. The defendants were

convicted; and an investigation in the Chamber of Deputies resulted in charging 11 directors, ex-ministers, deputies, and senators with bribery and corruption.

PANTALEONI, MAFFEO, was born in Frascati in 1857, and now, at the head of the Bari School of Commerce, is in the first rank of writers on taxation and other financial themes. Achille Loria (*Annals of the American Academy of Political and Social Science*, vol. ii., p. 216) says that his *La Teoria della Traslazione dei Tributi* investigates the reactions of taxes "with a marvelous acuteness, not equaled in the pages of any other Italian writer." In 1889 he published *Principii de economia pura*, which has been translated into English. His theory of value conforms in general to that of Jevons, but he has criticised alike the English and the Austrian school.

PAPER MONEY.—Money (*q.v.*), defined as the medium of exchange, may or may not have intrinsic value. When a piece of money itself apart from its stamp, is, of the commercial value stamped upon it, it is said to be *intrinsic* money, **Definitions**, having value in itself. When it has no value in itself, or no value which makes pretense of approximating to its stamped value, but simply represents a value which the government undertakes to pay out for it whenever demanded, it is called *representative* money. It represents value. When, however, its value is not equal to its stamped value, only because its intrinsic value has been depreciated voluntarily or otherwise, the originally its intrinsic and commercial value were the same, it is called, not representative money, but *depreciated* money. Its value has depreciated. Finally, when money is issued by a government stamped as legal tender for a certain value, but with no guarantee by the government that it will be redeemed for intrinsic money, it is called *irredeemable* or *fiat* money. The government makes it worth so much. It is both representative and fiat money that we consider in this article, because such moneys are to-day almost invariably made of paper, and all kinds of such money can be considered under the general title of "paper money." We shall consider, first, its history and then the principles and problems involved in its use.

HISTORY.

Representative money has a long history. The Carthaginians are said to have had a representative leather currency, and there is a tradition that there was such money used in Rome before the time of Numa. Jevons thinks that the Byzantine iron money was probably representative money. The leather currency, long in use in Russia, is believed undoubtedly first to have represented whole skins, and finally to have been circulated without any reference to the whole skins. China, however, is the country which first developed the use of representative money.

Representative money in the main, however, has been used only in times of special financial

pressure, as in times of war. Dionysius of Syracuse compelled the use of a tin money in place of silver worth four times as much. Timotheus of Athens, according to Aristotle, persuaded the soldiers to receive copper money in place of silver, promising to exchange it for silver when the war was over. Catherine II. of Russia issued paper in 1768 to replace the copper money. The State of Virginia placed tobacco in stores and used the receipts for money. Another form of paper money which, according to some, has played a large part in history, is the so-called bank money of the early Italian and German banks. All kinds of coins, many of them clipped and depreciated, being in use in the Middle Ages, the custom arose in the Italian republics, and notably at Venice, of the merchants depositing these coins in the banks, where their value

Bank Money. would be accurately estimated and a credit for the value given to the depositor, who could then check against this credit, and the credit be transferred to those receiving the checks. These checks or bank money were usually at a premium above gold. It is claimed by some believers in paper money that this bank money even circulated long after the money originally deposited had been issued as a forced loan to the government. The question, however, is somewhat involved and disputed. (See *BANK OF VENICE*; *BANK OF AMSTERDAM*.)

A somewhat similar system arose in England, when merchants, in order to gain greater security for their moneys, and, in part, to keep it from the government, deposited their moneys with the goldsmiths and used the receipts as representative money. It is probable that out of this system rose the modern English banks.

The best known instances of paper money in modern times are the French assignats, the issues of the American colonies, of the Continental Congress, and of the greenbacks in the War of the Rebellion. These will, however, be found described in special articles. (See *ASSIGNATS*; *CURRENCY*; *GREENBACK PARTY*.) Less known is the issue of token money, by merchants as late as the eighteenth century in England, serving as promissory notes to pay money.

Coming now to a consideration of the principles and problems involved in the use of paper money, it may be said, first, that most orthodox economists believe in the use of paper money only as representative of intrinsic money, such as the gold and silver certificates of the United States or the Bank of England, which are usually "as good as gold," and must always be paid in gold, if desired, by the Bank of England, except when in times of panic the government allows the bank to pay in paper. Professor Hadley represents this, the usual conservative view, when he says (*Johnson's Cyclo-pædia*, article "Money"):

"When bank notes or Government notes become currency, without a corresponding basis of money, nothing has ever been able to prevent their fluctuation in value and the consequent effect upon all other values. The temptation to increase these issues according to the fancied interest of the bank or Government is always likely to prove irresistible, in consequence of which the community employing them finds itself flooded with a currency upon which all values

float with an unsteady motion, and any standard of value is out of the question."

Provided, however, that the paper money always does really represent intrinsic money, which can be paid for it at any time, most economists prefer paper money to metallic because it is easier to handle and to convey.

Many economists, too, think it perfectly safe to use paper money redeemable in gold or silver (for the question between gold and silver, see *BIMETALLISM*; *GOLD*; *SILVER*), but issued slightly in excess of the amount of gold and silver. The reason for this is that they consider it all but impossible that all the paper issued should be presented for redemption at one time, and that therefore if any paper that will be presented can be redeemed on demand, it will all be kept at par. Just how far it is safe to issue paper beyond money to redeem it is debated. Jevons says concerning the various methods of the issue of paper money (*Money and the Mechanism of Exchange*, chap. xviii.):

Different Systems.

"This question is perhaps the most vexed and debatable one in the whole sphere of political economy; but, by careful adhering to the analysis of facts, we may, perhaps, get a view of the subject free from the great perplexities in which it is commonly involved. The elementary principles of the subject are not of a complex character; and if we hold tenaciously to those principles, we may perhaps be saved from that dangerous kind of intellectual vertigo which often attacks writers on the currency.

"The State may either take the issue of representative money into its own hands, as it takes the coining of money, or it may allow private individuals, or semi-public companies and corporations to undertake the work under more or less strict legislative control. We will afterward briefly consider the relative advantages of Government and private issues, but in either case we may lay down the following series of methods, according to which the amount of issue may be regulated and the performance of the promises guaranteed.

"1. *The Simple Deposit Method.* The issuer of promissory notes may be obliged to keep a stock of coin and bullion constantly on hand, equal in amount to the aggregate of the uncanceled notes, each of which, being instantly paid on presentation, will produce a corresponding decrease of the reserve.

"2. *The Partial Deposit Method.* Instead of being obliged to keep the whole of the precious metals deposited in his vaults, the issuer may be allowed to invest a fixed amount in Government funds, or other safe profitable securities.

"3. *The Minimum Reserve Method.* The issuer may be bound to have on hand under all circumstances a fixed minimum amount of coin and bullion.

"4. *The Proportional Reserve Method.* The reserve may be made to vary with the amount of outstanding notes, being, say, at least one-third or one-fourth of the total.

"5. *The Maximum Issue Method.* Permission may be given to issue notes not exceeding in the aggregate a fixed amount, prohibitory penalties being imposed upon any breach of this restriction.

"6. *The Elastic Limit Method.* A limit may be assigned to the aggregate amount of notes, as in the last method, but the penalties on the excessive issuer may be intentionally made so slight that the issuer will under some circumstances prefer to pay the penalty rather than restrict his issues.

"7. *The Documentary Reserve Method.* The reserve of property which the issuer is required to keep may consist, not of gold or silver coin or bullion, but of Government funds, bonds, shares, or other documentary securities.

"8. *The Real Property Reserve Method.* Instead of merely documentary property, the issuer may be allowed to treat various property, such as land, houses, ships, railway shares, etc., as his reserve of wealth to meet engagements.

"9. *The Foreign Exchanges Method.* Some important Bank may be allowed to issue convertible notes

on the understanding that it will not increase the amount in circulation so long as the foreign exchanges are against the country, and render the export of specie profitable.

"10. *The Free Issue Method.* The business of issuing promissory notes may be left open to the free competition of all individuals, free from any restrictions or conditions, except such laws as apply to all commercial contracts and promises.

"11. *The Gold Par Method.* Paper money may be issued, bearing the appearance of promissory notes, but inconvertible into coin. The issue being restricted as long as any premium on gold is apparent, the paper money may be thus maintained equal in value to the coin which it nominally represents.

"12. *The Revenue Payments Method.* Inconvertible paper money may be freely issued, but an attempt may be made to keep up its value by receiving it in place of coin in the payment of taxes.

"13. *The Deferred Convertibility Method.* Notes may be issued promising to pay metallic money at some future day, either definitely fixed or dependent upon political or other contingent events.

"14. *The Paper Money Method.* Lastly, those who coin apparent promissory notes may be entirely absolved from the performance of their promises, so that the notes circulate by force of habit, by the command of the sovereign, or in consequence of the absence of any other medium of exchange.

"Altho I have, in the above statement, enumerated no less than fourteen distinct methods of managing the issue of paper currency, it is by no means certain that other methods have not been employed from time to time. There may be, in fact, an almost unlimited number of devices for securing the performance of promises, or for rendering the performance unnecessary. Moreover, these methods may be combined together in almost unlimited variety. The reserve may be required to be partially in the form of specie and partially in documentary securities, or real property. A banker may be allowed to issue a certain fixed amount of notes without any condition as to reserves, and to issue further notes on the Deposit Method.

The advantage of the first system is that so long as it is honestly conducted, coin can always be paid for the paper, and so confidence can be kept up, while the inconvenience and abrasion of the metal are avoided. But, on the other hand, a vast amount of metal is kept uselessly locked up, and the very fact that it lies there tempts the government to seize it for some use. This has been the result of most of the early instances of this method, as mentioned above, in Italy, Germany, and England.

The second plan is illustrated by the Bank of England under the Bank Act of 1844 and the recently constituted bank system of Germany.

It is safe under ordinary circumstances, but its critics claim that it gives an undue monopoly to a favored few, and produces at times terrible panics because the value of the currency changes with the demand for the currency, and cannot readily change to suit the demand because limited by the metal at its basis.

The minimum reserve method and the proportional reserve method are adopted in the United States national bank system; but the reserve cannot be touched just when it is most needed, and the terrible panics of the United States show that it does not prevent great evil.

The fifth system, the maximum issue method, is adopted in England in the 170 banks allowed to issue notes. Jevons inclines to favor this; but the believers in the evils of an unelastic currency argue that it can never be made elastic enough to prevent disastrous panics and changes in value. The sixth, or elastic limit system, is now in use in Germany, and obviates the defects of the previous system in part, and Jevons considers it an improvement, but it

leaves parties who may be interested in forcing or allowing a panic to do so if they will.

The seventh method, or that of documentary reserve, is a variation of the others; the sale of reserves may be forced just when to do so would create rather than allay panic.

Real property reserve is thought by many to be a better system. It lay at the basis of the French assignats, and is involved in most forms of fiat money; but land cannot always be sold on short notice, and may vary in value. The method of regulation by the foreign exchanges is simply a system of serving notice when the paper has been issued to an extent that makes it less valuable than metal.

The free issue system is advocated by some extreme individualists; but while with honest parties and wise parties it might work well, unwise or dishonest parties might take advantage of it and wrong the innocent and unsuspecting. The gold par method is the method which has prevailed in the Bank of France since the Franco-Prussian War, and Jevons declares it to have worked well, and adds that it might work well so long as the issue of paper be restricted so soon as gold rises in par above paper; but he considers it a dangerous system, and that such a power has rarely been wisely used. Yet he says that the French notes have not depreciated more than $\frac{1}{4}$ or 1 per cent.

The twelfth system is that of the American greenbacks of the War of the Rebellion. (See CURRENCY.)

The thirteenth system is the one usually adopted by revolutionary governments, and its value naturally depends on the value of the government that issues them.

The last system is so important that we quote Jevons's words. He says:

"Finally we come to the undisguised paper money issued by government and ordered to be received as legal tender. Such inconvertible paper notes have in all instances been put in circulation for convertible ones or in the place of such, and they are always expressed in terms of money. The French *mandats* of 100 francs, for instance, bear the ambiguous phrase, *Bon pour cent francs*. The wretched scraps of paper which are circulated in Buenos Ayres are marked *Un Peso, Moneda Corriente*, reminding one of the time when the peso was a heavy standard coin. After the promise of payment in coin is found to be illusory the notes still circulate, partly from habit, partly because the people must have some currency and have no coin to use for the purpose, or, if they have, carefully hoard it for profit or future use. There is plenty of evidence to prove that an inconvertible paper money, carefully limited in quantity, can retain its full value. Such was the case with the Bank of England notes for several years after the suspension of specie payments in 1797, and such is the case with the present notes of the Bank of France.

"The principal objections to an inconvertible paper currency are two in number.

"1. The great temptation which it offers to over-issue and consequent depreciation.

"2. The impossibility of varying its amounts in accordance with the requirements of trade.

"It is hardly requisite to tell again the well-worn tale of the over-issue of paper money, which has almost always followed the removable of the legal necessity of convertibility. Hardly any civilized nation exists, excepting some of the newer British colonies, which has not suffered from the scourge of paper money at one time or another. Russia has had a depreciated paper currency for more than a hundred years, and the history of it may be read in M. Wolski's work on the finances of Russia. Repeated limits were placed to its issue by imperial edict, but the next war always led to further issues. Italy,

Inconvertible Paper Money.

Systems Discussed.

Austria, and the United States, countries where the highest economical intelligence might be expected to guide the governments, endure the evils of an inconvertible paper currency. Time after time in the earlier history of the New England and some of the other States now forming parts of the American Union, paper money had been issued and had wrought ruin. Full particulars will be found in Professor Sumner's new and interesting *History of American Currency*. Some of the greatest statesmen pointed to the results; and Webster's opinion should never be forgotten. Of paper money he says: "We have suffered more from this cause than from every other cause or calamity. It has killed more men, pervaded and corrupted the choicest interests of our country more, and done more injustice than even the arms and artifices of our enemy."

"The issue of an inconvertible money, as Professor Sumner remarks, has often been recommended as a convenient means of making a forced loan from the people, when the finances of the Government are in a desperate condition. It is true that money may be thus easily abstracted from the people, and the government debts are effectually lessened. At the same time, however, every private debtor is enabled to take a forced contribution from his creditor. A government should, indeed, be in a desperate position which ventures thus to break all social contracts and relations which it was created to preserve.

"A further objection to a paper money inconvertible into coin is that it cannot be varied in quantity by the natural action of trade. No one can export it or import it like coin, and no one but the Government, or banks authorized by Government, can issue or cancel it. Hence, if trade become brisk, nothing but a decree of the Government can supply the requisite increase of circulating medium, and if this be put afloat and trade relapse into dulness, the currency becomes redundant and falls in value. Now, even the best informed government department cannot be trusted to judge wisely and impartially when more money is wanted. Currency must be supplied like all other commodities, according to the free action of the laws of supply and demand.

"Some persons have argued that it is well to have a paper money to form a home currency, which cannot be drained away, and will be free from the disturbing influences of foreign trade. But we cannot disconnect home and foreign trade except by doing away with the latter altogether. If two nations are to trade, the precious metals must form the international medium of exchange by which a balance of indebtedness is paid. Hence, each merchant in ordering, consigning, or selling goods must pay regard, not to the paper price of such goods, but to the gold or silver price with which he really pays for them. Gold and silver, in short, continue to be the real measure of value, and the variable paper currency is only an additional term of comparison which adds confusion."

So far Jevons. It will be seen that his main objections to inconvertible paper money are not so much to its use as to the danger of its misuse or the (asserted) impossibility of its wise use. Most orthodox economists argue in the same way. J. S. Mill says (*Principles of Political Economy*, bk. iii. chap. xiii.):

"After experience had shown that pieces of paper, of no intrinsic value, by merely bearing upon them the written profession of being equivalent to a certain number of francs, dollars, or pounds, could be made to circulate as such, and to produce all the benefit to the issuers which could have been produced by the coins which they purported to represent, governments began to think that it would be a happy device if they could appropriate to themselves this benefit, free from the condition to which individuals issuing such paper substitutes for money were subject, of giving, when required, for the sign, the thing signified. They determined to try whether they could not emancipate themselves from this unpleasant obligation, and make a piece of paper issued by them pass for a pound, by merely calling it a pound and consenting to receive it in payment of the taxes. And such is the influence of almost all established governments that they have generally succeeded in attaining this object. I believe I might say they have always succeeded for a time, and the power has only been lost

Mill's Views.

to them after they had compromised it by the most flagrant abuse.

"In the case supposed the functions of money are performed by a thing which derives its power of performing them solely from convention. But convention is quite sufficient to confer the power, since nothing more is needful to make a person accept anything as money, and even at any arbitrary value, than the persuasion that it will be taken from him on the same terms by others. The only question is, what determines the value of such a currency, since it cannot be as in the case of gold or silver (or paper exchangeable for them at pleasure) the cost of production."

Mill then goes on to show that the value of such a currency must depend on its quantity, that it can be safely used, if kept within quantities that would keep it at par with bullion; but he considers its advantages too slight to balance the danger of overissue. He says:

"But a still stronger consideration is the importance of adhering to a simple principle, intelligible to the most untaught capacity. Everybody understands convertibility; every one sees that what can be at any moment exchanged for five pounds is worth five pounds. Regulation by the price of bullion is a more complex idea, and does not recommend itself through the same familiar associations. There would be nothing like the same confidence, by the public generally, in an inconvertible currency so regulated as in a convertible one; and the most instructed person might reasonably doubt whether such a rule would be as likely to be inflexibly adhered to. The grounds of the rule not being so well understood by the public, opinion would probably not enforce it with as much rigidity, and, in any circumstances of difficulty, would be likely to turn against it, while to the Government itself a suspension of convertibility would appear a much stronger and more extreme measure than a relaxation of what might possibly be considered somewhat artificial rule. There is, therefore, a great preponderance of reasons in favor of a convertible in preference to even the best regulated inconvertible currency. The temptation to overissue, in certain financial emergencies, is so strong that nothing is admissible which can tend, in however slight a degree, to weaken the barriers that restrain it."

Professor F. A. Walker sees the danger of inconvertible paper money; yet of its possible wise use he says (*Money, Trade, and Industry*, p. 210):

"After looking at this subject from every side, I am at a loss to conceive of a single argument which can be advanced to support the assertion of the economists, that paper money cannot perform this function of measuring values, so-called. On the contrary, it appears to me clear, beyond a doubt, that just so long and just so far as paper money obtains and retains currency as the popular medium of exchange, so far and so long it does and must act as the value denominator or common denominator in exchange. And I see no reason to believe that, in this single respect, hard money, so-called, possesses any advantage over issues of any other form or substance which secure the degree of general acceptance which is necessary to constitute them money."

He says, further, on p. 214:

"Such money, so long as its popular acceptance remains undiminished, performs the office of a standard of deferred payments well or ill, according as its amount is regulated."

Such being the view of paper money held by the orthodox economists, many writers, and among them not a few economists of repute and not radical in their views on other questions, believe that it is possible to have inconvertible paper money that will not be abused. They argue that paper money is *the best money*, provided that the amount of its issue can be wisely controlled. Money, all writers admit (see CONTRACTION AND EXPANSION OF CURRENCY) is affected in its value by its *quantity, in proportion to the demand for it*. If the amount

of money expands beyond the needs or consuming power of the people, its value depreciates. If it is contracted, its value appreciates. Now, one use of money being to furnish the standard for deferred payments, all economists are agreed that honest money should be invariable *in value*, so that he who loans or borrows \$100 should, when he comes to settle the loan, neither receive nor pay more or less value than was loaned. But since the value of money varies with its quantity in proportion to the demand, a money to remain invariable *in value* must vary *in quantity* in proportion to the demand, expanding in exact proportion to the demand, or contracting as the demand contracts. If this could be always so, money would be (at least as far as this question is concerned) an invariable currency. The problem, therefore, is to obtain an *elastic* currency that shall be *invariable in value* by varying exactly with the demand for it. Disbelievers in paper currency believe it to be impossible; believers in paper currency believe that paper money can be so used and is the only money that can be so used, or, at the least, the easiest currency to use. For such use of paper money various plans are proposed. These plans are usually one form or another of adopting what is termed "a multiple standard" (*q.v.*). Even Jevons seems to favor this plan, although pointing out its dangers. He says (*Money and the Mechanism of Exchange*, chap. xxv.):

"The so-called double standard system of money spreads the fluctuations of supply and demand of gold and silver over a large area, and maintains both metals more unchanged in value than they would otherwise be. Can we not conceive a multiple legal tender which would be still less liable to variation? We estimate the value of £100 by the quantities of corn, beef, potatoes, coal, timber, iron, tea, coffee, beer, and other principal commodities which it will purchase from time to time. Might we not invent a legal tender note which should be convertible, not into any one single commodity, but into an aggregate of small quantities of various commodities, the quantity and quality of each being rigorously defined? Thus a hundred-pound note would give the owner a right to demand 1 quarter of good wheat, 1 ton of ordinary merchant bar iron, 10 pounds weight of middling cotton, 20 pounds of sugar, 5 pounds of tea, and other articles sufficient to make up the value. All these commodities will, of course, fluctuate in their relative values; but if the holder of the note loses upon some, he will in all probability gain upon others, so that, on the average, his note will remain steady in purchasing power. Indeed, as the articles into which it is convertible are those needed for continual consumption, the purchasing power of the note must remain steady compared with that of gold or silver, which metals are employed only for a few special purposes.

A Multiple Legal Tender.

"In practice, such a legal tender currency would obviously be most convenient, since no one would wish to have a miscellaneous assortment of goods forced into his possession. He who wanted corn would have to sell to other parties the iron, beef, and other things received along with it; gold, or other metallic money, would doubtless be used as the medium in these exchanges. This scheme would, therefore, resolve itself practically into that which has been long since brought forward under the title of the Tabular Standard of value."

Jevons then goes on to describe different forms of this tabular standard involved in what is now called the multiple standard, and the essence of which is that no one commodity should be used as a monetary standard, but that a value should be averaged from a multiple of commodities. He then says:

"The difficulties in the way of such a scheme are not considerable. It would, no doubt, introduce a certain complexity into the relations of debtors and creditors, and disputes might sometimes arise as to the date of the debt whence the circulation must be made. Such difficulties would not exceed those arising from the payment of interest, which likewise depends upon the duration of the debt. The work of the commission, when once established and directed by Act of Parliament, would be little more than that of accountants acting according to fixed rules. Their decisions would be of a perfectly *bona fide* and reliable character, because, in addition to their average results, they would be required to publish periodically the detailed tables of prices upon which their calculations were founded, and thus many persons could sufficiently verify the data and the calculations. Fraud would be out of the question.

Difficulties of the Scheme.

"The only real difficulty which I foresee is that of deciding upon the proper method of deducing the average. Whatever method were adopted, however, the results would be better than if we continued to accept a single metal for the standard, as we do at present.

"The space at my disposal will not allow me to describe adequately the advantages which would arise from the establishment of a national tabular standard of value. Such a standard would add a wholly new degree of stability to social relations, securing the fixed incomes of individuals and public institutions from the depreciation which they have often suffered. Speculation, too, based upon the frequent oscillations of prices, which take place in the present state of commerce, would be to a certain extent discouraged. The calculations of merchants would be less frequently frustrated by causes beyond their own control, and many bankruptcies would be prevented. Periodical collapses of credit would no doubt recur from time to time, but the intensity of the crisis would be mitigated, because, as prices fell, the liabilities of debtors would decrease approximately in the same ratio."

More recently Professor E. B. Andrews, in his *An Honest Dollar*, makes a strong plea for such a multiple standard, and in the appendix to his book gives much consideration to its details. Many other economists favor this plan, at least when the community is educated to adopt it.

It is under such form that most of the advocates of paper money are now advocating the adoption of paper or fiat money. They argue that intrinsic money never can be elastic enough to suit the changes in the demand for money, and hence that only fiat money, properly limited and used as under the multiple standard system, can be honest money. An inelastic currency, they say, must rob either creditors or debtors. In times of panic and financial pressure even now, they say, the community has to resort to paper money. In panics a special act of Parliament allows the Bank of England to pay in paper. In times of panic the New York banks use Clearing House certificates. In times of depression most Western States pay salaries in receipts which are made payable for taxes.

Many believe that this system could be adopted in the conduct of public work on the so-called Guernsey plan, of which Jevons says (*Money and the Mechanism of Exchange*, chap. xvi.):

"Daniel le Broc, the governor of the island, determined to build a market in St. Peters, but not having the necessary funds, issued under the seal of the island 4000 market notes for one pound each, with which he paid the artificers. When the market was finished and the rents came in, the notes were thereby canceled, and not an ounce of gold was employed in the matter. There is, however, no mystery in this advantage of paper money.

"Daniel le Broc, by issuing his market notes, drove an equivalent amount of gold out of circulation, and thus effected a kind of forced loan out of the metallic currency of the island, without paying any interest for it. A similar gain of interest accrues upon all paper notes so far as their amount exceeds the gold held in readiness to pay them. The private and joint-stock banks of issue in England in this way enjoy the interest upon a sum of about six millions and a half sterling, the Scotch banks upon two millions and three-quarters, and the Irish banks upon more than six millions. The issue of paper representative money is beneficial to all parties, provided that it is conducted upon a sound method of regulation."

Such are the main views held by economists as to the practicability of a paper currency. (See also MULTIPLE STANDARD.) (For the views of "Greenbacks," see GREENBACK PARTY; see also FIAT MONEY. For the importance of the question to-day, see CONTRACTION AND EXPANSION OF CURRENCY. For the historical questions involved as to the United States, see CURRENCY. For the proposition of the socialist as to the use of labor checks for money, see LABOR CHECKS.)

PARIS.—Paris, to the social reformer, suggests revolution and the struggles of the Commune, but it has something to teach in its present as well as in its past. (For its history see FRANCE AND SOCIAL REFORM AND PARIS, COMMUNE OF.) It was the first city to illustrate to the world the advantages of symmetry, spaciousness, order, and convenience in the planning of its streets; of wholesomeness and cleanliness and light in its municipal arrangements. It is, however, in spite of this, the most crowded city of the world. On its 19,200 acres live 2,269,023 persons, making a density of 117 persons to the acre, while Berlin, the next most crowded, has only 85, and New York, the next, has 60, while London has only 51. Paris' broad streets and boulevards have been built too often by driving the poor into crowded, narrow streets. The organization of the municipality is unique even in France. Alone among French cities Paris has no mayor, this being due to the fear the Government has of the revolutionary tendencies of the Paris Commune. The city is ruled, as a whole, by the prefect of the department of the Seine, and by his colleague, the prefect of the police. There is, however, a municipal council with considerable power, and 20 wards or *arrondissements*, over each of which presides a *maire* in a ward building called the *mairie*. The prefect of the police has, perhaps, the greatest power. He has vast sums at his disposal, of which he need render small account, and governs not only the ordinary police force, but the *police judiciaire*, the detective force, and the political police, the Government's secret agents, an inheritance of power from the Napoleonic administration, characteristically preserved by the Bourgeois Republic. He is only prevented from being despotic by the perfect clock-work organization of the departments of the city.

Paris is considered by Albert Shaw, to whose study in *The Century Magazine* for July, 1891, we are mainly

indebted for the information in this article, the best lighted city in the world. It is lighted by six gas companies (fused, however, together as one), each having a section of the city to itself, and all being under careful municipal direction and control. The companies must furnish gas to individuals at a price not exceeding a fixed maximum; they must furnish it for public use practically at cost; they must pay tax; cannot water stock; after paying 13½ per cent. dividends on its net profit, they must divide profits with the city; at the expiration of the charter all rights revert to the city, which also becomes owner of all the subways, piping, etc., that pertain to the plant. The city's share in the profits has so increased that it brings in a large revenue. For several years past it has amounted to some 20,000,000 frs. Paris thus gets her public lighting at cost, and 20,000,000 frs. a year into the bargain. Electric lighting, however, is replacing gas lighting. "A few months hence," says Mr. Shaw, writing July, 1891, "the whole city of Paris will have been laid with a network of electric lighting cables, and traffic on the sidewalks and in the streets will have suffered a minimum of obstruction, while no injury whatsoever will have been done to the pavements." There are no obstructive wires in Paris. In crossing streets it is forbidden to touch the pavement, and underground connection is made from the manholes of the sewers. "In our field of electrical methods," said a prominent American electrician to Mr. Shaw, "we are now five years behind the Continent."

Municipal Works.

"Paris," says Mr. Shaw, "has at its command a larger and more brilliant array of engineering and architectural talent than all the important cities of the United States taken together." The problem of transit in Paris has not been much worked out, on account of its density, and most workmen live in high stories over their shops. Its omnibuses and cars are ponderous and slow, but it is characteristic that they are operated upon the most mechanical system. The Paris water supply is operated and its plant owned by the city. The city sewers have been long famous. At present one-fifth or more of the total sewage affluent is carried to a fertilizing farm at Gennevilliers, with the best possible results, and in due time the whole sewage will be thus used.

Paris has given 10 of her 30 square miles to parks, the population being crowded into the remaining 20. The city is a "commune," and they have much that is communal. The city spends from 250,000,000 to 300,000,000 frs. every year, —\$25 for every man, woman, and child,—twice as much as Berlin and Vienna. A large share of this goes for municipal improvements or interest on investments in past improvements. The city has a vast debt, but one which is rapidly diminishing. "Assuming 125 francs from each citizen," says Mr. Shaw, "12 goes to the police department, 3 for cleaning and sprinkling streets, 3½ for public lighting, half a franc for protection against fire, 10 for education, 10 for hospitals and poor relief, from 8 to 10 for maintaining ways of communication, 5 for new streets, 40 for interest on debt, the remainder for salaries and minor expenses. These expenditures are enormous, compared with most cities, but they get enormous good from them. "Probably no other city in the world," says Mr. Shaw, "secures equally advantageous results from the outlay upon schools. Compulsory education makes school attendance all but universal. It has a marvelous system of industrial and trade schools for both sexes." It is in these schools that Parisian dressmakers, milliners, artificial-flower makers, furniture designers, house decorators, skilled workers in metals, and handicraftsmen in scores of lines of industry are educated to do the things that keep Paris prosperous and rich." The higher schools of science, classics, engineering, and art are proverbial.

The Mont de Piété, or municipal pawnshop, is a characteristic feature. "It has saved," says Mr. Shaw, "millions of francs for the poor of Paris." The municipal hospitals, retreats, and savings banks are equally effective. The city owns the great markets, and carefully supervises and inspects all departments of food supply. Private slaughter-houses are forbidden. Says Mr. Shaw: "If Paris spends vast sums in her municipal housekeeping, she has diverse magnificent and permanent results to show, and her people are, as I believe, enriched rather than impoverished by their common investments as a municipality."

Reference: Mr. Albert Shaw's *Municipal Government in Continental Europe*.

PARIS, COMMUNE OF.—The commune in France is a territorial division under a mayor, or a municipal government. (See COMMUNE.) The commune of Paris is of special importance, because several times the people of Paris have risen in rebellion against the General Government, and have tried to establish a communal self-government, to be federated with other self-governed communes. This is the ideal of the so-called communards or communalists of France, or those socialists who hold that the commune should be the political unit. (See FRANCE AND SOCIAL REFORM.) In 1566 Stephen Marcel, during the English invasion, endeavored to form a confederation of sovereign communes with Paris as the governing head. In 1588 the commune of Paris did succeed in obtaining independent self-government for six months. May 21, 1791, the Revolutionary Committee of the insurrection of July, 1789, replaced the town council, and took the name of "Commune of Paris." It had great power under Robespierre, but fell with him, July 14, 1794, and was replaced by 12 municipal divisions. Partly as a result of this, Paris to-day has no mayor of the whole city, being largely ruled by the General Government. (See PARIS.) Once again, on March 18, 1871, Paris rose in revolt against the then newly established Republic, and declared the Commune March 28. It seemed an opportune time to the leaders. France had been defeated by Germany; Paris, after a long siege, had been occupied by the Germans, but now they were gone; a Republic had been established, but the communards believed it to be a weak, sham, corrupt affair of the bourgeoisie. The communards declared that the Republic had sold Paris to the Germans. They therefore rose and declared the Commune. Similar risings, instigated in part by Bakounin and the anarchist communists, took place in Marseilles and other French cities, but were quickly suppressed. In Paris was the main success. The leaders of the Commune were Flourens, Félix Pyat, Assi, Delascluze, Paschal, Grousset, General Cluseret, Dombrowski, Arnauld, Vallès, Blanqui, and Rochefort. A large part of the National Guard of Paris declared for the Commune, with headquarters at Belleville and Montmartre. March 26 an election was held to choose the members for the communal government; 180,000 votes were cast. The republican government at Versailles sent an army to suppress the Commune. Under the command of Marshal MacMahon this army besieged Paris. April 5 the communards arrested Darboy, Archbishop of Paris, and other prisoners, and held them as hostages. The Commune declared its principles to be absolute individual liberty by the means of the suppression of government, and the division of nationalities into communes more or less federated. The present holders of capital were to be dispossessed, with compensation, and the land and capital were to be divided among associations of workmen. An English socialist who was in Paris during the Commune declares that Paris was never so free from want, crime, or vice. Enthusiasm reigned among the working-

classes and many of all classes joined the popular cause. But gradually dissension arose and mistakes were made. The besieging army took many forts, and finally entered Paris, 90,000 strong, on May 22. The communards resisted for five days in the streets. The republican army having put many prisoners to death, the communards retaliated by shooting Archbishop Darboy and other hostages. Terrible reprisals were made on both sides. The communards being finally defeated, and losing power, took revenge by burning the Tuileries, the Palais de Justice, the Palais Royal, the Hôtel de Ville, and other buildings connected with the hated Government. This act and the shooting of the archbishop and other captives have been laid to their charge, but it must not be forgotten that the triumphant republicans shot the communards down by the thousand in cold blood, burying them in prepared ditches. Twenty-five thousand communards were taken prisoners and many thousands deported. The leaders were mainly executed.

References: Sempronius' *Histoire de la Commune de Paris*; Moriac's *Paris sous la Commune*; Lissagaray, *History of the Commune of 1871* (a translation) gives the communards' side.

PARKHURST, CHARLES HENRY, D. D., was born in Framingham, Mass., in 1842. He had the usual common-school education, and at first looked forward to a mercantile career, entering a dry-goods store at the age of 16, but spending his leisure in continuing his studies. This enabled him, after two years of preparation at Lancaster Academy, Massachusetts, to enter Amherst College.

His favorite studies were metaphysics, mathematics, and philosophy; his scholarship of the highest grade. After graduation he took the principalship of the Amherst High School, then the chair of Latin and Greek at Williston Seminary, East Hampton. Dr. Parkhurst's married life began at this period with a wedding journey to Europe, and two years' study in theology at Halle, under the instruction of Tholuck, at Leipsic and Bonn. When in the Academy at Amherst he had consulted President Seelye as to his next step, and President Seelye had said, "Preach; it will do you good, if not others." This advice was followed, and in 1874 a church at Lenox, among the Berkshires, was his first charge. In 1879, a vacancy occurring in the Madison Avenue Church, a call was sent to Dr. Parkhurst and accepted.

From the first, Dr. Parkhurst commanded attention as a preacher and a thinker, but he is best known through his connection with the Society for the Prevention of Crime. This society was organized in 1878, for the object of the prevention of crime, and, as far as practicable, the eradication of the sources of crime and vice, by all suitable and legal methods. Howard Crosby was chosen president, and became its controlling spirit. On the reorganization of the society on the death of Dr. Crosby, in 1892, Dr. Parkhurst was chosen to the presidency. The present policy of the society is best stated in his words: "Till the alliance is broken which exists between the criminals and their proper prosecutors, it is

bailing out water with a sieve to attempt the extinguishment of individual gambling or disorderly houses. If the police would do what the public pays them for doing, we would disband and be glad to. The very existence of such a society as ours is, properly interpreted, a standing indictment of police incompetency or criminality." At first he was unwilling to accept the position, but accepted, with the following conditions: "If you mean to pursue your old course of taking individual cases of crime, I will not be your president, but if you are willing to fight the police as the guardian angels of crime, I am in it for all I am worth."

In February, 1892, Dr. Parkhurst preached a sermon which at once brought him into notoriety, from the fearless attack on the corruption of Tammany. He was at once challenged to prove his statements, and the enemies of good government supposed that this mere demand would cause him to retract his statements. The doctor was obliged to admit that his statements were based on hearsay, but he reasoned that they must be pretty well founded on fact, if their announcement created such an outcry. He determined that the next time he preached on misrule, he would be in possession of the facts, and about a month later, a second sermon was preached, based on facts in his actual knowledge. He was severely criticized for entering houses of ill-repute, in order to secure legal testimony, but he did not falter. He now had legal proof of what before was moral proof. His statements caused intense excitement, particularly his denunciation of the police department. Universal interest was aroused. In 1894 the Lexow investigating committee began an official inquiry into the alleged corruption in the police department. The clues gained by the Society for the Prevention of Crime were placed at its disposal, and the results of investigation were due in no small measure to the untiring energy and persistence of Dr. Parkhurst, because he knew that the police department as then constituted was corrupt.

At Dr. Parkhurst's request, Mr. John W. Goff, who was of a different political party from himself, was made chief counsel for the prosecution, and did able work.

As a result gross evils were proved, not only in the police department, but in the judicial. Dr. Parkhurst proved himself thoroughly able to sustain his side and organize the battle. When Superintendent Byrnes hinted that Dr. Parkhurst had "planned to compass the ruin of the police department" in revenge for the police refusing to give false evidence in a certain case, Dr. Parkhurst argued that Mr. Byrnes had, by his own evidence, proved himself either corrupt or too incompetent to be worthy of his place. "If the exigency arises again I shall put a detective on Mr. Byrnes," said Dr. Parkhurst. Such a man could not be downed. The great anti-Tammany victory of 1894 was largely the result of Dr. Parkhurst's work.

Dr. Parkhurst is also president of the City Vigilance League, an organization of young men for the purpose of arousing their civic knowledge and interest. It contributes largely to

Dr. Parkhurst's power. He was induced to effect this organization from his interest in young men, and his strong desire that they should realize civic rights as well as duties. The League makes use of thirty-five assembly districts. At the head of each is an assembly leader. These thirty-five leaders compose the administrative council of the League, and determine its general policy. Directly under the assembly leaders is one man from each of the 1300 election districts. By this means, a co-ordination of work and result is effected, and an organization is always in readiness to make effective the wishes of an enlightened public. Dr. Parkhurst continues his regular parish work, one of the best known, most respected men in New York city. A Republican in politics, he places reform always before party, and God before all. His book, *Our Fight with Tammany*, 1895, tells the story of this contest.

PARKS AND PLAYGROUNDS.—The question of parks and playgrounds in cities is of modern origin, growing out of the rapid growth and overcrowding of our cities. It was in 1851, when the population of New York City was just above the 500,000 mark, that the State legislature passed an act for the creation of a park in the city, which afterward was developed into the famous Central Park. In 1854 the city of Paris took steps to supply itself with parks, and only just a little before this there were three small park undertakings in England.

As late as 1870 Central Park was still uncompleted, although the city had then increased to over 900,000. It required a large degree of faith even then to see any decided advantage in sinking \$5,000,000 in a piece of land four miles away from the center of population, to reach which there was no steam transit, and from which, as was said at that time, "For practical, everyday purposes, the great mass of people might have been 100 miles away." It was not many years after the successful establishment of Central Park before there was scarcely a city of the world making any claims to prominence and progress that was not providing itself with these valuable possessions. The newer cities, learning wisdom from the experiences of the older, made ample provisions for parks in the laying out of the cities, and developed their park systems with the development of the cities.

Zoological and botanical gardens are also few in American cities. Central Park in New York, and Fairmount Park in Philadelphia, have zoological exhibits or menageries. There are beautiful botanical gardens at Washington and St. Louis. The new zoological park at the national capital will be one of the finest in the world. The best known in Europe are the famous "Zoo" at Regent's Park, London, and the *Jardin des Plantes* and the *Jardin d'Acclimatation* in Paris. At present a company has a charter to lay out a botanical garden in the city of New York.

What has been already accomplished in this country and in the leading cities of Europe can be seen in the following table:

CITIES.	Population, 1894.	Area of City.	PUBLIC PARKS.		PARKS, CITY AREA, AND POPULATION.						DEATH RATE PER 1000, 1893.	
			Number.	Area.	Average Area of Parks.	Per cent. of City Area in Parks.	Number of Population to Each Park.	Population to One Acre of Park.	Population per Acre of City.	All Ages.	Children Under Five.

a. Boston is establishing a circle of parks and promenades or drives, so that it really has many more than 8 parks, and these admirably located. (There are some 40 open places and squares in the city.) b. This does not include the Coney Island Concourse, 70 acres, and the Parade Ground, 40 acres, recently brought within the city limits; nor the Ocean Parkway, 5½ miles long, and the Eastern Parkway, 2½ miles long, each road being 210 feet wide. The area of the city given is the old area before the annexation. c. "Besides a number of places." d. "Including park approaches." e. "Cleveland has recently purchased six parcels of land in different sections of the city for parks, aggregating about 700 acres." f. The street-car company has a park of 166 acres near the city. Armstrong Park, 150 acres, lies near the city. g. "Several of these are very small, nothing more than small triangles. About 18 fair-sized parks." h. "Most of the parks of the city are very small." i. Pelham Park (1700 acres) and one-half of Bronx Park (653 acres) lie outside the city limits. Total area of parks belonging to the city, 5774 acres. j. "Thirteen small, three large." k. "Besides these there are Rock Creek Park, 1500 acres, and the Zoological Park, containing 16 acres." l. Of the 413.52 acres in the city, 341.83 are improved." m. "The area of Athens is too large for its population. Besides the two parks there are several squares." n. "The corporation also possesses two hills called Redual and Bilberry Hills, containing 82 acres, and situated 10 miles without the city." o. Death-rate per 1000 children under five, 77. p. "And several small open spaces." q. "Two hundred and forty-five thousand of the population reside on an area containing 64 persons to the acre." r. Death-rate per 1000 children under five, 76.5. s. "Includes Queen's Park and Arboretum, which are under Government control and contain about 614 and 53 acres respectively." t. "Includes Botanic Gardens, 2½ acres, and adjoining highlands of ½ acres, also 7 disused graveyards open to the public, with an area of 12 acres, and 11 minor open spaces, with an area of 11 acres." u. Death-rate per 1000 children under five, 64. v. "The area of the lakes within the parks is not included in the total area of park ground." w. Dr. Benkerman, Chief of Statistics of the State of Hamburg. x. "Several are very small, being disused churchyards, etc., laid out as ornamental grounds. Largest public park, 382 acres." y. "Nine hundred and sixteen thousand, five hundred in the city and the rest in the suburbs." z. "Of which 1127.26 acres contain houses and 1258.11 acres are water." aa. "The two great parks, of 272 and 54 acres respectively, are situated outside the area of buildings. Inside, the six largest contain, respectively, 29, 25, 22, 9½, 6½, and 5¾ acres." ab. Death-rate per 1000 children under one year, 170.16; per 1000 children from one to five, 37.93.

Philadelphia has the largest single park in the United States, containing 2648 acres, extending for some 12 miles on either side of the Schuylkill river, and beautifully laid out in walks and drives. Next to

the famous royal Epping Forest, near London, it is the largest in the world.

The following shows the superficial area of some of the principal parks of the world:

	<i>Acres.</i>

Belle Isle, Detroit.....	700
Eden Park, Cincinnati.....	209
Franklin Park, Boston.....	467
The Common, Boston.....	50
Public Garden, Boston.....	24

Concerning the need of small parks and playgrounds, we quote from various sources :

The city of London has now some 5000 acres in parks, but Octavia Hill, who has done so much for the elevation of the poor of that city, found upon investigation that the city of London had been neglecting those who were most in need of these open spaces. Writing in *The Nineteenth Century* for February, 1888, she describes what she found in the heart of London—included within a circle, 8 miles in diameter, having an area of about 50 square miles and a population of 2,828,585, there were 1701 acres of park for the western half and but 223 acres for the eastern half. In the eastern half were 1,668,412 people, crowded at a rate of 101 to the acre, and having one acre of park to but 7481 of population; while in the western half is a population of only 1,160,173, or 72 to the acre, and with one acre of park to every 682 of population. The western half was thus nearly eleven times better off for park room, in proportion to the population, than the eastern half.

Urging upon her readers the necessity of providing more park room, and giving her reasons why she spoke out so earnestly, Miss Hill said :

"It is one thing to know theoretically and scientifically that they are needed, and it is another to live, as it were, side by side with those who need them; to realize, in regard to this man and that woman, how far their home is from any summer outdoor sitting-room, from any refreshing lane or field for Saturday afternoon walk; to know little children who can never, from year's end to year's end, be taken by their mother to the nearest park; to see the little pale face and shriveled form of an invalid child who cannot be laid down on the grass in the sunlight to be healed and cheered, but must sit the whole summer day through in the hot room in court or alley; to watch the big lads who get into mischief because they have no scope

for their energies, no space for game at hare and hounds, no opportunity for leaping ditches, or climbing hills, or skating, or taking a fresh walk; to watch the fresh air diminished in one neighborhood after another, taller houses being built and more of them, yard and garden more and more built over year by year, forecourts covered and the country retreating, as it were, further and further from within walking distance of one and another of my working friends. This is different from reason and science; this is life and this is pain. This urges me to speak; making it my duty to speak, and that before it is too late."

For what has been done, see LONDON COUNTY COUNCIL. Concerning New York City, *The Voice* of June 28, 1894, says :

"Of the 50 parks owned by the city and containing about 5000 acres, Pelham Bay Park, with its 1756 acres, lies entirely without the city limits, and more than 300 acres of Bronx Park lies on the east side of the Bronx River, and so outside the city limits.

"The most noticeable fact is the great disparity between the upper and lower parts of the city, in the number and extent of parks. The Harlem River divides the city into two nearly equal parts, but the part of the city above the Harlem has nearly twice as much park space, with less than one-twentieth the population. There are other marked differences on Manhattan Island itself. Fortieth Street divides the island into two sections, of which the lower part has less than one-half the area of the upper, but above 200,000 more population. There are six more parks in number in the section below Fortieth Street, but the total area of parks below Fortieth Street is but 61 acres, while the upper end of the island has Central Park, Riverside Park, and a number of other large ones, aggregating 1049 acres.

"Much of the section below Fourteenth Street is in a far worse condition than between Fourteenth and Fortieth streets. The annexed table shows the condition of the six most densely populated wards, which form a compact area of about 1½ square miles on the east side of the city, and, with the exception of the Fourteenth Ward, on the east side of the Bowery. In this section there are, all told, but four parks and open spaces, three of which are mere triangles, the largest measuring less than a half-acre. The Tenth Ward, with its 622 persons to the acre, the most densely crowded spot in America, and probably in the world, has not even a breathing-hole, not even the inner spaces of the blocks offering any relief; for within the 48 blocks of the ward there are 158 rear houses, giving shelter to over 5800 people, nearly 1000 of whom are under five years of age. Other wards without a park or breathing-hole are the Thirteenth, with its 515 of population to the acre; the Eleventh, with 454 to the acre; the Fourteenth, with 342 to the acre; the Eighth, Fourth, Third, and Second, all below Fourteenth Street, and the Sixteenth, on the west side, just above Fourteenth Street.

DISTRIBUTION OF PARKS IN NEW YORK CITY—SIX MOST CROWDED WARDS.

NEW YORK CITY.	Population, 1893.	Area in Acres.	Density of Population per Acre.	Number of Parks.	Area of Parks in Acres.	Population to One Park.	Population to One Acre of Park.	Per cent. of Total Area in Parks.

"Of the 50 parks belonging to the city there are 4 of more than 600 acres each, 2 more than 50 acres, 6 between 50 and 20 acres, and 9 between 20 and 5 acres, and 5 more above 1 acre. Twenty-four of the 50 parks and spaces, or nearly one-half, are less than 1 acre each in area, while 21 are under one-half acre, and 9 less than one-tenth of an acre."

Concerning the creation and need of small parks Mr. Alfred R. Conkling says (*City Government in the United States*, pp. 55-59):

"In 1884 an act was passed by the New York legislature to create new public parks. It was argued that this was the time to acquire land for park purposes, lest it should become too valuable if further delay were made. It was enacted that several new parks should be established, but the nearest proposed site was about seven miles from the densely populated district of Manhattan Island. Since the passage of the law about \$10,000,000 have been expended in buying parks at the upper end of the city of New York.

"In 1887, at the suggestion of Mayor Hewitt, an act creating small parks in the city of New York was passed. It was soon decided to take the block known as Mulberry Bend for park purposes—a block about 200 by 600 feet, containing a little less than three acres. Proceedings were begun, and it is only now (July 1, 1894) that the title to the Mulberry Park block has been vested in the city. In other words, it has taken seven years to select and acquire title to a site for a small park in New York, not to speak of the time required for razing the buildings and laying out the grounds.

"I dwell upon the experience of the city of New York as a forerunner of what has been done and what will be done in American cities for public parks.

"The plan of laying out small parks in the tenement-house district should be supplemented by small public playgrounds for children. It has been suggested that a lot about 50 by 100 feet should be bought adjoining all public schoolhouses. This lot should become a sort of public-school park, with an entrance from the street. It could be used by the school children during recess, and by the children of the neighborhood at all other times. Light athletic games should be encouraged, such as tennis, handball, swings, and seesaws. A gymnastic apparatus might be added, and a tent could be erected on hot days in summer.

"It may be said of these public playgrounds in the densely populated districts that the noise and shouting of the youngsters would become a nuisance. But that matter would soon adjust itself, for the noise would be confined only to the daytime, or it would certainly cease early in the evening. The janitor of the schoolhouse could attend to the public park without additional compensation.

"In 1892 it was suggested to establish a children's playground in the southwest corner of Central Park. The commissioners reported that the expense would be about \$100,000, and, after thorough discussion in the public press, they decided to abandon the plan. It should be said that a portion of Central Park is made a public common on Sundays and holidays—that is, the public has the right to roam over the grass on those days.

"An American in Europe notices at once the difference between the management of the public parks in the New and the Old World. In the United States there is generally a park police, and the parks are strictly managed. For instance, citizens are not allowed to fall asleep on the benches in the parks. The traveler in Paris and London sees that much more freedom is allowed in those cities.

"The experience of Paris is worthy of careful study. The Emperor Napoleon III. improved the densely populated districts, and where miserable and vile dwellings were inhabited by the most destitute class of citizens, he ordered these dwellings to be removed and laid out beautiful parks, planted with flowers, shrubs, and trees. He created many breathing-places well supplied with benches for the accommodation of the public. He also made the point that, where a dense and excitable population was demanding work and inclined to riots, it was wise to give them employment, provided the work was necessary and was warranted by the financial condition of the municipality. Napoleon I. erected arches in certain squares.

In Europe.

"Paris is now the pleasure city of the world, and foreigners from all countries, especially from South America, make their home there. The

permanent leisure population of foreign birth in Paris is probably larger than in any other city. This feature of Paris is owing to the policy of Napoleon III., and largely to the number of public parks and parkways.

"Skillful architects should be employed to lay out public parks, and their management should not be entrusted to the ordinary ward politician, who is inclined to enrich himself, or to propose improvements for the purpose of helping some contractor who belongs to his political organization. A small public park can often be established at slight expense by using a V-shaped lot, formed by the intersection of a diagonal avenue with a longitudinal street. There are a few such parks in the city of New York, although they were closed to the public until 1887. Eleven such parks had been locked, when Mayor Hewitt suggested that they be opened. Short paths were laid out within these parks; flowers and shrubs were planted, and benches placed inside them. The observer may see the children from the tenement-houses now using these parks with great advantage.

"In American cities music is provided at public expense on Saturdays, and in some cities on Sundays. In Europe the bands of the standing army, which are, of course, paid for by taxation, perform in the public parks very frequently."

Professor E. R. L. Gould, on this last point says, in an article in vol. i. of the publication of the American Statistical Association (1888):

"Large cities should follow the advice of Professor Jevons, build pavilions for winter use in one or two of the principal parks, and maintain all the year around orchestras and bands of music, with other light attractions, to provide entertainments, either wholly free to the public or at a merely nominal rate of admission. There should be at least one Crystal Palace in every great city. During the summer months, concerts should be given as often as every other week-day evening in every one of the large and moderately sized spaces."

PARLIAMENT (from old French *parlement*, a speaking), a name given to deliberative assemblies, especially to the legislatures of Great Britain and her self-governing colonies. The origin of Parliament in Great Britain is obscure, save that there is no doubt that alike in Saxon and Norman times the English people had some share in making the laws whereby they were governed. The *Magna Charta* of 1215 recalled some of those forgotten rights, but the first Parliament of which any record is preserved was called in 1265 by a writ of Henry III., summoning the knights, citizens, and burgesses to meet in Parliament. Down through the fifteenth century all these classes met together in one house. To-day Parliament consists of monarch, lords, and commons. The three estates of the realm are lords spiritual, lords temporal, and commons. In 1894 the House of Lords consisted of 2 archbishops, 24 bishops, 6 peers of the blood royal, 22 dukes, 22 marquises, 120 earls, 26 viscounts, 310 barons, 16 Scotch and 28 Irish representative peers. The last consecrated of the 25 English diocesan prelates,—provided he holds an inferior see,—the suffragan and coadjutor bishops have no seat. The number of the higher lords is growing less, but the numbers of barons is increasing, the creation of peerages being vested in the Crown. All peerages are hereditary. The Scotch and Irish representative peers are elected by the Scotch and Irish peerage.

The House of Commons has 670 members, as follows:

	England and Wales.	Scotland.	Ireland.
Members for counties.....	253	39	85
Members for boroughs.....	237	31	16
Members for Universities.....	5	2	2

Minors, outlaws, lunatics, aliens, common-law judges, clergy of the Church of England, Roman Catholic priests, pensioners for a term of years, contractors with government, members of the India council, and peers are disqualified. By the act of 1858 property qualification was abolished. A member cannot resign his seat. The House of Lords has judicial and legislative powers, the latter with the Crown and the House of Commons.

The House of Commons imposes taxes and raises money. At present members are elected for seven years. Parliament assembles on the summons of the sovereign, and must be assembled at least once in three years. Practically it is called every year. It commences with a speech from the throne. No member can be questioned outside of Parliament for what he has said within it, and is free from arrest in civil causes, but may be adjudged bankrupt, and his goods taken. Every bill must be read three times before each house, and also be reviewed clause by clause by Select Committee, or by the whole House as a Committee.

PARSONS, ALBERT R. See CHICAGO ANARCHISTS; end of article.

PATENT LAWS.—A patent is the grant by government to the author of an invention, or to his heirs, of the exclusive right to use or sell the invention for a fixed number of years. It is also used—although this is an older meaning and is passing out of use—of the instrument or letters by which a grant of land is made by a government to a person or corporation.

Art. I. sec. viii. clause 8, of the Constitution gives Congress right

"To promote the progress of science and useful arts, by securing for limited times, to authors and inventors, the exclusive right to their respective writings and discoveries."

Provision was made by Congress, in 1790, for giving to inventors the exclusive right to their discoveries. From that time to the present patents have been issued, the number increasing each year. At first, applications for patents were made to the Secretary of State, and the decision was made by a board, consisting of the Secretary of State, the Secretary of War, and the Attorney-general. In 1793 the Secretary of State alone was authorized to issue patents. In 1836, an office, or bureau, was created in the Department of State under the name of the Patent Office, the chief officer being styled the Commissioner of Patents. From that time patents have been issued by the Commissioner. The Patent Office was transferred to the Department of the Interior in 1849, when this latter department was created. Originally patents were issued by the President of the United States; then by the Secretary of State and the Commissioner of Patents; now by the Secretary of the Interior and the Commissioner.

The term for which a patent was valid was fourteen years originally, but in 1870 it was made seventeen years. It is competent for Congress to extend the time of a patent, whether application be made before or after the expiration of the original term. In 1836 the power to extend for seven years, if the patentee had failed to receive a suitable return for his time, ingenuity, and expense, was conferred on a board, consisting of the Secretary of State, the Commissioner of Patents, and the Solicitor of the Treasury. But such extension must be granted before the expiration of the time for which the patent was originally issued. Since 1848 the power to extend in such cases has been exercised by the Commissioner.

In 1836 the Patent Office was burned and many of the records destroyed. Congress embraced the opportunity to thoroughly revise the whole system. By an act passed in that year prior acts were substantially repealed and the present system substituted.

As at present organized, the Patent Office is attached to the department of the Secretary of the Interior. It consists of the following officers: One commissioner, one assistant commissioner, and three examiners-in-chief, all appointed by the President, by and with the advice and consent of the Senate. All other officers, clerks, and employees are appointed by the Secretary of the Interior on the nomination of the Commissioner of Patents.

Among the peculiarities of the patent laws of the United States it may be mentioned that the term for which they are granted, seventeen years, is longer than in any other country. The development of the patent system in the United States far exceeds that of any other nation. For several years the number of patents issued in the United States has been nearly equal to the

History.

number issued by all other civilized nations together. A pamphlet containing the *Patent Laws and Laws relating to the Registration of Trade-marks and Labels*, and one containing the *Rules of Practice in the United States Patent Office*, are published by the office, and can be obtained, free of charge, by any one desiring them, on application by mail to the Commissioner of Patents. It is, however, practically impossible for an inventor himself to prepare the papers, drawings, etc., necessary to obtain a patent, with the requisite degree of scientific and technical skill. "Patent lawyers" form a distinct branch of the profession, and the inventor will find it in the end the cheapest as well as the surest course to intrust his case to an attorney who makes the practise of patent law a specialty.

Patents may be granted for *designs* and *trade-marks*, as well as for machines. Designs may be patented for three years and six months, for seven years, or for fourteen years; and trade-marks may be patented for thirty years.

The applicant for a patent must make oath that he believes himself to be the original inventor of that for which he seeks a patent; he must file a full description of the same, and, in all cases admitting it, must present drawings and a model. A prior patent in a foreign country does not debar him from receiving a patent here, provided the invention shall not have been introduced into public use in the United States for more than two years prior to the application.

If one has made a discovery or invention, but wishes to mature it, he may file a *caveat*, setting forth its character, and praying for protection of his right until he can mature the invention. Should another apply within a year for a patent covering the same ground, notice is given to the first applicant, who must file his description, etc., within three months.

Patents are issued in the name of the United States, and under the seal of the Patent Office, to any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned; and by any person who, by his own industry, genius, efforts, and expense has invented and produced any new and original design for a manufacture, bust, statue, alto-relievo, or bas-relief; any new and original design for the printing of woolen, silk, cotton, or other fabrics; any new and original impression, ornament, patent, print, or picture to be printed, painted, cast, or otherwise placed on or worked into any article

of manufacture; and any new, useful, and original shape or configuration of any article of manufacture, the same not having been known nor used by others before his invention or production thereof, nor patented nor described in any printed publication, upon payment of the fees required by law and other due proceedings had.

Every patent contains a grant to the patentee, his heirs or assigns, for the term of seventeen years, of the exclusive right to make, use, and vend the invention or discovery throughout the United States and the Territories, referring to the specification for the particulars thereof.

If it appears that the inventor, at the time of making his application, believed himself to be the first inventor or discoverer, a patent will not be refused on account of the invention or discovery, or any part thereof, having been known or used in any foreign country before his invention or discovery thereof, if it had not been before patented or described in any printed publication.

Joint inventors are entitled to a joint patent; neither can claim one separately. Independent inventors of distinct and independent improvements in the same machine cannot obtain a joint patent for their separate inventions; nor does the fact that one furnishes the capital and another makes the invention entitle them to make application as joint inventors; but in such case they may become joint patentees.

The receipt of letters patent from a foreign government will not prevent the inventor from obtaining a patent in the United States, unless the invention shall have been introduced into public use in the United States more than two years prior to the application. But every patent granted for an invention which has been previously patented by the same inventor in a foreign country will be so limited as to expire at the same time with the foreign patent, or, if there be more than one, at the same time with the one having the shortest unexpired term; but in no case will it be in force more than seventeen years.

Fees must be paid in advance, and are as follows: On filing each original application for a patent, \$15; on issuing each original patent, \$20. In design cases: For three years and six months, \$10; for seven years, \$15; for fourteen years, \$30. On filing each caveat, \$10. On every application for the reissue of a patent, \$30. On filing each disclaimer, \$10. For certified copies of patents and other papers in manuscript, 10 cents per hundred words; for certified copies of printed patents, 85 cents. For recording every assignment, agreement, power of attorney, or other paper, of three hundred words or under, \$1; of over three hundred and under one thousand words, \$2; of over one thousand words, \$3. For copies of drawings, the reasonable cost of making them.

The receipts of the Patent Office during the fiscal year 1892-93 were \$1,288,809.13, and expenditures, \$1,139,713.35. Receipts over expenditures, \$154,593.

The following is a statement of the business of the Office for the fiscal year ending June 30, 1893:

Number of applications for patents.....	39,539
Number of applications for design patents.....	1,201
Number of applications for reissue patents.....	111
Number of applications for registration of trade-marks.....	2,282
Number of applications for registration of labels.....	454
Number of caveats filed.....	2,349
Total.....	45,936
Number of patents granted, including reissues and designs.....	23,471
Number of trade-marks registered.....	1,384
Number of labels registered.....	None
Number of prints registered.....	1
Total.....	25,356
Number of patents withheld for non-payment of final fees.....	3,679
Number of patents expired.....	13,672

The total number of applications filed at the Patent Office in fifty-seven years, 1837-93, was 872,995; number of caveats filed, 98,248; number of patents issued, 500,543. Receipts, \$29,209,915.13; expenditures, \$23,753,460.35; net surplus, \$5,456,454.78.

In England the patent system is not dissimilar, but has been much debated. The Crown seems always to have enjoyed the prerogative right to grant monopolies, and this had been so greatly perverted in the time

of Elizabeth that the popular clamor led to a statute in the following reign having for its object to prevent the Crown in future making any grants of that kind which should be prejudicial to the interests of trade. By that act an exception was expressly made in favor of new inventions. At first the judges construed grants of monopoly to inventors very strictly; but afterward it was seen that they were for the benefit of trade, and were dealt with more liberally. An important modification of the law was introduced by a statute of Queen Anne, which required every inventor to describe in detail the nature of the invention in an instrument called a specification. Another statute of 5 and 6 Will. IV., c. 83, further altered the law by allowing parties who had a difficulty in separating what was new from what was old in their invention to enter an express disclaimer of that part which was not new. But the most important alteration was made by the statute of 15 and 16 Vic., c. 82, 1852.

In 1862 a royal commission was appointed to consider the whole subject of the patent laws, and to suggest alterations which might be useful. The commission collected evidence in that and the two following years, and made its report in 1864. Other commissions and committees have made later inquiries, and offered suggestions founded on the evidence collected; but the opinions expressed, on almost every point, are most conflicting. The divided opinion of practical men has hitherto discouraged any attempt to legislate on their recommendations; and the act of 1852 remains still in force.

That some mode of rewarding the individual whose perseverance and ingenuity have enabled him to discover a new invention should be established is universally admitted, but whether it should be at the expense of that part of the public who are purchasers, and therefore benefited by his discovery, or by the public at large in the shape of a pension, is a matter still undecided. The evils of the present law are that there is a great deal of uncertainty in the mode of ascertaining what is a new invention. Hence, when a patent has been granted, if it is of such a nature as to lead to competition, infringements are almost matters of course, and the only mode of discovering and checking the infringement is so tedious, costly, and ineffective that inventors generally pass their lives in constant litigation, fighting in detail a succession of imitators who often have nothing to lose by defeat, and therefore entail all the greater burden on the legitimate manufacturer. It has been said that not more than three patents per cent. are remunerative.

France.—Grants of patents (*brevets d'invention*) are regulated in France by the law of 5th July, 1844. Patents are granted to inventors or their assignees, whether natives or foreigners, and the French patent expires with any foreign patent of earlier date. Applications for French patents must be made prior to the filing of the complete specification in any foreign country. Patents are granted for a term of fifteen years upon payment of an annual duty of \$20.

Germany.—By a law dated 25th May, 1877, patents are granted for fifteen years to natives and foreigners. The invention must not have been previously described in a printed publication in any way. The patentee may obtain supplementary patents for improvements expiring with the original patent. A Government duty of \$7.30, is paid on the issue of the patent, together with an annuity.

The Governments of Belgium, Brazil, France, Guatemala, Holland, Italy, Portugal, San Salvador, Servia, Spain, Switzerland, and Great Britain have signed an international convention relating to patents, the salient points of which are: (1) That the subjects of each of the above States shall, in all the other States, as regards patents, enjoy the advantages that their respective laws grant to their own subjects; (2) that any person who has duly registered an application for a patent in any one of the States shall enjoy a right of priority protecting the first patentee against any acts accomplished in the interval for a term of six months—a month longer being allowed for countries beyond the sea; (3) that the introduction by the patentee, into the country where the patent has been granted, of objects manufactured in any of the other States shall not entail forfeiture, but the patentee remains bound to work his patent in conformity with the laws of the country into which he introduces the patented objects; (4) that the States agree to grant temporary protection to patentable inventions for arti-

Abroad.

International Patents.

cles appearing at officially recognized international exhibitions.

Concerning the general question of patent laws much is to be said on both sides. Mr. C. W. Baker says, in his *Monopolies and the People* (p. 89):

"If we judge the granting of patents by the aims and intentions which are held in the theory of the law, we must conclude that it is a highly wise, just, and beneficial act. The man who invents a new machine or device which benefits the public, by making easier or cheaper some industrial operation, performs a valuable service to the world. But he can receive no reward for this service, if any one is at liberty

Discussion of the System.

to make and sell the new machine he has invented; and unless the patent laws gave him the power to repay himself for the labor and expense of planning and designing his new device, it is altogether probable that he would not spend his time in inventing.

"The wealth which a valuable patent promises has been a great incentive to the work of inventors, and has undoubtedly been a chief cause of the great mechanical advancement of the last half century. But the state of mechanical science has greatly changed from what it was when the clause of the Constitution was penned which speaks of inventions as 'discoveries.' The trained mechanical designer now perfects a machine to do a given work, with almost the same certainty that it will be successful in its operation that he would feel if the machine were an old and familiar one. The successful inventor is no longer an alchemist groping in the dark. His task is simply to accomplish certain results with certain known means at his disposal, and certain well-understood scientific principles to guide him in his work. But this statement, too, must be qualified. There are still inventions made which are the result of a happy inspiration as well as of direct design. Not all the principles of mechanical science and the modes of reaching desired ends are yet known or appreciated by even the best mechanical engineers. There is still room for inventors, whose rights should be protected. The interpreters of our patent laws have always held the theory that the use of a natural agent or principle could not be the subject of a patent. This is undoubtedly wise and just. The distinction should always be sharply drawn between those existing forces of nature which are as truly common property as air and sunlight, and the tool or device invented to aid in their use.

"Again, it is a notorious fact that the great multiplicity of inventions has made the search to determine the novelty of any article submitted for a patent for the most part a farce. No one is competent nowadays to say surely of any ordinary mechanical device that it is absolutely new. The bulky volumes of Patent Office reports are for the most part a hodge-podge of crude ideas, repeated over and over again under different names, with just enough valuable matter, in the shape of the inventions of practical mechanical designers and educated inventors, to save the volume from being an entire waste of paper and ink. Space, however, will not permit us to discuss at length the faults of our patent system. The important point for us to notice is that the patent system establishes certain monopolies, and that these monopolies are not always harmless. Patents are given to 'promote the useful arts,' but the inventor whom they are supposed to encourage reaps but a small share of the profits of his inventions. Valuable improvements soon fall into the hands of large companies, who are able to defend them in the courts and reap all possible profits by their use.

"Again, patents sometimes aid in the formation of trusts and combinations. Two or three firms may control all the valuable patents in connection with some important industry. If they agree to combine their interests and work in harmony, they are far stronger than an ordinary trust, because the patents they hold prevent outside competition. It was pointed out in the opening chapter how the control of patents was sometimes a feature helping to induce the formation of trusts. The Standard Oil Trust had its origin in the superiority which one firm gained over its competitors through the control of an important patent. The envelope trust, which, at this date, has raised the price of envelopes about 20 per cent., owes its chief strength to its control of patents on the machines for making the envelopes. Instances innumerable

could be given where a few manufacturers, who by their ownership of patents controlled the whole field, have ended a fierce competition by consolidating or agreeing to work together harmoniously in the matter of selling-prices. Very many of these are monopolies in trade or monopolies in manufacturing, and, as such, have already been considered in the preceding chapters; but it is proper here to point out the part which our patent system has taken in their formation, and the fact that it is to their control of patents that many of the existing combinations owe their security against outside competition.

"Probably the public was never so forcibly reminded of the defects of our patent system by any other means as it has been by the operation of the Bell Telephone monopoly. The purpose in granting patents is to aid in the establishment of new lines of industrial activity, secure to the inventor the right to reap a reward for his work, and encourage other inventors to persevere in their search for new improvements. All these things are effected by the monopoly which is held by the Bell Telephone Company; but they are effected at a cost to the users of the telephone under which they have grown very restive. Passing by the statement that the patents which the Bell company holds were illegally procured in the first place, through the inventor having had access to the secret records in the Patent Office of other inventions for which a patent had been asked at about the same time as his own, it is an undisputed fact that the Bell company holds the monopoly of communication by electric telephone in this country. They have managed this monopoly with great skill. While the instrument was yet in its introductory stage, and when every smart town felt obliged to start a telephone exchange or fall behind the times, prices were kept low; but when once the telephone became a business necessity, and its benefits were well known, rates of rental were advanced to the point where the greatest possible profits would accrue to the Bell company's stockholders. This was excellent generalship. The same principle is applied in many other lines of business; and it was only because the company held a monopoly of a most valuable industry that it proved so immensely profitable here. But other acts of the company, it is alleged, while within the letter of the law, are yet clearly infringements on the just rights of the public. It is charged that the company has purposely refrained from putting into practical use any of the many improvements which have been made in the telephone during the past few years, but at the same time has quietly secured their control. By skilfully managing 'interferences' of one patent against another, and by amending and altering the various specifications, it contrives to delay as long as possible the issue of the patents upon these inventions."

Socialists and extreme individualists have almost invariably opposed patent laws. Individualists would have every one depend in free competition upon his own wits, with little or no defense from governments. Socialists would have every invention used for the good of all, inventors being rewarded not by being given a monopoly of their inventions but by material or other honorary reward. Patents, they argue, to-day do not usually reward the real inventor, but some rich corporation or individuals, who can afford to buy up the patent and push it for their advantage, or more likely put it upon the shelf, to prevent its competing with their present processes. Patents therefore, they claim, rarely aid the real inventor and usually defraud the public of the advantage of inventions. The only inventors who are aided are, usually, very wealthy ones who need it least. Poor inventors rarely have the capital to set their invention in use and therefore have to sell it, at terms which, after paying the fees and going through the tedious process of securing a patent, leave them usually more poorly off than if there were no patent laws.

References: Among the best works on patents in this country is that of George Ticknor Curtis; Phillips

and Fessenden are also standard authors. The best English work is that of Agnew. (See also PATENT REPORTS, etc.) (See also article COPYRIGHT.)

PATRONS OF HUSBANDRY. See GRANGE, THE.

PATTEN, SIMON NELSON, was born at Sandwich, Ill., in 1852. He studied at Evanston, Ill., and Halle, Germany, and received the degree of Ph. D. at Halle in 1878. He was principal of public schools in Illinois and Iowa for several years, and was elected Professor of Political Economy in the Wharton School of Finance and Economy of the University of Pennsylvania in 1888.

Professor Patten holds, with the historical school in which he was educated, to the importance of the study of facts, but would make a large use of deductive reasoning. He considers progress possible only when the deductive and historical methods of research are properly combined.

He believes a protective policy the necessary outcome of the industrial conditions of this country, and that these conditions will not allow of any radical change of industrial policy in the immediate future.

He believes that a gold standard is not only desirable, but is also at the present time an industrial necessity. The use of silver, he thinks, should be restricted as carefully as that of paper money.

He considers that the evils due to natural monopolies are of so recent an origin that it is not yet possible to determine what policy is the best to control them, and has therefore no decided opinions on this subject.

His main writings are: *Premises of Political Economy* (1885); *The Stability of Prices* (1888); *The Consumption of Wealth* (1889); *The Principles of Taxation* (1889); *The Economic Basis of Protection* (1890); *The Decay of State and Local Governments* (1890); *Another View of the Ethics of Land Tenure* (1890); *Educational Value of Political Economy* (1890); *The Theory of Dynamic Economics* (1892); *The Interpretation of Ricardo* (1893); *The Scope of Political Economy* (1893).

PAUPERISM is the condition of the destitute who are more or less dependent upon the community for support.

For the causes of pauperism, see POVERTY, CAUSES OF; for the relief of pauperism, see ALMSHOUSES; CHARITY ORGANIZATIONS; DEPENDENT CHILDREN; UNEMPLOYMENT; POOR LAWS; SOCIALISM, etc.

In this article we consider simply the

STATISTICS OF PAUPERISM.

In the United States there are no official statistics of pauperism, save for the indoor paupers, or inmates of almshouses (*q. v.*), but these form but a small proportion of the whole number. Mr. Charles D. Kellogg, the secretary of the New York Charity Organization Society, and Professor R. T. Ely, both estimate the total number of paupers in the United States in 1890 at 3,000,000. Says Pro-

fessor Ely (*North American Review*, April, 1891):

"While we may deplore the lack of careful statistical information concerning pauperism in this and other countries, there are certain facts which we do know. First of all is this fact: there exists in the United States an immense mass of pauperism. No one knows either how great this mass is, or whether it is relatively, or even absolutely, larger than in former times. Several States in the Union, as New York, Massachusetts, Pennsylvania, and Ohio, publish statistics concerning the defective, delinquent, and dependent classes, but many of the States gather no statistics at all, or very inadequate ones. Such statistics as we have cannot well be brought together and compared, because they have not been collected in the same year in different States, nor have they been collected according to similar methods. The word pauper in one State means one thing, and in another State something else. For example, dependent children are in one place classed among the paupers, and in another place they are put in a category by themselves.

"The only authority competent to gather the facts which we ought to know for the whole country is the Federal Government, and it has attempted to do something in the various censuses. The census reports, however, have been heretofore incomplete and unsatisfactory, and during last year the praiseworthy attempt to gather most important social information has been at least partially frustrated by the senseless opposition of the newspapers. Mr. Frederick H. Wines, a high authority, was the special agent of the Tenth Census appointed to gather the statistics concerning the submerged tenth, and he reported altogether about half a million. This, however, is an underestimate. Only a little over 21,000 outdoor paupers were reported, whereas a single city undoubtedly has a larger number receiving public relief outside of public institutions. It is admitted in the report that the attempt to secure anything like a complete or adequate enumeration of them in the present census was a failure. 'The present census' means the census of 1880.

"At the sixteenth Conference of Charities and Correction, in Omaha, in 1889, the committee on reports from States expressed the opinion that it was safe to estimate the number of persons in the United States receiving outdoor relief at an average of 250,000 during the year, including at least 600,000 different persons. This same committee, including Messrs. F. B. Sanborn and H. H. Hart, did not regard 110,000 persons as an overestimate of the population of the almshouses of the country. Five States of the Union alone report nearly half that number. These are New York, with 19,500 inmates of almshouses; Pennsylvania, with 13,500; Massachusetts, with 9000; Ohio, with 8000; and Illinois, with 5000. These States, however, do not include much over one-third of the population of the country. Mr. Charles D. Kellogg, the able and devoted secretary of the New York Charity Organization Society,

Number of Paupers.

has estimated that three millions of people in the United States were wholly or partially supported by alms during a recent year, and that the support received by this number was equal to the total support of half a million paupers during the entire year. This estimate is based upon such facts as he had been able to gather, and even a guess from one situated as he is has some weight.

"Reliable statistics make this estimate of 3,000,000 for the United States not at all improbable. Three millions of paupers would comprise less than 5 per cent. of the population, or 1 in 20, whereas in Cologne, in Germany, in 1781, 1 in 4 of the population was a pauper. In England, in 1863, 5½ per cent. of the population consisted of paupers. Turning to the United States, we find that over 10 per cent. of the people of Buffalo, N. Y., received alms in 1876. The Buffalo estimate includes merely the recipients of city alms, and there must have been a large additional number of recipients of private alms. There are always many recipients of private and secret alms in every community, and this unknown number must be added to the number of known paupers if we are to have a correct view of pauperism in the United States. All that we can do is to say from the facts which come under our individual observation that the total number of those who receive private and secret charitable aid must be very large. Every careful observer with an extensive acquaintance knows many persons in

every social class either wholly or partially supported by private charity. They are persons who truly belong to the dependent classes, unable to maintain themselves in the world of competition, but who never figure in reports of any society or public charitable institution.

"There are many ways of arriving at this estimate of 3,000,000 in the United States. We may first, in order to be careful not to overestimate the pauperism of the United States, suppose our population to be 60,000,000, instead of sixty-two and a quarter millions, as it really is. We may next divide the percentage of pauper population of Buffalo by one-half, giving us 5 per cent. If it be granted that this is a conservative estimate, we will have still 3,000,000 of paupers. An experienced worker among the dependent and delinquent classes in New York estimated five years ago that there were 220,000 alms-receivers in that city. Critics who question the reliability of the figures wish to cut them down one-half, but even that would have left nearly 10 per cent. of the population, giving New York twice its proper share, if the estimate of 3,000,000 for the country be correct. *The State Charities Record*, the organ of the State Charities Aid Association of New York, states that during the year ending October, 1888, nearly half a million people in the State of New York received public aid, which would give us at the same ratio for the entire country over 5,000,000, as New York contains less than one-tenth of the population. This New York estimate, however, does not include the inmates of jails, workhouses, etc., and those who receive charitable aid from other sources. It is stated that, if these were added, we should have at least three-quarters of a million in New York State dependent upon charity, showing that for the State of New York General Booth's expression, the 'submerged tenth,' is far from being an exaggeration.

"The number of paupers varies greatly from year to year, according to the general prosperity of the country and other causes, and even within the same year, according to the season. The estimate of 3,000,000 cannot be regarded as an extravagant one for the United States during hard times. We have, then, that number of persons who at some time or another are compelled to ask support which they will not or cannot obtain for themselves. If we should cut down this number to half a million, it would be sufficient to cause distress to every lover of his kind, and to justify inquiry into the nature of pauperism, its causes and its cure.

"Numerous estimates have been made of the direct and indirect cost of pauperism to this country. The direct pauper expenditures of the United States may be placed at twenty-five millions of dollars at least; indeed, this must be an underestimate, for New York State alone expends for charitable purposes through its various institutions over thirteen millions of

dollars. If we place the average number of persons in the country supported by charity at 500,000, and estimate the loss of productive power for each one of these at \$500 per year, we shall have an indirect loss of fifty millions of dollars to be added to the direct expenditures. One hundred millions of dollars a year must be regarded as a conservative estimate of the total direct and indirect pecuniary loss to the country on account of pauperism."

One of the reasons why there is so much uncertainty and often such discrepancies as to the amount of pauperism is that the word is used in such various ways. It is used in several different senses, with the result of greatly confusing statistics.

Concerning the indoor paupers or inmates of asylums, the Eleventh Census gives the following tables :

PAUPERS IN ALMHOUSES IN THE UNITED STATES IN 1890, CLASSED BY SEX AND BY ELEMENTS OF THE POPULATION.

ELEMENTS.	Aggregate.	Men.	Women.
The United States.....	73,045	40,741	32,304
White.....	66,578	37,387	29,191
Native.....	36,656	19,375	17,281
Both parents native.....	21,519	11,123	10,396
One parent foreign.....	949	538	411
Both parents foreign.....	3,580	2,176	1,404
One or both parents unknown.....	10,608	5,538	5,070
Foreign born.....	27,648	16,938	10,710
Birthplace unknown.....	2,274	1,074	1,200
Colored.....	6,467	3,354	3,113
Negroes.....	6,418	3,326	3,092
Chinese.....	13	12	1
Indians.....	36	16	20

NATIVITY.

ELEMENTS OF THE POPULATION.	PAUPERS.			PARENTS OF			NATIVITY OF PARENTS.		
	Total.	Men.	Women.	Total.	Men.	Women.	Native.	Foreign born.	Unknown.
Total.....	66,578	37,387	29,191	133,156	74,774	58,382	45,215	63,587	24,354
Native, both parents native.....	21,519	11,123	10,396	43,038	22,246	20,792	43,038
Native, one parent foreign.....	949	538	411	1,808	1,076	822	949	949
Native, both parents foreign.....	3,580	2,176	1,404	7,160	4,352	2,808	7,160
Native, one or both parents unknown.....	10,608	5,538	5,070	21,216	11,076	10,140	1,228	182	19,806
Foreign born.....	27,648	16,938	10,710	55,296	33,876	21,420	55,296
Birthplace unknown.....	2,274	1,074	1,200	4,548	2,148	2,400	4,548

Taking into account only the 108,802 parents whose nativity is known, 41.56 per cent. of the white inmates of almshouses in the United States (men and women) is of the native white element and 58.44 per cent. is of the foreign element.

The actual nationalities of the 63,587 foreign parents of American paupers and the number of each nationality are given in the ensuing table, in which they are classed according to the elements of the population :

BIRTHPLACE OF FOREIGN PARENTS.

BIRTHPLACE OF PARENTS.	PAUPERS CLASSED BY ELEMENTS OF THE POPULATION.

tion whether pauperism is on the increase in the United States or not, and concerning the cost of pauperism, Mr. Frank B. Sanborn writes in *The Kingdom* for August 23, 1895:

"Taking the country through, and with relation to the gain in population, pauperism is not increasing—that is, there were as many of the public poor 50 years ago in the States then free, in proportion to the whole number of free inhabitants, as there are now. In the old slave States, where slavery took the place of pauperism, in some degree there has been an increase of paupers since emancipation, but not enough to overbalance the comparative decline of pauperism in the North and West since 1870.

"I say this with confidence, because such is the result of my observation and researches for the past 30 years, during which time I have studied the subject by the best light attainable, and for more than 20 years of which I was actively engaged as a State official in the charities of Massachusetts. It is not, however, by means of the national census, with all its cost and parade of tables, that this or any other safe result can be reached. A whimsical inconsistency, a perverse unreason, has attended the efforts (often considerable and well meant) of the Census Bureau to gather the facts of American pauperism. Probably the earlier censuses in which this was attempted (from 1850 onward) were comparatively more exact than the later ones, for the question had not then become so complicated as it has been since 1870. The multiplicity of charitable agencies, and the gradual separation of the poor into various subdivisions—the insane, the sick, the idiotic, the young children, the aged poor, etc.—have so confused the Federal enumerators and tabulators that their final results have been ludicrously inaccurate of late years. Even the larger States, after many years' experience in collecting the facts, do not always come very near the full aggregate of this much-divided pauper class. Add to this that the laws of the 44 States make different distinctions as to who is a pauper, and who is not, and it will be seen that the task of collecting exact statistics is not an easy one.

"No attempt is made to enumerate the poor who receive what is called 'outdoor relief,' the census-takers giving that up as hopeless. Indeed, it is difficult, but not impossible, at least by careful estimate, which would be better than the blundering positiveness of the table cited. In 1889, from the returns made by many States to the National Conference of Charities, revised by official documents, I estimated the number receiving outdoor relief in the United States at a given date as 250,000, and their cost at \$10,000,000. This would allow a little less than 80 cents a week to each. The average in Massachusetts was 84 cents; in New Hampshire more; in other States it varied, but on the whole, could not have been much less than 80 cents. At the time of the panic of 1893-94, the sum expended rose above \$16,000,000; it has fallen again to perhaps \$15,000,000. But for our lavish pension payments the outdoor relief would very likely rise to \$20,000,000 a year, or 28 cents per capita for our whole population of 70,000,000.

"I think the outdoor aid for the nation exceeds the sum paid for full support, not including that for the insane poor. In New Hampshire it is as \$200,000 to \$150,000; in Massachusetts as \$1,200,000 to \$1,300,000; in some States it is no more than a third of the full support; but in others (the majority in numbers if not in population), more than two-thirds of the poor-law outlay is for outdoor-relief. In the whole country probably \$25,000,000 is now paid for full support (indoor relief), including that expended for children in public homes, the insane poor in asylums, idiots, and the sick in public or publicly aided hospitals. These estimates amount to \$40,000,000 as the cost of pauperism in a year; it may even rise to \$45,000,000."

GREAT BRITAIN.

The paupers in actual receipt of public relief in Great Britain on one day number more than a million:

England and Wales, 1st of January, 1893.....	776,458	cost £ 8,847,678
Scotland, 14th of January, 1893,	193,496	" 912,838
Ireland, 8th of January, 1893,	102,865	" 1,054,514

1,072,819 £10,815,030

(Report of Local Government Board, England and Wales; Report of Board for Supervision of Poor,

The total number of indoor paupers reported in 1880 was 66,203, but see ASYLUMS concerning the ques-

Scotland; *Report of Local Government Board, Ireland, and Statistical Abstract, 1893, C—7143.*)

But the relief is not usually given permanently; to obtain the number of different individuals who receive relief during a year, we must multiply the daily number by 2.3. (This is the latest computation given in Mr. Charles Booth's paper before the Statistical Society, December, 1891. See also his *Pauperism, a Picture; and the Endowment of Old Age, an Argument.*) This gives a pauper class during any one year of about 2,460,000 persons, or 1 in 11 of the manual-labor class. In some rural districts every aged laborer is a pauper.

The maintenance of these paupers cost £10,815,030 per annum. But in addition to this public expenditure, the various charitable societies spend £10,040,000 annually (Mr. Mulhall, *Dictionary of Statistics*, p. 112), and the charity of individuals is known to be enormous. The numbers of the destitute class must therefore be largely increased. Mr. R. Giffen talks of the class of 5,000,000 "whose existence is a stain on our civilization" (*Essays in Finance*, vol. ii. p. 350). It is the lot of at least 1 of 5 of the manual-labor class—of 16 in every 100 of the whole population—to belong to this class.

As regards the 4,000,000 of persons in the metropolis, Mr. Charles Booth tells us that 37,670, or 0.9 per cent., are in the lowest class (occasional laborers, loafers, and semi-criminals); 316,834, or 7.5 per cent., in the next (casual labor, hand-to-mouth existence, chronic want); 938,203, or 22.3 per cent., form "the poor" (including alike those whose earnings are small, because of irregularity of employment, and those whose work, though regular, is ill-paid). These classes, on or below the "poverty line" of earnings not exceeding a guinea a week per family, number together 1,292,737, or 30.7 per cent. of the whole population. To these must be added 99,830 inmates of workhouses, hospitals, prisons, industrial schools, etc., making altogether nearly 1,400,000 persons in this one city alone whose condition even the most optimistic social student can hardly deem satisfactory (*Labor and Life of the People of London* (Macmillan, 1892, 1896, 7 vols.), edited by Charles Booth, 1891. Vol. ii., pp. 20-21).

The ultimate fate of these victims it is not easy adequately to realize. In London alone, in 1892, no less than 31 persons, of whom 13 were 50 years old and upward, were certified by the verdicts of coroners' juries to have died of starvation (C—476). Actual starvation is, however, returned as the cause of death in but a few cases annually; and it is well-known that many thousands of deaths are directly due to long-continued under-feeding and exposure. Young children especially suffer.

The average number of persons in London whose home is the "common lodging-house" is over 30,000; over 1100 are every night found in the "casual wards."

In London 1 person in every 5 will die in the workhouse, hospital, or lunatic asylum. In 1892, out of 86,833 deaths, 48,061 being 20 years of age and upward, 12,713 were in workhouses, 7707 in hospitals, and 471 in lunatic asylums, or altogether 20,831 in public institutions (Registrar-General's Report, 1892, C—7238, pp. 2, 72, and 96). The percentage in 1887 was 20.7 of the total deaths; in 1888 it rose to 22.2, in 1891 to 24.2, and in 1892 it was 23.9.

It is worth notice that a large number of those compelled in their old age to resort to the workhouse have made ineffectual efforts at thrifty provision for their declining years. In 1890-91, out of 175,852 inmates of workhouses (one-third being children, and another third women) no fewer than 14,808 have been members of benefit societies. In 4593 cases the society had broken up, usually from insolvency (House of Commons Return, 1891, Nos. 366 and 130—B). Considering that comparatively few of the inmates are children, it is probable that 1 in every 3 London adults will be driven into these refuges to die, and the proportion in the case of the "manual-labor class" must of course be still larger. And the number of persons who die while in receipt of out-door relief is not included in this calculation. As in 1892-93 the mean number of out-door paupers in the metropolis was 47,472 (C—7180, p. 266), and the average death-rate in London in 1892 was 20.3 per 1000, it may be assumed that at least 950 persons died while in receipt of out-door relief—often from its being insufficient.

In England and Wales in 1892, 66,424 deaths were registered as having taken place in workhouses, infirmaries, hospitals, and asylums, or 11.9 per cent. of the total deaths. Of these, 39,748 occurred in workhouses, 20,440 in hospitals, and 6236 in lunatic asylums.

The following statistics for different countries are gathered from *The Statesman's New Year Book* (1895):

	Number of Paupers.	Expenditure.
England and Wales (1894)	812,441	\$46,085,570
Scotland (1894).....	95,668	4,632,720
Ireland (1894).....	104,931	5,196,150
Great Britain and Ireland.....	1,011,540	55,914,440
France (1888).....	1,647,720	7,178,666
Germany (1885).....	1,592,386
Italy (1880).....	17,934,661
Austria (1891).....	310,645
Belgium (1892).....	3,564	181,220

Exclusive of vagrants and casual poor.

PAWN-SHOPS, MUNICIPAL.—The need of reliable pawn-shops, where, at low rates, the poor can borrow money, is, under present social conditions, admitted by almost all. In the United States some efforts in this direction have been made by private charitable organizations. In 1894 Rev. Dr. Greer, rector of St. Bartholomew's Protestant Episcopal Church in New York City, started an admirable pawnshop in connection with his parish, and out of this has grown the larger movement of a Provident Loan Society. The work of the European *Mont-de-Piété* (q. v.) is well known. In general, however, on the continent of Europe, pawn-shops are now conducted by municipalities, and the proposal to establish such municipal pawn-shops in England and America has many advocates.

Mr. Robert Donald, editor of *London*, gives in the *New Review* for December, 1894, a cogent plea for municipal pawn-shops. He says: "The following shows the different treatment extended to poor borrowers in the leading capitals of Europe. A loan of 25. *sd.* for one week pays interest per annum as follows: Paris, 0; Madrid, 6; Brussels, 7; Berlin, 12; London, 260."

The extent to which the poor of London are plundered by the pawn-shops justifies Mr. Donald's plea for improvement. This, he thinks, can best be done by putting all the pawn-shops under the municipality. He says: "There are many reasons why pawn-shops would be more economically managed under municipal control than under private ownership. There would be a decided advantage in having branches all over the city. Valuable articles pledged in one quarter would pay for small loans in poor districts. The smallest pawns do not pay the pawnbroker, even altho he does charge his 100 per cent. Supervision would not be less expensive under the County Council than at present. The officers would require to be well paid, as the success of the institution would mainly depend on their loyalty to the system and their method of valuation. There would be considerable scope for economy in the matter of rent. It would not be necessary to have anything like six hundred pawnshops."

According to an article by E. F. Baldwin in *The Outlook* for August 3, 1895, the English Government has been seriously considering the adoption of such a system, and to that end Lord Kimberley recently addressed a circular to her Majesty's representatives

abroad, and received from them reports on the system of pawnbroking which obtains in the countries where they reside.

From them we learn, according to the writer, that in Germany pawnbroking is conducted by the State, by the Gemeinde (parish), or by private persons under State supervision. The Berlin *Königliches Leihamt* is under the protection of the German Reichbank, which advanced the necessary funds. The pawn-shop usually advances on two-thirds of the estimated value of household goods, four-fifths on silver, and five-sixths on gold. During the year 1893, the sum of \$1,200,000 was lent on about 220,000 pledges. After payment of all administrative expenses and interest on capital, there remained a net surplus of over \$70,000, which was placed to the account of the reserve fund, and of which the interest is devoted to a charitable institution. Under the State system the interest on loans is 12 per cent., while under private management it is either 12 or 24 per cent., according to the amount of the loan. Under both systems the loan is contracted for six months; under the first, six months' grace is allowed, while under the second four weeks only. The State pawn-office is used by the middle rather than by the very poorest classes. Artisans and tradesmen head the list, widows and unmarried women follow, while day-laborers and factory workmen occupy the third place.

In Austro-Hungary there exists a system of *Ver-satzämter*, usually under the control of the municipalities, but more or less under the control of the State also. The prototype of them all is the so-called Imperial Pawn-office of Vienna, founded like any other charitable institution and intended solely as such. The Minister of the Interior nominates the officials and sanctions any important matter connected with the management. The original advances have not been paid off; the Imperial Pawn-office is entirely independent, and is annually adding to its cash capital from its own profits. The interest charged is at the uniform rate of 10 per cent. In 1893 the Vienna office received over 860,000 articles, for which it advanced \$2,100,000.

Italy is the home of the pawn-shop, since Savonarola is supposed to have established the first one. The Italian system does not allow loans on pledges to be granted for less than one lira (20 cents) or for more than 1000 lire. The advances on gold, silver, jewels, and other articles are in the same proportions as in Germany. Interest is charged at the annual rate of 5 per cent. for loans of from five to ten lire. On loans of from 10 to 20 lire the rate is 6 per cent., and on those above that figure 7 per cent. Besides interest, a charge of 1 per cent. is levied on the pawn-ticket when the loan is granted, but loans not exceeding 10 lire are exempt from this charge. Loans are granted for six months, with the power of renewal for a further six months. A special regulation permits renewals from six months to six months for a period of five years.

In France pawnbroking is now a municipal monopoly. In most instances it is created by the local authority and regulated by the State.

Private pawnbroking no longer legally exists, tho there are many *Marchands*

In Europe. *de Reconnaissances* who purchase pawn-tickets and resell them to the original holders with a profit of one franc a month for every ten francs in advance! The French *Monts-de-Piété* are, as a rule, self-supporting; the profits made on the larger transactions paying for the loss incurred on the smaller. It is said that advances from 60 cents to \$4.50 may be classed as unprofitable operations. Advances from \$4.50 to \$17 are profitable or not, according to the period during which they remain in pawn. Beyond this sum operations are always profitable. The pawn-shops are placed under the control of the local authorities; the Mayor of the town being *ex-officio* the President of the administration. Being called charitable institutions, they are as such exempt from stamp duties, and, further, when requiring funds are allowed to issue bonds. They are now empowered to make advances on public securities which are made payable to bearer, an average of two-thirds of the value being given. The rate is 6 per cent. This feature is of great benefit to the poorer classes, with whom investments in these securities are most popular. When necessary, they are thus enabled to pawn their small savings, instead of to part with them altogether. The newest use of the French *Monts-de-Piété* has been that of a storage-room for bicycles. Many riders have found it desirable to pawn their machines in the autumn, and to take them out again in the spring. At the head of the Paris pawn-shop is a Director, who is himself under the control of a Com-

mittee comprised of the Prefect of the Seine, the Prefect of Police, three members of the Municipal Council, three members of the *Assistance Publique*, and an equal number of citizens. The funds are derived from money invested by the public in *Mont-de-Piété* bonds, from the revenue from interest charged to loans, from interest on its superfluous funds, and from pecuniary guarantees required by statute from its functionaries. The minimum advance on pledges is three francs (60 cents); for the maximum there is virtually no limit. The duration of the loan is for one year, but after the expiration of this period the pawner is allowed a renewal. Interest at the rate of 3 per cent. is charged on the sum lent, and 3 per cent. for expenses in connection with the management, insurance, etc. A further tax of 1 per cent. is also levied on the full value of all pledges, thus making the total 7 per cent. Pledges which have not been renewed or redeemed within the course of a year are liable to be sold at public auction in the thirtieth month. In 1893, 1,300,000 articles were pawned, 1,200,000 redeemed, 800,000 renewed, and 200,000 sold. The surplus (\$70,000) was handed over to the hospitals of Paris. Statistics show that about one-fourth of the articles pawned undergo renewal, while only one-eighth come to be sold.

In Spain the system is connected with that of a savings-bank. The pawn-shop advances money at 6 per cent. a year, and depositors in the savings-bank are assured an annual income of 4 per cent., which is capitalized at the end of each year. This joint institution is under the protection of the Minister of the Interior. The general administration is under the supervision of a General Council, consisting of 30 members (appointed by the Government), whose services are entirely honorary and gratuitous. At the pawn-shop in 1893, the number of loans effected and renewed was about 175,000; the amount advanced was over \$2,000,000. The object is to advance money at 6 per cent. a year, which is recovered, together with the capital, at fixed periods—namely, for advances on jewels and plate, one year; clothing, etc., six months; and advances made on the guarantee of Government securities, four months. Deposits in the savings-bank are received both Sundays and week-days. Sums less than one peseta (20 cents) are not received as a first deposit. Every depositor may draw out the total amount, or a portion of the sum deposited, by giving notice to the administration. The money is usually paid within a week, but payment may be deferred for a period as long as five weeks if deemed advisable, thus avoiding the danger of a run on the institution. While the savings-bank pays interest at the rate of 4 per cent., the pawn-shop takes charge of the funds of the savings-bank, paying the bank interest at the rate of 5 per cent.; it then makes advances of the said funds for the security of articles pledged, charging interest at the rate of 6 per cent. Each institution thus makes a profit of 1 per cent., sufficient to pay expenses and to increase the capital. They have met all requirements and increased their capital without any assistance from the Commune, the Province, or the State. Hence the savings of the poorer classes, yielding them interest of 4 per cent., form the means of assisting the still poorer and perhaps more improvident classes, who can borrow at the rate of 6 per cent. a year, or one-half of 1 per cent. a month.

The reports include in addition those from Brussels, The Hague, Copenhagen, Stockholm, St. Petersburg, Berne, Lisbon, and Washington. The last of these tells us nothing new. There are no Federal laws in the United States in regard to pawnbroking, each State having its own regulations. The States in which most attention has been given to this question are those of New York and Massachusetts.

PEABODY, GEORGE, D. C. L., was born at South Danvers, Mass., 1795, received little education, and entered a store as clerk at an early age. In 1814 he began a dry-goods business in Georgetown, D. C., as partner with Elisha Riggs. He later had establishments in Baltimore, New York, and Philadelphia. In 1829 Peabody became head of the firm; in 1837 he removed to England; in 1843 he withdrew from the old firm of Peabody, Riggs & Co., and established a banking-house. He became very rich, and gave away large sums of money. His gifts, in all, amounted to about \$7,000,000. He declined a baronetcy which the

Queen offered him. The freedom of the City of London was given to him, and his statue placed in the Royal Exchange in 1869. He died in London, November 4, 1869.

One of the chief benefactions of George Peabody was the gift of \$2,500,000 to provide dwellings and lodging-houses for the poor of London. Of this £350,000 was given during his life, and £150,000 in 1873 by bequest. The fund was in the form of a trust, and is in care of a secretary and six trustees, one of whom is the United States Minister to England. Their annual report for 1890 is an interesting document and proves beyond question the wisdom of Mr. Peabody and the value of a good gift wisely bestowed. The fund which in 1873 was £500,000 has grown by the addition of rents and interest to a total of £1,023,446. The land and buildings under the care of the trust are valued at £7,233,845. Up to the end of the year there had been furnished to the artisan and laboring poor of London 5071 dwellings, 75 having four rooms, 1789 three rooms, 2401 two rooms, and 806 one room. The average rent of each dwelling was 4s. 9½d. per week, and of each room 2s. 1¾d.; the rent in all cases including the free use of water, laundries, sculleries, and bath-rooms. The highest rent charged is 7s. 6d. for some of the 4-room dwellings. The dwellings are not in a group, but are scattered over the city, apparently being placed where they will do the most good. That the plan of cheap dwellings contributes to the health as well as to the comfort of the poor appears from a glance at the vital statistics. The death-rate last year was 21.15 per 1000, or .85 per 1000 above the average for all London, but this was exceptional, the cause being an epidemic which last spring visited the sections where some of the dwellings are located. The infant mortality was 141.22 per 1000, or 21.37 below that of all London. The births were 38.49 per 1000; 9.41 above the London record. The trustees' report also gives the employment of each tenant, and the list covers nearly 100 trades and occupations from expert artisans to unskilled laborers.

PEACE UNION. See INTERNATIONAL ARBITRATION.

PEASANT REVOLT (1377-1381). An uprising of the English peasantry under the leadership of Wat Tyler (*q. v.*), Jack Straw, and the priest, John Ball (*q. v.*). The immediate cause of the revolt was the imposition of an unjust poll-tax, which was to be exacted equally from the poorest as well as the richest; but many other influences had prepared the way for an outbreak. The teachings of John Wyclif and his "poor priests" had very largely emancipated the minds of the laboring classes from the unjust authority of Church and king. John Ball (*q. v.*), called by the rich "the mad priest," had for years been circulating his leveling doctrine: "When Adam delved, and Eve span, who was then the gentleman?" In 1348 the Black Death had swept over England, carrying off more than half its population, and being especially severe among the poorer classes. As a result there was great scarcity of laborers, and for the first time they found themselves masters of the situation. The demand for workers was twice as large as the supply, and they soon began to reap the benefits of this condition of things. The villeins suddenly became conscious of their strength, and even dared to oppose their masters. The lords and landowners, then as now, at once called for the aid of the law, and enacted what is known as "The Statute of Laborers." This provided that no laboring man or woman, whether bond or free, should leave the parish in which he or she lived, and should receive the same wages as before the Black Death. All the lawyers in

the country were set to work undoing the movement of emancipation which had been in progress before the plague. It was found impossible to enforce the Statute of Laborers, for men were at this time too scarce and valuable to be put to death or imprisoned, and too poor to pay the fines levied upon them. However, oppression followed oppression until the poll-tax, in 1377, forced the exasperated peasantry to arms (June, 1381). The revolt spread like wild-fire over the country, and for a time the peasants carried everything before them, burning the records of their serfdom, and killing every lawyer who fell into their hands. The poorer artisans of London opened to them the gates of that city. They destroyed the palace of John of Gaunt and the houses of the wealthy; they burst into the Tower and beheaded the Bishop of Canterbury, but abstained from plunder, calling themselves "seekers of truth and justice, not thieves or robbers." They were finally met by the boy-king, Richard II., who promised to free them and their lands forever, and called himself their leader. They believed his promises and gradually dispersed, the assassination of their leader, Tyler, seeming to deprive them of unity and decision. The king then gathered a large army and marched through the land, ruthlessly executing hundreds of the working people and their leaders, and declaring his promises null and void. In this he was supported by the Parliament, which was composed of landowners. The peasants' revolt was, nevertheless, not a failure. It created a healthy respect and fear for the might of united and indignant serfs, and struck feudalism its death-blow. During the century and a half after the revolt, villeinage died out so rapidly that it soon became a rare and antiquated thing. Sixty years after a working man's wages commanded twice the amount of the necessaries of life which could have been obtained under Edward III.; while one hundred years after came what is usually called the "Golden Age" of English labor.

PEASANTS' WAR, THE, is the name usually given to the revolutionary uprising of the peasants of Southern and Central Germany in 1525. The miserable condition of the German serfs, the appropriation of the common pasture lands by the lords, the refusal of the lords to let their tenants fish in the streams or hunt in the woods, the increase of ground-rent, of sottage service, and of tithes, had led to small uprisings in Germany, all through the later Middle Ages. The *Bundschuh* (the shoe), which had been universally adopted as the symbol of these uprisings, had become known through all Germany; yet the revolts had been weak and easily put down. When, however, the Reformation gave the people a new impetus and a new hope, the peasants thought that now was their opportunity. They even at first looked to Luther to lead them. They plead the communistic practises and principles of early Christianity. The peasants

rose with religious zeal. The 12 principles they formulated show this. They were (1) the right of the peasantry to appoint their own preachers, who were to be allowed to preach the word of God from the Bible. (2) That the dues paid by the peasantry were to be abolished, with the exception of the tithes ordained by God for the maintenance of the clergy, the surplus of which was to be applied to general purposes, and to the maintenance of the poor. (3) The abolition of vassalage as iniquitous. (4) The right of hunting, fishing, and fowling. (5) That of cutting wood in the forests. (6) The modification of socage and average service. (7) That the peasant should be guaranteed protection from the caprice of his lord by a fixed agreement. (8) The modification of the rent upon feudal lands by which a part of the profit should be secured to the occupant. (9) The administration of justice according to the ancient laws, not according to the new statutes and to caprice. (10) The restoration of communal property illegally seized. (11) The abolition of dues on the death of the serf, by which the widows and orphans were deprived of their right. (12) The acceptance of the aforesaid articles, or their refutation as contrary to the Scriptures. Karlstadt and some of the Reformers joined the peasants. Luther, Melancthon, and others denounced them. Münzer accused Luther "of deserting the cause of liberty and of rendering the Reformation a fresh advantage for the princes, a fresh means of tyranny." The uprising began in Upper Suabia in the autumn of 1524, and gradually spread. When the convent of Kempten was captured by the peasants, January 1, 1525, the uprising became general from the Alps to the Hartz, and from the Rhine to Bohemia. With the exception of Thomas Münzer (*q. v.*) and Götz von Berlichingen, a notorious robber knight, the peasants had no leaders. They simply gathered in large masses of from 8000 to 30,000 men. They captured and plundered castles and monasteries, often with great cruelty. As soon, however, as they met disciplined armies, in the south under Truchsess von Waldburg, and in the north under Philip of Hesse, they were defeated. The peasants captured Waldburg, but could not hold it. The insurrection of Münzer, the prophet of the Anabaptists (*q. v.*) in Thuringia, broke out later in 1525, but in a few months all was over. The peasants were put down and punished with terrible cruelty. The whole country became one scene of devastation; even young children were cast "as Lutheran dogs" to the flames.

PEASE, EDWARD R., was born at Bristol, England, in 1857. His parents were Quakers, and his education was conducted by a private tutor. He was intended by his parents for a commercial occupation. He became a stock-broker in London; but led by the study of social conditions and principles, he gave up this position in 1886, and became an appren-

tice to the cabinet-making trade in a cooperative company, spending his spare time in studying labor questions, economics, and socialism. In 1883 he was one of the most active in organizing the Fabian Society (*q. v.*), the first meetings being held in his rooms, and in 1886 he became for a time its secretary. He traveled later in the United States, but returned to England, and became a member of the Alliance Cabinet-makers' Trade Union, the secretary of the National Labor Federation, and a most active worker in labor organization and reform. In 1890 Mr. Pease became paid secretary of the Fabian Society, and has remained so till the present. The work of the society had become so extensive as to oblige him to devote all his time to its interests. Besides his arduous work of secretaryship he is editor of the *Fabian News*. Both he and his clever wife, Marjory Davidson, are active members of the Society of the Friends of Russian Freedom, Mr. Pease acting for a time as its secretary. He was the delegate of the Fabian Society at the International Socialist Congress at Brussels. His home is at Limpsfield, Surrey.

PEFFER, WILLIAM ALFRED, of Topeka, Kans., United States senator, was born on a farm in Cumberland county, Pennsylvania, in 1831. At the age of 15 he began to teach school—taught during the winter and farmed during the summer. He took up land in Indiana in 1853; six years later left for Missouri, and in 1862 removed to Illinois because of the war, and enlisted as a private in the Eighty-third Illinois Infantry; was promoted in 1863 to second lieutenant, and served in various official positions. Mr. Peffer studied law in odd hours during the war, and when he was mustered out of service, in 1865, he began the practice of law at Clarksville, Tenn. Five years afterward he removed to Kansas, practised law, and established and conducted two newspapers—the *Fredonia Journal* and *Coffeyville Journal*. In 1874 he was elected to the State senate; and served as chairman of the joint centennial committee, a member of judiciary, and chairman of the committee on corporations. He was a Republican presidential elector in 1880. A year later he became editor of *The Kansas Farmer*, and began to give special attention to the condition of the agriculturalists of that State. As a result of his inquiry he became one of the leaders of the Populist movement; and was elected to the United States Senate as a member of the People's Party in 1891. Mr. Peffer has continued to be one of the foremost advocates of the Populist movement. In 1893 he instituted an inquiry as to whether the banks were complying with the requirements of the Government.

PENAL COLONIES. See **PENOLGY**.

PENITENTIARIES. See **PRISONS**.

PENOLGY is the science of the treatment of criminals. (See **CRIMINOLOGY**. For the statistics of crime, see **CRIME**; for the general subject of crime, see **CRIMINOLOGY**; for statistics as to prisons and prisoners, see

PRISONS; for various other subjects, see CONVICT LABOR, ELMIRA REFORMATORY, JUVENILE REFORMATORIES.) We consider in this article only the history of and views held to-day as to the treatment of prisoners; the article being largely abridged from the historical notes in the second annual report of the United States Commissioner of Labor (1886).

FORMER TIMES.

There seems to have come down to us less positive information concerning the prison system of the ancients than concerning any other portion of their domestic and public economy. This is doubtless owing in large measure to the division of all society, among all the early peoples, into two classes—slave and free; the former the larger, numerically. The free men, the independent classes, were few in number, and arrogated all power and property. There was no convict class in the modern sense of the words, but such as it was it was recruited from such socially and legally degraded multitudes as are not now found in European and American civilization. There is no proper analogy, therefore, between ancient and modern penal laws or ancient and modern methods of employing criminals at work. And there is still less foundation for a rational comparison of the respective theories or principles whence those laws of systems have sprung. In the ancient world—in every varied civilization which preceded the fall of the Roman world-empire in its Italian birthplace in 475 A. D. and even till the death of its eastern half at Constantinople, in 1453 A. D.—vengeance was the root of all punishment; retaliation was the basis of all legislation regarding it. The wrong-doer, originally the enemy of the man wronged, came, in the course of time, to be considered the enemy of the tribe or nation also, that is, the enemy of society. Therefore he was tortured or killed, or made to pay a compensating fine. If he could not do the latter he would probably be imprisoned; but more often he was made a slave. Prisons were scarce, dungeons were commoner, but neither were used when death, scourging, or enslavement was feasible. Such few of the upper classes—who did not do any work apart from that of a political or professional nature, or that involved in court attendance or the management of invested property—as were unfortunate enough to have to incur punishment, frequently suffered much from the nature of their imprisonment, but were not forced to work. Labor was for slaves and menials alone, whether in prison or out.

The following account of forced labor in mines, from Wilkinson, mainly translated from Diodorus Siculus, probably gives a truthful picture of what existed in other ancient countries as well as in Egypt:

The historian states that those who worked in the mines were principally captives taken in war, and men condemned to hard labor for crimes, or in consequence of offenses against the Government. They were bound in fetters and obliged to work night and day; every chance of escape being carefully obviated by the watchfulness of the guards, who, in order that persuasion might not be used to induce them to relax in their duty, or feelings of compassion be excited for the sufferings of their fellow-countrymen, were foreign soldiers, ignorant of the Egyptian language.

The Roman Empire shows us somewhat of the transition to the modern treatment of the prisoner, tho slavery was still the basis. To be sold into slavery, and therefore to labor of some kind, was the main punishment. By the law of the Twelve Tables, afterward repealed, the debtor could be sold to the "foreigner beyond the Tiber." Under the republic and later, the poor plebeian *cliens*, in debt to his patrician *patronus*,

became practically the latter's slave, by process of law, to pay his debt. The *paterfamilias*, as before noted, could sell his children into slavery. Under the empire slavery—always carrying civil death—was the punishment of the citizen who refused his name for the lists of the *ensor* or sought in any way to avoid military service. Augustus once revived an old law of the republic in order to sell into slavery a Roman knight who had rendered his two boys unfit for military service by cutting their thumbs. Thus slavery as a punishment took the place in a certain way of the modern system of punishment at labor.

A punishment similar to that of the reduction to

slavery, and in more common use, was condemnation to the mines—in *metallum*, in *opus metalli*. This involved loss of citizenship and was generally for life. Women so sentenced were commonly employed to assist in the lighter parts of the work—in *ministerium metallicorum*. Slaves so sentenced no longer belonged to the master. Convicts of this class were always transported to a foreign province. Spain was the chief penal colony, and the famous silver mines at New Carthage are said to have contained 40,000 of these slaves (including the criminal class), who were treated with great severity. From their labor the Government derived large profit. A sentence of a like kind, also involving the loss of civil rights, was that to the public works—in *opus publicum*; it resembled the *bagnes* of France and the *presidios* of Spain, and was undoubtedly their prototype. It appears to have embraced all kinds of labor upon fortification, roads, and harbors, and in the galleys. It was not visited upon patricians nor upon slaves, but only upon the ordinary body of citizens—the idle and vicious Roman mob.

One of the commonest punishments, next to tortures and whippings, was confinement in the *ergastulum*, or *pistrinum*, dark and gloomy cells. There were said to have been public *ergastula* also, which were probably merely dungeons. Most of these *ergastula*, however, were loathsome underground dungeons on the country estates, where refractory slaves were confined at night, loaded with chains, working the fields in the daytime, also in chains.

Of prisons properly so named, aside from the *ergastula* and *pistrina*,—the dungeons and cells of the patrician household,—there is little information. At Rome the *carceres*, called Mamertine and Tullian, were one great dungeon in two tiers, mostly underground. Its two parts were built at different eras. It was without light or ventilation, abounding in filth, and reeking with horrible odors. But no work was or could be done in it. There were other similar dungeons at Rome and throughout the provinces. The Roman prisons, like the prisons of all their predecessors and contemporaries in history, were simply places of brief detention or torture. Their principal punishments for offenses not deserving death or slavery were also those of the rest of the ancient world, namely, whippings, tortures, mutilations, fines, etc.; and as the class to whom these penalties were meted out was principally the unlucky slaves, the individual master, not the State, adjudged them and enforced them.

In the prison systems of the Middle Ages we find the Roman system, mingling with the Germanic, slowly modified by the humanizing influences of Christianity, and then growing into a system of torture as Christianity became dehumanized in the institution of the Inquisition.

The Middle Ages.

In the time of Tacitus, the German slaves seem to have been composed chiefly of prisoners of war or persons condemned to slavery as a punishment for crime.

At quite an early period, however, the payment of a composition, afterward called the *wergeld*, became one of the principal methods of expiating crime. The amount of this composition depended on the social importance of the family injured, and a person committing a murder was allowed to purge himself of the crime by making a pecuniary composition satisfactory to the family of the deceased. Later this was accompanied by another fine, called *fredum*, which was paid to the State.

The settlement by composition was general, since nearly all crimes were considered as private injuries.

Only two offenses were accounted crimes against society in the time of Tacitus, and as such punished by death; the one, treason and desertion to the enemy; the other, cowardice and a secret offense against decency which modern laws leave unpunished.

However, the Christian religion, very soon after its establishment and recognition, began to exercise great influence on the criminal codes of Europe.

The new religion instituted three ideas regarding the treatment of criminals, which were new to all the world: Firstly, expiation instead of vengeance; secondly, a gradation of penalties or penances suited to the various grades of crimes; thirdly, the reformation of the offender.

Never was the authority of the Church over temporal society greater than from the sixth to the tenth century.

Having acquired great influence in the legislative and judicial assemblies by means of intellectual superiority, the priesthood always inclined the balance in favor of justice for all, of equality before the law;

and, if it was at all partial, it would be toward the poor, the weak, and the defenseless.

In its own punishments it imposed rigorous penances, it is true, but temporary in character, even for the greatest criminals. In the establishment and administration of these penalties it occupied itself first with the reclamation of the sinners; the protection of society and the maintenance of public order were, for it, interests of only secondary importance.

In the following period a reaction is manifested against the insufficiency of the guarantees which such a régime gives to a society agitated by so many troubles and disorders. Feudalism, which about the eleventh and twelfth centuries begins to dominate all European nations, even to their Oriental colonies in Palestine, bases itself, on the contrary, upon the principle of material force and intimidation.

Throughout the period of the existence of the feudal system in its strength it is, perhaps, vain to search for precedents of the employment of convict labor; for during the prevalence of this system, when each petty feudal lord held his own little court, and tried his vassal in accordance with his own notions of justice, it would be unreasonable to expect that stability of judicial institutions which alone can give birth to jails, workhouses, and houses of correction.

In such times we may look for sentences that are capable of speedy execution; and so we find that gradually, as the feudal system arose, the punishments became more generally corporal and capital, increasing in severity as the influences of the Church became less general.

The idea of the reformation of the offender was lost along with the temporal supremacy of the Church, and lay neglected until almost the dawn of the present century.

The other two principles of punishment which we owe to Christianity—those of expiation instead of vengeance, and of a gradation of sentences proportioned to the magnitude of the crime—remained indeed; but only in name, for the punishments during this feudal age increased so much in severity and cruelty as to rival those of savage nations.

The Church, which had formerly been such a power for good, became injuriously affected, during this period, by the struggle which it made to preserve its autonomy and at the same time to hold ecclesiastical feudatories. The result of such a struggle was that it lost much of its sacred character, and the ecclesiastical powers became as cruel in their punishments as the temporal lords themselves.

The most common punishments were naturally those most easily inflicted. Offenders paid in their persons; they were put to death with every variety of the capital sentence; were branded, mutilated, or sold as slaves. They were fined also, were degraded, or forfeited civil rights, or yet again were simply banished from their homes. Enforced detention, incarceration within four walls, was another method of coercion which grew and gained favor under the feudal system. The lord temporal or spiritual or corporate body could thus hold the vassal safe until he yielded fealty or submitted to extortion. A dungeon told no tales, and served conveniently to bury the victims of medieval oppression.

GREAT BRITAIN.

In England the first steps were taken toward modern methods. Freedom from illegal arrest was sought in the Great Charter, and, altho often in danger, it was confirmed finally and beyond all question by the Habeas Corpus act passed in the reign of Charles II. But the theory was better than the practise; numbers always languished in jail, the victims of needlessly severe or misinterpreted laws, who nowadays would have been at large. Through long years of trouble and disquiet, when the country was torn with religious and political dissensions, the prisons were always full. Intolerance appealed to the strong arm, and the jail was the ante-chamber of the scaffold or stake. When party warfare ran high, when kings struggled for larger powers or their ministers and myrmidons ruled with a high hand, incarceration was the easy recompense for all on the losing side. The commercial laws of a nation wedded to trade kept a large contingent always in jail. The debtor was at the mercy of his creditor, who could command the best efforts of the law to assist him in recovering his own again. Irregularity in the administration of justice contributed largely to fill the prisons. Jail deliveries were frequently delayed indefinitely; while, even when tardy trial ended in an acquittal, release was not always accorded, and innocent men, unable to meet extor-

tionate demands in fees, were carried back to prison. This was one reason why jails were full; yet another was the laxity or entire absence of discipline which suffered the families of accused persons to share their confinement. Under such conditions, more or less universal, the state of prisons, not in England alone, but throughout the then civilized world, was deplorable in the extreme. The penalties inflicted were purely personal, and, so to speak, final—such as chastisement, degradation, or death. England had no galleys, no scheme of enforced labor at the oar, such as was known to the nations of the Mediterranean seaboard, no method of compelling perpetual toil in quarry or mine. The germ of transportation, no doubt, was to be found in the practise which suffered offenders who had taken sanctuary to escape punishment by voluntary exile, but it was long before the plan of deporting criminals beyond seas became the rule. In Henry VIII.'s time, says Froude, "there was but one step to the gallows from the lash and the branding-iron." Criminals did not always get their deserts, however.

As a matter of fact, offenders far too often escaped scot-free through the multiplication of sanctuaries, which refuges, like that of St. Martin's-le-Grand, existed under the very walls of Newgate, the negligence of pursuers, and not seldom the stout opposition of the inculpated. Benefit of clergy, claimed and conceded on the most shadowy grounds, was another easy and frequent means of evading the law. Some judges certainly had held that the tonsure was an indispensable proof; but all were not so strict, and "putting on the book," in other words, the simple act of reading aloud, was deemed sufficient. So flagrant was the evasion of the law that jailers, for a certain fee, would assist accused persons to obtain a smattering of letters, whereby they might plead their "clergy" in court. It may be added that, altho the abuse of the privilege was presently greatly checked, it was not until the reign of William and Mary that benefit of clergy was absolutely denied to burglars, pickpockets, and other heinous offenders.

The following extract from Eden's *State of the Poor* will give the reader some idea of the crime and lawlessness rampant in the reigns of "Good Queen Bess" and her immediate predecessors, a consideration of which may serve, in some measure, to excuse the severity of the legislators of that day, when England, social, industrial, and economic, was still in a formative stage, and those in authority as unskilled in governing as the masses were untaught in obedience: "Of the regular police of the country, during the reigns of Henry VIII. and Elizabeth, it does not appear that history has furnished us with many proofs; the nation was still far from having attained what could be called a state of civilization and order; and the principal difference between the enormities committed in ancient times and in the fifteenth century seems to have been that, in the former, large bodies of men, headed by a desperate chieftain, carried on a species of civil war against their neighbors, and, in the latter, every part of the kingdom was infested with vagabonds and robbers. Writers who contend that severity of punishment is not the best preventive of crime are fully justified by the history of this period; never were severe laws issued in greater abundance, nor executed more rigorously, and never did the unrelenting vengeance of justice prove more ineffectual. The prisoners for debt in the different jails in the kingdom, are stated by Mr. Hume, on the authority of an act of Parliament passed in 1512, to have exceeded the number of 60,000, and Harrison assures us that the king executed his laws with such severity that 72,000 'great and petty thieves were put to death during his reign.' He adds that even in Elizabeth's reign 'rogues were trussed up apace,' and that there was not 'one year, commonly, wherein 300 or 400 of them were not devoured and eaten up by the gallows, in one place and another.' This account of the disorderly state of the kingdom is strongly corroborated by a statement preserved by Strype, which was written by an eminent justice of the peace in Somersetshire, in the year 1596, five years before the memorable act for the relief of the poor. In enumerating the disorders which then prevailed in that county, the author informs us that '40 persons had there been executed in a year for robberies, thefts, and other felonies; 35 burnt in the hand; 37 whipped; 183 discharged; that those who were discharged were most wicked and desperate persons, who never could come to any good, because they would not work.'" Soon, however, we have the beginnings of the system of enforced labor

Amount of Crime.

and also of transportation. In 1610, by order of the king, 100 dangerous rogues were banished to Virginia.

Under Charles I., in 1630, the following order of privy council was issued:

"That the correction houses in all counties may be made adjoining to the common prisons, and the gaoler to be made governor of them that so he may employ to worke prisoners committed for small causes, and so they may learne honestly by labour, and not live idly and miserably long in prison, whereby they are made worse when they come out than they were when they went in; and where many houses of correction are in one county, one of them at least to bee neare the gaole."

Haydn, in his *Dictionary of Dates*, says that transportation was first authorized by the 18th Charles II., chap. 3 (1666), judges being given power to sentence offenders to be transported "into any of his majesty's dominions in North America." Banishment, however, established by the act of 1507, did not differ materially from transportation provided later.

Reference may here be made to the system of pardoning criminals, especially from prisons and jails, if not imprisoned for too heinous offenses, as offenses were then judged, on condition of accepting military service. This system, which has in it the idea of recompense to the State by way of a service for which there is much demand in the crude and formative times of nations, was undoubtedly of early vogue in Great Britain. A single extract from the history of Newgate will illustrate this:

"Release from prison was still, as before, and for long after, frequently accompanied by the penalty of military service. This had long been the custom. On declaration of war in the earlier reigns, it was usual to issue a proclamation offering a general pardon to those guilty of homicides and felonies on condition of service for a year and a day. Even without this obligation prisoners in durance might sue out a pardon by intercession of some nobleman serving abroad with the king. But later on, the release was distinctly conditional on personal service."

Hard labor was first introduced into English prisons, to any large extent, in 1706. During the sixteenth and seventeenth centuries paupers and vagrants were generally considered criminals, but under the workhouse acts, which from 1697 are thickly sown through the statute-books of the realm, the unfortunate poor are treated as a class by themselves, demanding sympathy and support rather than punishment. Yet this change was of slow growth. For two centuries the lines of separation are not drawn sharply in the laws, and probably still less so in actual practise. The workhouse was, however, in its conception and in fact, like the American poorhouse, a place of relief, and only incidentally, and for certain classes, perhaps a place of punishment by labor; while the house of correction was just as significantly a place of punishment generally, both by labor and otherwise, and only casually at first, the more so later on, as the harshness of the earlier times was softened into the tenderness and sympathy of the later, a house of relief for wretchedness and misfortune.

Employment was provided with a view to profit, and for the purpose of turning pauper labor to account, regardless of its effect upon the labor market and the position of the independent laborer. In some instances, however, this effect seems to have been in some measure foreseen, for a Worcester act provides "that no cloth or stuff, either woollen or linen, manufactured in the workhouse or houses of correction, shall be sold by retail within the city of Worcester and the liberties thereof, by any officer or agent of the said workhouse, on pain of forfeiting double the value thereof to any person who shall sue for the same." The cloth and stuff made in the workhouse must, therefore, be used by the inmates or else be sent to a distance.

We now come to the times of John Howard (*q. v.*). Howard began his journeys of inspection in 1773. The prisons of the kingdom were a disgrace to humanity; they were for the most part poisonous, pestiferous dens, densely overcrowded, dark, foully dirty, not only ill-ventilated, but deprived altogether of fresh air. The wretched inmates were thrown into subterranean dungeons, into wet and noisome caverns and hideous holes to rot and fester, a prey to fell disease, bred and propagated in the prison-house, and deprived of the commonest necessities of life. For food they were dependent upon the caprice of their jailers or the charity of the benevolent; water was

denied them except in the scantiest proportions; they were half naked or in rags; their only bedding was putrid straw, reeking with exhalations and accumulated filth. Every one in durance, whether tried or untried, was heavily ironed; women did not escape the infliction. All alike were subject to the rapacity of their jailers and the extortions of their fellows. Jail fees were levied ruthlessly; "garnish," also the tax or contribution paid by each individual to a common fund to be spent by the whole body, generally in drink. Drunkenness was universal and quite unchecked; gambling of all kinds was practised; vice and obscenity were everywhere in the ascendant. Idleness, drunkenness, vicious intercourse, sickness, starvation, squalor, cruelty, chains, awful oppression, and everywhere culpable neglect—in these words may be summed up the state of the jails at the time of Howard's visitation.

Says Major Griffiths, writing in the *Encyclopedia Britannica*:

"It must be borne in mind that all this time the prisons were primarily places of detention, not of punishment. The bulk of those committed to their safe keeping were accused persons awaiting trial in due process of law, or debtors; and of these again by far the most numerous class were the impecunious and the unfortunate, whom a mistaken system locked up and deprived of all means of paying their liabilities. Now and again an offender was sentenced to be imprisoned in default of payment of fine, or to pass the intervals between certain periods of disgraceful exposure in the pillory. Imprisonment had as yet no regular place in the code of penalties, and the jail was only the temporary lodging of culprits duly tried and sentenced according to law. The punishment most in favor in these ruthless times was death. The statute-book bristled with capital felonies, and the gallows was in perpetual requisition. These were days when the pickpocket was hanged; so was the sheep-stealer, and the forger of one-pound notes. Well might Sir Samuel Romilly, to whose strenuous exertions the amelioration of the penal code is in a great measure due, declare that the laws of England were written in blood. But even then there was another and a less sanguinary penalty. The deportation of criminals beyond seas grew naturally out of the laws which prescribed banishment for certain offenses."

Later, when the system of transporting convicts to the colonies of North America was destroyed by the declaration of independence of the United States, the suggestions of Howard, Eden, and other reformers had weight, and led to the passage of the 16th George III. (1776), providing for the labor known as the hulks.

The hulks were old vessels lying at the mouth of the Thames and in other harbors in which prisoners were now, for the first time, confined and employed in dredging and other coarse labor.

But the great result of the agitation of Howard and of the commission appointed, of which he was a member, was the act of the 10th George III., chap. 74 (1779); a very important act, since it embraced in its conception, for the first time, the whole idea of the modern reformatory prison.

It provided for the erection of penitentiary houses (probably the first use of the term in English law), with storehouses, workhouses, lodging rooms, infirmary, chapel, burying ground, prison, kitchen garden, airing grounds, a governor, clerk, chaplain, surgeon or apothecary, store-keepers, taskmasters, and a matron, with salaries attached to be paid out of the profits of the work performed by the prisoners. Little was done, however. The system of the hulks was still continued. A plan of transportation was tried through the medium of contractors. "An act of 1788 empowered his majesty, under his royal sign manual, to authorize any person to make contracts for the transportation of offenders, and to direct to whom security should be given for the due performance of the contract."

Attention having been turned to the virgin land of Australia, in May, 1787, the first band of transports left for Botany Bay, and in the succeeding year founded the colony of New South Wales. The system of transporting felons to Australia continued in such force that, in fifty years from the date of its introduction (1787-1836), 100,000 convicts, including 13,000 women, had been shipped to the Australian penal colonies.

This system prevailed through all the first half of the century. The penal colonies at first had a desperate battle for existence. Later a few free families were induced to settle among them, but they were lost

Hard Labor.

John Howard.

in the bulk of the convicts. The convicts were employed under government control in various works.

Transportation.

The educated among them were made clerks and even given places of trust. When a new batch of convicts arrived, the best were assigned to government offices or were let out to employers. Others were worked as road parties in chain-gangs, and the worst sent at last to penal settlements, which became cesspools of iniquity. Finally, as the number of free colonists grew, the opposition to the convicts became very strong, and between 1835 and 1840, a party arose in New South Wales pledged to procure the abandonment of transportation. The convicts, the educated, were said to demoralize the colonies, and the road gangs and penal settlements to be worse yet. In 1857 an act was passed limiting transportation to terms of fourteen years, and in 1867 it was abolished altogether.

The penitentiary scheme had not been abandoned on the adoption of transportation. It was kept alive by Jeremy Bentham, who, in 1791, published a

work on prison discipline, entitled *The Panopticon, or Inspection House*, and followed it next year by a formal proposal to erect a prison house on his own plan. Bentham's main idea was "a circular building, an iron cage glazed, a

glass lantern as large as Ranelagh, with the cells on the outer circumference." Within, in the center, an inspection station was so fixed that every cell or part of a cell could be at all times closely observed, the prisoners being themselves at liberty to communicate with visitors and make known their complaints by means of tubes. He hoped to effect much in the way of reformation from a system of solitude or limited seclusion, with constant employment on work, in the profits of which the prisoners were to share. His project was warmly approved by Pitt, but secret influences—the personal hostility, it was said, of George III. to Bentham as an advanced radical—hindered its adoption until 1794. A contract was then made between the treasury and Bentham, by which the latter was to erect a prison for a thousand convicts, with chapel and other necessary buildings, for £19,000 [\$23,340]. A portion of this sum was advanced, and Bentham also acquired on behalf of the Government certain lands, but the undertaking never took practical shape. Nearly fifteen years later, when the penitentiary question was again revived, Bentham's claims were referred to arbitration, and the Government proceeded to erect the prison on its own account, "fully recognizing the importance of attempting reformation by the seclusion, employment, and religious instruction of prisoners." This had been tried already on a small scale but with satisfactory results, first at the Gloucester prison, erected in 1791. It was now tried on a large scale at Millbank, yet generally the condition of the prisons was very bad. Even in London itself, within easy reach of this palatial Millbank penitentiary, the chief prison of the city, Newgate, was in a disgraceful condition. This had been exposed by a parliamentary inquiry as far back as 1814, but nothing had been done to remedy the evils laid bare. All the shameful conditions of neglect, ill-treatment, and overcrowding were present in Newgate, and to the same extent as in any of the provincial prisons. Griffiths says that:

"In 1818, out of 518 prisons in the United Kingdom, to which a total of upward of 100,000 prisoners had been committed in a year, only 23 prisons were divided according to law; 59 had no division whatever to separate males from females; 136 had only one division for the purpose; 63 had only two divisions; and so on. In 445 prisons no work of any description had been introduced for the employment of prisoners; in the balance some work was done, but with the most meager results. . . . All prisoners passed their time in absolute idleness, or killed it by gambling and loose conversation. The debtors were crowded almost inconceivably."

In many of the prisons toll was carried on for toil's sake; at the treadmill, or at the shot drill, carrying shot from one side of the prison yard to the other. Says Major Griffiths:

"The state of the female side had already attracted the attention of that devoted woman, Mrs. Fry, whose ministrations and wonderful success no doubt encouraged, if they did not bring about, the formation of the prison society. Mrs. Fry went first to Newgate in 1813, but only as a casual visitor. It was not till 1817 that she entered upon the great and noble work with which her name will ever be associated. She worked

a miracle there in an incredibly short space of time. The ward into which she penetrated, altho strongly dissuaded by the officials, was like a den of wild beasts; it was filled with women unsexed, fighting, swearing, dancing, gaming, yelling, and justly deserved its name of 'hell above ground.' Within a month it was transformed, and presented, says an eye-witness, "a scene where stillness and propriety reigned." The wild beasts were tamed. It was not strange that such marvelous results should be bruited abroad, that public attention should be attracted to Mrs. Fry's labors, and that others should seek to follow in her footsteps. Movements similar to that which Mrs. Fry headed were soon set on foot both in England and on the Continent, and public attention was generally directed to the urgent necessity for prison reform. . . . A small band of earnest men, philanthropists and members of the Society of Friends, formed themselves into an association for the improvement of prison discipline, and devoted themselves with rare energy and singleness of purpose to their self-constituted task. They perambulated the country, inspecting all the prisons; they issued lengthy interrogatories to prison officials; they published periodical reports giving the result of their inquiries, with their views on the true principles of prison management, and much sound advice, accompanied by elaborate plans, on the subject of prison construction."

This and ensuing agitations gradually brought in the present system. Under this convicts are sentenced to penal servitude.

A sentence to penal servitude of male convicts consists of three parts: First, a period of strict confinement; second, a period on public works; and third, a period on license if a remission of any portion of the sentence has been earned.

The first period of the sentence in all cases lasts for nine months, during which each convict works, sleeps, and eats in his own cell. The men are employed in tailoring, hammock and bag making, shoemaking, mat making, weaving, oakum picking, threading fire-lighters, and basket making. The women during this period are mostly employed in needle-work and knitting.

Present English System.

At first a considerable quantity of the products thus made was sold; but opposition to this on the part of the public was after a while aroused. The Prison Labor Reform Association requested the commissioners who were appointed in 1878 to inquire into and report on the working of the penal servitude acts; the nature, extent, and value of the labor performed in the convict prisons, and also the manner in which manufactured articles were sold and the prices obtained, and this was done. It was sought to lessen opposition to the system by employing the convicts, as far as possible, in the manufacture of articles designed for the use of the government departments. The tailors, for example, were employed in making garments for the convicts; others, in making bags for the post-office, coal sacks, and hammocks and bags for seamen. Competition with outside makers was thus speedily reduced to small dimensions.

When the convicts complete their first and shortest period of imprisonment they are transferred to other prisons and are then employed on public works. This, the second, is by far the longest period of convict life, and their employment during it is of much the greatest importance from several points of view. Of these public works a very important one was the construction of the breakwater at Portland harbor, recommended by a select committee on harbors of refuge in 1843.

In addition they have also been extensively engaged in building prisons. Since 1863 nearly 5000 cells have been erected entirely by convict labor, in addition to other buildings for the officers. The actual cost to the Government for these buildings between 1863 and 1885 was \$358,700, an estimated saving of \$277,700, when compared with their cost by contract labor.

While there is no thought in Great Britain of abandoning the system of employing convicts at productive labor, it is yet an embarrassing and anxiously mooted question, first, where work can be found for them to do which they are capable of performing without competing with persons outside; and, second, how the cost of doing the work, especially for other departments of the Government, shall be calculated. With regard to the first inquiry: Various public works have been planned quite similar to those already completed—the building of harbors, forts, and the like—enough to last for several years. Another kind

of work has been that of reclaiming land. An instance is the Dartmoor region, where a very considerable tract has been reclaimed and is now used for farming purposes. Fifteen hundred prisoners at a time have been employed there in the open country, without any wall to secure them or chains to fetter them, but during a long period of employment there has never been any difficulty with them in the matter of control or safe-keeping. This has not been a paying undertaking, it must be said, however, for the soil was of the poorest, the climate was unfavorable, and much preliminary labor was expended in drainage and removal of rocks.

FRANCE.

In France one of the first developments out of mediæval times was condemnation to the galleys or *galères*.

In the most ancient times to row in the galleys was considered honorable, and the early Greek oarsmen were generally voluntary recruits. Gradually, however, the social standing of the manning crew was lowered; first, prisoners of war were placed at the oars, then slaves, and finally the convicted criminals.

In France the punishment of being sentenced to the *galères* is of comparatively recent origin. Philip IV., the Fair (1285-1314), is the first king of France who had rowing galleys. Charles Cœur, purser of Charles VII. (1422-61), possessed four galleys, which, after the former's trial and conviction, were sold to Bernard de Vaux, of Montpellier, who was then created "general of the *galères*," one of the grand officers of the Crown, and placed in command of that part of the French navy.

A convict sent to the *galères* was branded with red-hot irons, leaving an indelible mark. First, the three letters GAL were used; later on, only two, either T F (*Travaux forcés*) or T P (*Travaux à perpétuité*). In the time of Charles VIII. (1483-89), the galley men were subjected to other, even more cruel, mutilations, such as slitting the nose and the tongue and clipping the ears, but in the same reign these were abolished.

The crimes and offenses punished with sentence to the galleys were sorcery, blasphemy, forgery, murder, smuggling, poaching, fraudulent bankruptcy, etc.

Closely connected with the establishment of the galleys are to be found the rudiments of the penal institution called *bagne*, bagnio. The name is derived from a prison which existed in Constantinople; this was a long one-story building with very high walls. On the inside, beds, or more properly bunks, were ranged closely against the walls, leaving but a central alley where great quantities of water were gathered for the baths; from this fact the Italians called the prison *bagnio*, or bath, which name was subsequently applied to all institutions of a similar character. Tournefort describes it as being one of the most horrible prisons that ever existed.

The Galleys.

The French *bagnes* were at first old hulks, but when, under Louis XV. (1715-74), the rowing galleys were abolished, *bagnes* were built at Toulon, Brest, Rochefort, and Lorient, where the convicts were employed in making ropes, sails, etc., and paid a few cents a day, with which they were allowed to buy tobacco, etc.

The labor in the bagnios was very severe; the convicts were chained and heavily ironed, and constantly under strict surveillance and discipline. At Brest the precaution was taken to place two cannons, loaded with canister, at each end of each room. These cannons were pointed at the bunks, and were always ready for action in case of a general insurrection or outbreak on the part of the convicts. Lepelletier says, in connection with this precaution, that, "thanks to it, general tranquillity was but rarely disturbed in a serious manner."

In 1828 the bagnio of Lorient was discontinued; in 1854 those of Brest and Rochefort, and now the entire system is abolished, and deportation to the penal colonies takes its place.

Imprisonment at Toulon was for ten years; that at Brest and Rochefort for ten years, and in certain cases for life.

The total expenses at the bagnio of Toulon for the year 1870 were 615,633 frs. (about \$123,126), while the income from the labor of the convicts amounted to only 239,548 frs. (about \$47,908).

Other French Prisons.—Careful investigation leads to the conclusion that imprisonment in the other French prisons was unaccompanied by labor till nearly the close of the eighteenth century. Prison life in the Bastille, the Conciergerie, the Grand and the Petit

Châtelet, For-l'Évêque, l'Abbaye, Bicêtre, La Force, Saint-Martin, Saint Eloi, and la Salpêtrière was either of great severity or of great laxity. The prisoners were either kept in dungeons, *cachots*, *oubliettes*, *cabanons*, *au secret*, without sufficient air, room, food, clothing, and other necessities of life; or they could congregate, converse, play games, eat and drink what they could afford to pay for, and live in rooms which they could rent at prices regulated by a fixed tariff; but always in enforced idleness and without distinction of age, sex, or crime.

By a declaration of King Louis XVI., 1780, it was directed that airy and spacious infirmaries should be constructed for the sick, that separate places of confinement and courts should be provided for men and women and for prisoners of different classes, and that all underground dungeons should be abolished.

In consequence of this royal declaration several important changes took place. Little attempt was made to introduce any kind of regulated labor in any of the prisons of Paris or of the provinces. The enforced idleness of the prisoners, taken in connection with the crowded condition of nearly all the prisons, became rapidly a fertile source of diseases of all kinds, predominant among them scurvy of the most malignant type.

Howard, writing about 1784, says: "The French are now sensible of the bad policy of confining persons in idleness; for of late they have here [Bicêtre] set their prisoners to work."

Gradually reforms came in; prisoners of different sexes were placed in separate places of detention, as were also juvenile offenders, for whom special houses of correction were established from 1831 to 1836, with an experimental agricultural station at Metray in 1839, which has so far proved to be beneficial and truly reformatory to the young offenders. The following is the modern system:

All penal establishments, excepting those for military and naval convicts, which the war and navy departments respectively control, are placed under the authority of a central direction which is dependent on the home department.

Present System.

French law inflicts four sorts of penalties besides death:

A. Penal servitude either for life or for a term of years. Convicts so sentenced are transported to ultramarine settlements, where by law they are employed at the hardest labor for the exclusive benefit of the Government and without being entitled to the slightest remuneration. As will be stated subsequently, the rigor of these legal requirements is much tempered in their application. Women sentenced to penal servitude are very seldom transported, and then only at their request and in particular cases; for instance, when their husbands are transported and they are allowed, by special favor, to join them. Usually they pay their forfeits in one of the penitentiary houses, of which mention is made hereafter. The places of transportation are two in number—New Caledonia for European convicts, and French Guiana for convicts natives of the African and Asiatic colonies. The whole number of convicts who were transported during the year 1884 was 2539; 1410 of whom were Arabs of Algeria.

B. Confinement for life, inflicted only on persons above sixty years of age or in a few special cases, or for a term of years not under five. Convicts so sentenced are confined in the central prisons (*maisons centrales de force*), where they do certain work not necessarily hard, determined in accordance with their individual aptitude, and the product of which may be in part assigned to their own benefit at the will of the Government. The central prisons are five in number—four for male, and one for female convicts. The total number of prisoners in them was, in 1884 (31st of December), 3746 men, and 220 women.

C. Imprisonment for a term of not more than five years, inflicted for minor offenses. Convicts of this class are confined in the central houses of correction (*maisons centrales de correction*), or, when the terms of their penalty do not exceed one year, in the common departmental prisons. They are also required to work, but enjoy the privilege of choosing the sort of labor they like, as far as the special regulations of their place of confinement make it possible, and they have a legal claim on a share of the products of their labor. The central houses of correction are fourteen in number—ten for male, and four for female convicts. The sum total of the convicts confined in them was, in 1884, 8873 men, and 997 women.

Besides, there are in Algeria two central houses, one

for male, the other for female convicts, and one agricultural penal settlement for male convicts. In 1834 the sum total of the penitentiary population of Algeria was 1062 men and 23 women. We must also mention two agricultural penal settlements for male convicts—most of them Arabs—in Corsica. Their inmates are included in the above figures.

The departmental prisons—which are the property, not of the State as the other penitentiary buildings, but of the departments (although under the management of the central penitentiary administration)—are 982 in number, one at least for each tribunal. In 14 of them the cellular system exists. The average aggregate population of these institutions is about 29,000 individuals of both sexes, including the prisoners who are temporarily placed there under arrest before trial.

D. Detention for a term of years, decreed for particular offenses of high treason or of a political character. Convicts of this kind were formerly confined in fortresses; now they pay their forfeit in private cells of certain prisons. They are not constrained to labor, and are governed by special and comparatively lenient regulations.

Another kind of penal establishment may be mentioned, specially designed for convicts, under age, of both sexes, that is, boys and girls under sixteen years of age sentenced to a minor punishment, and who are judged "to have acted without discernment." They are placed in special establishments of a reformatory character, where they are compelled to certain labors and are taught manual trades. These establishments are six in number for boys—five agricultural settlements, where mechanical trades also are practised, and one maritime settlement. Their total population was, in 1833 (31st of December), 2170 boys. In addition, twenty-one private houses are allowed to receive boys of this class under the superintendence of the Government's agents. They contained, in 1834, 2093 boys.

Girls of this class are usually committed to private charitable houses, which receive from the Government pecuniary help and are controlled by the penitentiary agents. These houses contained, in 1834, 1193 girls.

Two systems are in practise for the employment of convict labor, viz.: (A) by contract, and (B) for public account.

A. This system is practised in fifteen of the nineteen central prisons and houses of correction, according to the following regulations:

For each of these houses the Government enters into a contract with a private citizen—the lowest bidder at a public auction held for this purpose—who, in return for a certain sum per day per head for a term of years, provides for the maintenance of the convicts, in compliance with specified conditions.

GERMANY.

In Germany, systems of employing the prisoners early sprung up.

The various States have pursued, however, different systems in the utilization of such labor, and some have been more progressive than others in securing a good prison system.

The division of power between the empire on one side, and the individual States on the other, renders it difficult to describe the present German systems. The imperial penal code defines three grades of punishment, which differ from each other principally as to length of sentence. With respect to labor, it provides that convicts sentenced to confinement in penitentiaries shall be held to the employments introduced into those institutions. They can also be employed outside them, particularly on public works, or in labor superintended by a State functionary, but when so employed the prisoners must be kept separate from free laborers. A milder punishment is that for State prisoners whose sentences vary in length from one month to five years. They may be employed in ways suitable to their circumstances and capacities. Employment outside of the institution is only permissible with their (the officials') consent. The punishment of simple confinement for minor offenses carries with it no obligation to labor, altho work is to be provided the prisoner at his request.

These are the general regulations for the empire; the execution of the sentence is left entirely to the Governments of the separate States. In consequence, there is opportunity for the widest dissimilarity in the treatment of prisoners, and the man sentenced in Prussia may fare very differently from the prisoner who serves his time in one of the Thuringian States.

The public-account system (see CONVICT LABOR) occurs in Baden, Bremen, and, in part, in Bavaria, Wurtemberg, Oldenburg, and Mecklenburg, whereas the contract system prevails in the remaining States of the empire, of which Prussia and Saxony form the greater part. Now it is to be noted that the States contained in the first list are comparatively small, their total population being about one-fifth of that of the whole empire, and that they are geographically and politically separate from each other, while their prisons are all of moderate size, none of them exceeding 500 inmates in capacity, and are not situated in industrial centers. The contract system, on the other hand, is practised in Prussia, a State with 27,000,000 people, and where the bare figures of the prison statistics therefore appear very formidable.

But the whole number of convicts, in comparison with the mass of free laborers, is very small. If reckoned at 30,000 as a daily average in Prussia, it would still amount to less than 1 per cent. of the whole industrial population. This number, if employed in one industry alone, would prove very disastrous to the free workers engaged in it; but when the pressure is distributed through a variety of trades, it becomes almost imperceptible. And in Germany this is the case. In only one State, Bavaria, have complaints been heard that the prison labor embraced but few industries. Prussia has had since 1869 more than 35, and although the absolute figures of convicts employed are sometimes high, as, for instance, 2000 cigar-makers, the relative number to free laborers is by no means so unfavorable.

In 1832 there were a number of petitions praying for the abolition of convict labor. This was interpreted to mean the removal of competition from that source, and the discussion in the *Landtag* was conducted upon this basis. No new suggestions, however, were offered. The result of the discussion was purely negative, it being resolved that the complaints of the petitioners did not furnish subjects for further discussion, inasmuch as the Government sought continually to avoid a competition dangerous to free industry.

Since that time the subject has remained *status quo*. Evidently the feeling that the present system is a lasting one is by no means strong. There seem to be indications that the future will bring some new developments. The German Prison Society, composed of prison officials, adopted in 1830 a resolution to the effect that in principle the public-account system is the right and proper one.

ITALY.

Italy early developed the system of galleys. Of the galleys at Venice, which is perhaps a fair example, Howard writes (1784):

"One of the galleys [at Venice] was moored two boats' lengths from the shore, in which were only 27 slaves [convicts], who were kept here in order to be sent on board the other galleys. This was clean. Here, and in the other galleys, which were dirty and crowded, the slaves were in chains, of about 27 pounds' weight," etc.

Few countries however since this time have made more progress in, and given more attention to prison reform than Italy.

Dr. Wines (1880), gives the following information, regarding the modern administration of prisons in Italy, with special reference to industrial labor therein:

"The prison system of Italy embraces the following classes of prisons: 1. Prisons for preliminary detention and the punishment of minor offenses—number not stated; average number of inmates, 45,082. 2. Penitentiaries, with several subdivisions, of which the total number is 20, with an average population of 10,738. 3. The bagnios, or galleys, number 21, with a population of 15,148. 4. Correctional prisons for juvenile convicts, four, with 573 inmates. 5. Agricultural colonies, five. 6. One prison for invalids.

"The supreme authority in the penal administration of Italy is the minister of the interior. Under him . . . is the director-general of prisons.

"The end aimed at in the administration of penitentiary discipline in Italy is to so direct punishment that, without allowing it to lose its necessary characteristic of deterrence, it shall also possess the equally essential requisite of reforming the delinquents.

Methods.

. . . . On the one hand it is instilled into the mind of the prisoner that he will be enabled, by good conduct, to ameliorate his condition; on the other, it is sought to raise his sense of

Convict
Labor.

manly dignity that he may not become a hypocrite. In the penitentiaries those who distinguish themselves by good conduct enjoy special advantages. . . . In the bagnios there has been established a system of progressive classification, under which prisoners, like the mercury in a thermometer, ascend and descend according to their deserts. . . . Those prisoners who have distinguished themselves by good conduct in the penitentiaries, and have worked out at least one-half their time, are removed to the agricultural colonies of Pianosa and Gorgona.

"In the penitentiary system of Italy there is no labor bearing an exclusively penal character. It is sought to give to the industrial education of the prisoners the turn which seems best suited to them and to impart the trade most easily mastered. Labor has no other aim in the Italian prisons than to overcome the natural propensity to idleness in the criminal, to accustom him to a life of activity and hardship, and to give him the means of obtaining an honorable livelihood. . . .

"The colonies constitute, to all intents and purposes, the intermediate prison of the Crofton system in its best form. The labor, beyond that pertaining to the establishments, is wholly agricultural, being devoted to the culture of the vine, the olive, and the cereal grains. Agriculture is taught to the prisoners scientifically as well as practically. . . . Thus occupied, their minds are turned largely from evil thoughts. . . . They are brought, day by day, to look forward to a better future, and, through habit and the stimulus of gain (for they are allowed a liberal share in the product of their toil), they naturally acquire a love of labor. Physically they cannot but improve, for they have constant exercise in the open air." The Italian administration lays great stress upon the education of her criminals, particularly those of tender years. In each penitentiary there is a school, and the greatest possible number of inmates is admitted to it, the youngest having preference. Each prison has a library also. In the houses of detention and reformatories the course of instruction embraces a wide range of subjects, including music, agriculture, and a foreign language. A school for the professional education of prisonkeepers has been established at Rome—a sort of normal penitentiary college—having accommodations for between 200 and 300 inmates.

RUSSIA.

The history of Russia begins properly with the year 862, A. D., in which Rurik the Great, at the head of his Varangians, founded the empire in Novgorod.

For the first century and a half the empire was without a written code of laws, and it was not until about the year 1018 that Yaroslav framed the first code, and this was originally prepared for Novgorod alone.

Under the code of Yaroslav "perpetual slavery, extending to their posterity, was the lot of all prisoners of war and of all persons bought from foreigners; slavery for a limited period was the portion of those who sold themselves, of insolvent debtors, freemen who, without conditions, married a slave, servants out of employment, hired servants who did not fulfil their engagements, in a word, all the weak who made themselves the slaves of the strong to obtain subsistence and protection."

This bondage, however, whether perpetual or temporary, was not, except perhaps incidentally, the punishment of crime, but rather of misfortune.

The code of Yaroslav, tho amended and changed by various rulers, notably by Vladimir II., continued in force until the promulgation of that of Ivan III. (the Great), who reigned from 1462 to 1505. Of this new code, Ségur says:

"Single combat decides upon the majority of criminal offenses; in cases of suspicion, where reputation is not spotless, torture is called in to enlighten justice.

"The penalties of Ivan's code are confiscation, the knout, slavery, and death."

This code remained in force until about 1556, during the reign of Ivan the Terrible, when a new code was established. Under this, as well as under the earlier code of Yaroslav, fines were the punishment allotted for the majority of crimes. The code of Ivan the Terrible remained in force until the accession of Alexis, who reigned from 1645 to 1676. In 1650 he framed a new code which became known as the Ulagena.

This code continued the law until the reign of Peter the Great, who prepared new laws much more in accordance with the spirit and genius of European legislation (1720).

"In criminal cases he still employed torture, tho with mitigation. He punished various crimes by sending the guilty to labor on the public works or the

galleys. Those condemned to such punishment had their nostrils slit."

It is stated that in 1508 Boris Godunof commuted the sentences of all capital offenders to exile to Siberia, but as nothing is said about the terms of their banishment, it cannot be determined whether they were made to labor in the mines which were then being opened.

This was the beginning of the Siberian system. Under Elizabeth (1709-62) great numbers were sent to Siberia; under Catharine II., still more were sent, tho the visit of John Howard to Russia induced the empress to introduce some reforms. In 1877 a special commission was created to examine the draft of a new scale of punishments prepared by the ministry. The commission reported favorably upon the proposed scale of penalties in which "the death penalty is retained only in the case of crimes against the safety of the State and the person of the emperor. Properly speaking, therefore, banishment to Siberia, coupled with hard labor (*travaux forcés*), occupies the first place among Russian penalties. By the existing code this penalty is for life, or a maximum term of 20 years; by the draft (*projet*) of the commission it is for life, or a maximum term of 15 years.

"Moreover, the commission is in favor of the absolute abolishment of simple banishment to Siberia, that is, without the addition of hard labor; it would have this species of banishment replaced by imprisonment in some form."

"Deportation to Siberia, begun in 1501," M. de Grot says, "was principally used for political prisoners, insurgents, religious dissenters, and conspirators. Large numbers of Poles were exiled in 1758; others again in 1830; and now, since the nihilist movement, numbers of these implacable foes to the existing régime are regularly dispatched to Siberia. The total number deported varies from 17,000 to 20,000 per annum, but this includes wives and children who may elect to accompany the exiles. The sentences are of two kinds, (1) the loss of all rights and (2) the loss of particular rights. The first includes degradation, the rupture of the marriage tie, inability to sign legal documents, to hold property, or to give a bond. The exile must wear prison dress and have his head half-shaved. He may be flogged, and if murdered would not be much missed. After a lengthened period of probation in prison the exile becomes a colonist, and may work on his own account. Those sentenced to the loss of particular rights are only compelled to live in Siberia, where they may get their living as they can. Many, however, are condemned to spend a portion of their time in confinement, but without hard labor. The exiles are sent from all parts of the empire by rail or river to Ekaterinburg, and thence to Tiumen, whence they are distributed through Siberia. Those deprived of partial rights are generally located in western Siberia. Those deprived of all rights go on to eastern Siberia. The latter go by river generally to Tomsk; thence they walk to their ultimate resting place, which may be Irkutsk or Yakutsk or Tchita, or the island of Saghalien, and the journey may occupy months. Not long ago a party of convicts was dispatched by sea to the last-named destination, embarking at Odessa, and traveling through the Suez Canal and by the Pacific Ocean.

"There are several hundred prisons in Siberia. They are of three kinds: (1) the *etape*, which afford temporary lodgings for prisoners on the line of march; (2) the *prizhlynie*, where the detention is often for several months during the winter, or until the ice is broken up; and (3) the *ostrog*, the generic Russian name for a prison, which is the place of durance for all exiles not on their own resources. Few of the large prisons in Siberia were built for the purpose. They are converted buildings—old factories, distilleries, etc. They are all upon the associate principle, containing a number of large rooms to accommodate any number from 25 to 100. The great central prison near Irkutsk, called the Alexandreffsky, one of the most important in Siberia, generally holds from 1600 to 2000 prisoners, all under sentence of hard labor and awaiting transfer to the mines. Dr. Lansdell, who visited this prison in 1870, found the prisoners very short of work. Some were engaged in making cigarette papers, others in shoemaking and brick-making. The prison is a huge stone-built building, very different from the ordinary run of Siberian prisons, which are usually built of logs, calked with moss to keep out the cold. They are surrounded by a high wooden palisade. Each prison has its hospital, chapel, generally a schoolroom, and a few work-

Siberia.

shops. The prisoners themselves are not unkindly treated.

"At most of the stations there are local committees to watch over the welfare of the prisoners. This is an extension of the Imperial Society of St. Petersburg. . . . The committees supply books and visit the prisoners. They clothe and educate the prisoners' children and help their wives to employment. They also augment the prisoners' diet from funds obtained by subscription. The regulation rations of Siberian exiles seem very liberal.

"The Russian prisoner has nearly twice the amount of solid food that an English prisoner receives, and he is at liberty to add to his diet out of his own means, which the English prisoner is not. The prisoners are also supplied with ample clothing, if they have none of their own; those sentenced to deprivation of all rights being obliged to wear convict dress. The discipline of the prisons is now in accordance with European ideas. Prison offenses are punished by relegation to a solitary cell, a certain number of which exist at all the prisons. Diminutions of diet are also inflicted, and an obligation to wear irons if they are not already worn. All exiles wear leg-irons for a certain time. These are riveted on to the ankles, and caught by a chain which is carried suspended to a belt around the waist.

"The irons are worn for various periods—from 18 months to four and even eight years. Very heinous offenders, or those who have escaped frequently, are chained to a wheelbarrow, which they are obliged to pull about with them wherever they go. A more severe punishment, when confinement and irons fail, is birching with a rod, for the knout is now abolished. The rod consists of switches so small that three may be passed together into the muzzle of a musket. The punishment is described as not more severe than that inflicted at English public schools. There is another flagellator, however, called the *plet*, a whip of twisted hide, which is still retained at a few of the most distant Siberian prisons and only for the most incorrigible, on whom irons, the birch, and other punishments have had no effect. The costliness of deportation is enormous and the results it obtains doubtful. The slow colonization of this vast territory may follow eventually, but there are already great difficulties in finding employment for the mass of labor in the Government's hands. The mines of gold, silver, and coal are passing into private hands, and there are no other public works. Hence, part of the Russian criminals who would have gone to Siberia are detained in the large prisons in Russia, where they are employed in manufactories or in the labors of ordinary mechanics, or any out-door work, such as making brick, mending roads, and manufacturing salt. Nevertheless, recent visitors to Russian prisons, whether in Russia proper or in the heart of Siberia, describe the prisoners as generally idle."

THE UNITED STATES.

Most of the early voluntary settlers in America were men of a type seldom found in a convict's cell; but the British Government bountifully supplied any lack in this respect by sending over her superfluous convicts, and thus created for us a criminal class.

Beginning in 1610 by the shipment of 100 convicts to Virginia, England continued until about 1776, the practise of periodically sending the offscourings of her jails to the American colonies, despite the earnest and vigorous protests of our forefathers. These convicts were transported by the British Government for crimes committed in the mother country, and were sold to planters for terms of seven or fourteen years, after the expiration of which time they might become freemen and acquire all the rights of citizenship.

All through the history of the Colonies down to the time of their revolt they had a distinct convict class among them, undergoing the punishment of servile labor under sentence of the courts of the mother country.

After the year 1718 the business of transporting convicts was systematically conducted by the British Government, as many as 2000 convicts being annually sent to America for a number of years. The introduction of all these "jail-birds," as a matter of course, increased the necessity for prisons and punishments in the Colonies, and we find that many of the early colonial laws were framed to control and punish these "servant criminals," as they are termed in one of the Maryland statutes.

On November 2, 1643, Samuel Gorton and six others who held peculiar views of the religious and civil duties of individuals were convicted of blasphemy at

Boston, Mass., and were thereupon sentenced to be confined at hard labor in irons in as many different towns.

In October, 1656, a law was passed in the colony of Massachusetts Bay providing that Quakers coming into the colony be "forthwith committed to the house of correction, and at their entrance to be severely whipped, and by the master thereof to be kept constantly at work, and none suffered to converse or speak with them during the time of their imprisonment."

The laws agreed upon in England for the government of the colony of Pennsylvania (having been signed by the Governor and Provincial Council of the colony May 5, 1682) contained the following provision:

"Tenth. That all prisons shall be workhouses for felons, vagrants, and loose and idle persons; whereof one shall be in every county."

This law clearly indicates the intention of the founder of the colony of Pennsylvania to establish labor as a penalty for crime, but we find that, although these laws remained nominally in force, they were not immediately put into execution.

In Connecticut, in 1773, an act was passed establishing the "Newgate" as a permanent prison. This Newgate prison was, in reality, an old copper mine in the present town of East Granby, Conn., and was formerly known as the Simsbury copper mines, having been first worked by a company in 1709.

This prison is described as being a terrible place in the early days. A historian, speaking of it, says:

"The only entrance to it was by means of a ladder down a shaft which led to the caverns underground. There, in little pens of wood, from 30 to 100 culprits were immured, their feet made fast to iron bars and their necks chained to beams in the roof. . . . The Newgate prison was, perhaps, the worst in the country, yet in every county were jails such as would now be thought unfit places of habitation for the vilest and most loathsome of beasts."

In 1780 the Newgate was used for the confinement of criminals, who, it is said, were chiefly employed in making wrought nails. It was also used during the Revolutionary struggle for the confinement of Tory prisoners. It was not until 1790 that it was established as a State prison.

The Newgate continued to be used as a State prison until the erection of the new prison at Wethersfield in 1827. In 1802, however, new prison buildings were erected on the old site, and these included workshops for the employment of the convicts. The Wethersfield prison, which took the place of the Newgate, had productive labor in it from the time it was opened for the reception of convicts, but at that date enormous strides had been made in prison discipline in all the States, and the modern penitentiary system was an accomplished fact.

In Pennsylvania one of the earliest measures after the close of the Revolution was in the direction of reforming the penal code, and in 1786 an act was passed providing that certain crimes, which until then had been capitally punished, should thereafter be punished by labor, "publicly and disgracefully imposed."

Under this law the convicts were employed in cleaning streets, repairing roads, etc., their heads were shaved, and they were clothed in a coarse uniform.

The concurrent testimony of all, however, is to the effect that the result of this movement was to increase crime and to degrade the criminal, whose shame at this public exposure soon hardened into sullen resentment and impotent rage. The legislature, upon witnessing the disastrous effects of this system upon the criminal and upon society, attempted its reform with great vigor. "The acts of 1780, 1790, 1791, 1794, and 1795 prove the anxiety to correct mistakes and establish a system of punishments which should combine severity and certainty with humanity, and, by removing public disgrace and the temptations to excess, leave room for the possible entrance of reformation."

By the acts of April 22, 1794, and April 18, 1795, the system of solitary confinement at hard labor was established, which still, though modified by modern legislation, remains the basis of the present system. The present prisons of the Union may be classed into (1) State prisons, (2) district prisons, (3) county prisons, (4) municipal or city prisons. Each State, as a rule, has its own State prison, but Pennsylvania and Indiana have two and New York three. The cellular system, or the rule of continuous separation, was at first followed by several States, but gradually abandoned in favor of the so-called silent system, or that

Early Systems.

of labor in association under the rule of silence, with cellular separation at night. At the present time there is but one prison, the Eastern Penitentiary of Philadelphia, managed on the purely solitary plan.

Concerning the employment of the convicts there are four systems in vogue.

The contract system is the most prevalent in the United States at the present time. Under it more convicts are employed and more goods manufactured than under any other.

Present Systems.

In its practical working the prison officers, under legal instruction, usually advertise for bids for the employment of the convicts of their respective institutions, the highest responsible bidder securing the contract. The contractor commonly engages to employ a certain number of convicts at a certain price per day, the institution or the State furnishing power, and sometimes machinery, but rarely tools; the convicts to be employed, as a general thing, within the walls of the prison.

The advantages of the contract system are great, when pecuniary results are the chief ends sought. The returns or income constitute 65 per cent. of the running expenses, taking those institutions in the country that are run under this system purely. The contract system secures the constant employment of convicts, as the contractor engages to keep employed the number of prisoners specified in his contract.

It is usually claimed by those who believe the contract system is the best that can be adopted that sufficient reformatory efforts can be put forth under it. They claim that the contractor's men, instructors, and foremen are as thoroughly responsible to the State as if they were employees of the State. The chief advantages, in brief, however, are the constant employment of the convicts, the best remunerative results, and the avoidance of business risk on the part of the State.

The disadvantages of the contract system, as claimed by those who oppose it, and as shown to a greater or less extent by the facts brought out, are as numerous as the advantages, and more specific. In the nature of things, if the contract system results in securing a greater reward to the State than any other except the lease, the competition must be greater than under others, and this competition does exist to a large extent.

The simple fact that 67.8 per cent of the provision coverage used in Chicago is manufactured in prisons, by contractors who pay no rent, no insurance on buildings, and no taxes on realty, and hire men at from 45 to 62½ cents a day, renders every other fact here shown as to the decline of the business in Chicago, the falling off in the market price, the reduction of wages, and the consequent reduction of skilled coopers to the rank of day laborers inevitable without other demonstration.

If the competition is severe in any industry and in any locality, the contract system is, in so far, condemned. The material competition is aggravated by the moral aspect of the case. Working men feel aggrieved that contractors should be able to employ labor at a few cents per day, ranging perhaps from 20 to 60 cents for long-term men, and that the contractor, as an individual, should have the advantage, under the patronage of the State, of securing gains to himself. They feel that it is an affront to them, not only as wage-receivers, but as contributors to the general wealth through their producing capacity. (See CONVICT LABOR.)

The piece-price system is simply a modification of the contract system, the contractor having nothing whatever to do with the convicts. Under the terms of the contract he agrees to furnish the prison officers with material ready for manufacturing, and the prison officers agree to return the completed work, for which the Government receives a certain agreed price per piece. The advantages of this system are that the contractor's men have no position in the prison, and every effort for reformation is left untrammelled by outside influences. This system, in a large degree, satisfies the prison reformer, but does not satisfy the manufacturers and working men themselves; for while no aggravation arises on account of wages per day, whatever competition grows out of the contract system, so far as sales and the price of goods in the market are concerned, results from the piece-price plan. Its chief advantage is that it removes the objection against the ordinary contract system as regards reformatory efforts. Its disadvantages otherwise are quite as prominent as in the old system.

The report of the Labor Bureau calls the public-account system the ideal system of prison reformers, working men, manufacturers, and legislators, as a rule. The advantages claimed for it are, that whatever profit is made in labor and in sales goes to the State; that no individual secures any advantages in the production of goods not accorded to all manufacturers, and that the convict works under it with better spirit, because he knows his labor is for the State which he has offended, and not for the pecuniary benefit of any single individual or concern. The penologist likes it because prisons are placed under State control entirely and all the foremen and instructors are officers of the State. The State socialist advocates this system because it gives an instance of the State's management of industries, and adds, if successful, an argument to his claim that all industries and business enterprises should be conducted by the State. The system offers the best opportunities for reformatory efforts.

The Public-account System.

To be successful, or partially so, financially, the public-account system must be carried on with power machinery as an adjunct of the labor of the convicts, the same as in the contract system. The results pecuniarily, wherever the system is in vogue, are quite satisfactory to its adherents, and, as has been shown, its labor income meets 32 per cent. of the running expenses of those institutions carried on under it. The chief advantage of the system is that the price of free labor is not affected.

The disadvantages of the public-account system, especially when power machinery is employed, are great. It is claimed by those who oppose the system that it is impossible to secure men efficient as wardens and at the same time efficient as practical manufacturers, and that, as the industries of a prison conducted on the public-account system are diversified, as it is usually claimed that they should be, the difficulty grows greater and greater. Perhaps the greatest disadvantage of the system, however, is that it competes or can compete with honest labor more than any other system. The State can, if it choose, sell without making any profit whatever.

Another great disadvantage growing out of the adoption of the public-account system is that prisoners would have to be laid off in dull times, or else the prison accumulate its goods. If the constant employment of convicts is essential to their well-being, this system does not provide it.

The scandals which have arisen in some States in the past under the public-account system, through the maladministration of wardens in a business way, ought not, however, to be used as an argument against the system, because the State Government conducting the prisons should be responsible for the employment of men of integrity.

The old lease system of employing convicts consists in the State leasing all convicts or a certain number to a lessee or contractor for a round sum to be paid, the lessee meeting all expenses of management, care, protection, guarding, etc., connected with the employment of the prisoners. If a State should lease all who may be convicted of crime to a contractor under this system for \$200,000 per annum, this practically ends the interest

The Lease System.

of the State, and it secures a profit of \$200,000, less perhaps the salary of a superintendent, and one or two other officials, it being at no expense to maintain a prison in any form, the contractor employing the convicts within the State in any way he sees fit, so long as he conforms to law and the terms of his contract. The great advantage of the system, therefore, lies in the fact that the State has no care beyond the receipt of the amount stated in the lease. This system, therefore, is the most remunerative of any in vogue, its proceeds constituting 72 per cent., taking all States together that work under the system, of its running expenses. Its advocates are few. They claim that the system, in the States where adopted, is the best for the class of persons as a rule coming under it, they being mostly men used to outdoor life, and as this system prevails largely in the warmer portions of the country, the prisoners can be kept in stockades and open prisons, with better results as to health and comfort than could be reached for the same class within prison walls, as is the rule in the Northern States. This may be temporarily true, but the disadvantages of the system are so great that the advantages are overshadowed. The contractor or lessee becomes the agent of the most active competition. He may secure

the labor of a thousand prisoners for a year for the sum of \$20,000, this expense to him being increased by the cost of maintenance, etc.; in some cases the expense of guarding alone becomes enormous, so much so that perhaps the escape of a prisoner or his death is cheaper than the expense of guarding him. This, however, is the exception. Fortunately for free labor, the lease system is employed in localities where but little competition arises; but this advantage grows less and less as the mechanical industries of the States where it prevails become more thoroughly developed, and as the recent strikes against this terrible system have shown.

EVILS.

Concerning the evils of the present penal systems of the United States, Governor Altgeld says in his *Live Questions*, from which we largely quote in this portion of our article (p. 308):

"No man can examine the great penal system of this country without being astounded at its magnitude, its cost, and its unsatisfactory results. There are in the United States upward of 2200 county jails, several hundred lock-ups, or police stations, between 50 and 60 penitentiaries, with workshops, machinery, etc. The first cost of the erection of all these buildings and shops has been estimated at upward of \$500,000,000, which is dead capital—the interest, at 5 per cent., upon which sum alone would annually amount to \$25,000,000. To this must be added the sums annually appropriated out of the treasury to feed the prisoners, pay the officers, judicial and executive, and keep up and maintain all these institutions, which sums have been estimated at upward of \$50,000,000, to say nothing of the costs paid by the accused; there are, in addition to the many thousands of policemen and detectives, about 70,000 constables in this country, and about as many magistrates. There are upward of 2200 sheriffs, and in the neighborhood of 12,000 deputy-sheriffs. Then come the grand juries, petit juries, judges, and lawyers; next the keepers and their numerous assistants for all these prisons. On the whole, there are about a million of men partly or wholly supporting themselves and their families from this source."

Among the charges that Governor Altgeld brings against the present prison system are: *First*, that many are imprisoned, before trial and after, and thus brought into contact with the criminal atmosphere, who ought not to have been imprisoned at all, and who, had they been differently treated, might have made good citizens.

He says (*idem*, p. 268):

"Young men and boys, and even girls, accused of violating some city ordinance are treated by the police and the police magistrates, in the first instance, in the same manner as the hardened criminal. They are arrested, not infrequently clubbed, sometimes handcuffed, marched through the streets in charge of an officer to the station, which in many cases is worse than a jail, where a full description of each is written down opposite their respective names, and then they are required to give bail for their appearance at some time in the future when the magistrate can hear their case. If they cannot furnish the bond instantly—and generally they cannot—they are shoved into a cell, and frequently occupy the same cell for a night, and sometimes for a week, with the most desperate of criminals. The station-keeper is not to blame for this, for the law has made no other provision and left no alternative but to lock them up.

"Attend a session of the police court in any of our large cities, on almost any morning, and you will see on the sawdust in the prisoners' pen a miscellaneous crowd of human beings of both sexes, ranging from middle life down to tender years, nearly all from the less fortunate class in life—poor, more or less ragged, with misery stamped deep into their faces, weak, with little or no training, no steady habits, without homes worthy of the name, and raised in an atmosphere destitute of good and pregnant with vicious influences. As their cases are called, you learn that about one out of twelve is charged with a serious offense, about five-twelfths are charged with minor offenses, but there is something about the appearance of the accused which tells you they have made this round before. The remaining half are also charged with minor offenses, such as drunkenness, disorderliness, etc., but you soon become satisfied that they are not yet thoroughly depraved; that while they may have violated some ordinance, they yet have the stuff in them to make good citizens, if given a little better chance; and, as you look at them, the conviction settles in your mind that it was unnecessary, and therefore wrong, to

drag them in and corral them like so many cattle, and that neither they nor anybody else will be benefited by such treatment. If you ask the magistrate why they were thus treated, before they had even been tried to see if they were guilty, he will tell you that the law required this; that under the law no other course was open.

"You sit down while their cases are heard, and to your surprise find that about one-third are discharged by the magistrate because the evidence fails to show that they were guilty of any offense whatever. (The police reports show that nearly one-third of all that are arrested are discharged by the magistrate.) Turning then to those not discharged, you find that a few, being shown to be probably guilty of the graver offenses, are bound over for the action of the grand jury, while the great majority are shown to have violated some ordinance, and are fined; and as the fines are not paid at once in many cases, you see men, women, and often children, crowded into an omnibus with iron grating at windows and door, and driven to the workhouse or to the bridewell (which may properly be called a short-term penitentiary) to work out the fine, or, in the absence of a workhouse, they are led back to jail to serve out the fine at so much a day."

In Chicago in 1887, of 32,800 arrested, 10,743 were discharged by the police magistrates, to say nothing of those that were bound over to the grand jury and then discharged. Thus, during one year, there were in that one city upward of 10,000 young persons, who, without having committed any crime, were yet condemned to undergo a regular criminal experience.

Second. The charge is made that present prison systems do not distinguish between convicts who are guilty, but bundle together the hardened and those who have committed their first offense.

Every case has to go through the same steps, no matter how much the circumstances may differ; the proceedings must be the same, no matter how trifling the charge; the accused must be *arrested*, must be either *given bond* or be *locked up* until he can be tried and the fact ascertained whether he is even guilty of the trifling offense charged or not, and, if found guilty, then, no matter what the condition of the accused may be, whether old or young, vicious or merely weak, male or female, there is but one course open, and this for all alike; that is, to impose a fine, and, if this is not paid, to send the accused to the jail or to the bridewell.

In the Fifth Biennial Report of the Michigan State Board of Corrections and Charities, 1879-80, the subject of "Inequality of Sentences" is thus considered:

"In Michigan, during the year ending September 30, 1877, there were eight convicts sent to the State prison for assault with intent to commit murder—one for 45 years, one for 25 years, one for 15 years, one for 9 years, one for 6 years, one for 5 years, one for 2 years, and one for 1 year.

"It is supposable that these eight men, so sentenced for the same technical offense, may have been seen in prison working in the same department, eating at the same table, listening to the same prayers in the chapel, with occasional opportunities for surreptitious exchange of notes as to their respective allotments of justice and their progress in reformation.

"This inequality of sentences runs through all the courts. Cases like this (an actual case) occur somewhere in the United States every month in the year. At the same term of the court, a bank-teller, for a theft of \$500 from his employers or from a customer, is released on a nominal or suspended sentence, while a boy of 17 is sentenced to prison for three years for stealing a second-hand suit of clothes worth less than \$20."

Mr. H. M. Boies says (*Prisoners and Paupers*, p. 6): "Our jails are conducted as public schools of crime and nurseries of criminals. Into them our constabulary and courts hustle ravishers, sodomites, corrupters of youth, murderers, burglars, thieves, drunkards, prostitutes, and all the foul members of society they can lay hands upon, with children convicted of petty larcenies or of incorrigibility, with detained witness's and people accused of misdemeanors or crimes not tried. Inside the walls, comfortably housed, clothed, and fed, supplied with tobacco and cards, with promiscuous intercourse permitted during a part, if not all the day, the professional criminal and the hardened sinner recount their adventures to an interested audience, and delight to initiate the more ignorant into all the mysteries of iniquity. Incarcera-

Indiscriminate Treatment.

tion here has no deterrent dread for the 'rounder,' while the erring one, confined for a first assault, soon becomes assimilated to his companions, and joins the ranks of crime. Except for the brief period that the victims are restrained of their freedom of action, our jails are a menace rather than protection to society."

Third. It is said that the pole-star of the present system is *punishment*, whereas the protection of society should be its sole object, and as punishment never made a sincere convert, and as the multitude of first offenders comes from the weaker class, they should be treated rather as *wards*, whom it may be necessary to confine, but whom it is yet necessary to train and educate, if possible, into good citizens.

Governor Altgeld says (*Live Questions*, p. 190):

"In October, 1870, there was held at Cincinnati, O., a National Prison Reform Convention. The convention was composed of several hundred members from all parts of the Union, and was presided over by the Governor of Ohio. Being largely made up of persons familiar with the practical management of prisons and deeply interested in the subject of prison reform, its proceedings were distinguished for marked ability. As a result of its deliberations, it formulated and adopted, with almost entire unanimity, a declaration of principles, 37 in number, of which the *sixth* is so apposite to the point now under consideration that I give a part of it here:

"It is essential to a reformatory prison treatment that the self-respect of the prisoner should be cultivated to the utmost extent, and that every effort be made to give back to him his manhood. Hence, all disciplinary punishment that inflicts unnecessary pain or humiliation should be abolished as of evil influence. . . . There is no greater mistake in the whole compass of penal discipline than its studied imposition of degradation as a part of punishment. Such imposition destroys every better impulse and aspiration; it crushes the weak, irritates the strong, and indisposes all to submission and reform. It is trampling where we ought to raise, and is therefore as unchristian in principle as it is unwise in policy."

Mr. Wines, in his work on prisons, says (p. 201) concerning the cruel treatment of prisoners:

"Cruel treatment was once generally esteemed the most sure, just, and only fitting method of penal discipline. But the period is well passed when the interior of a prison is to be the arena for the exercise of brutalizing forces upon erring and wicked men. The thought and action of the present have emerged from the dark shadows of the last century. Surely, all means of penal control which are severally restrictive of the mental, moral, and physical good of the convicted criminal, and manifestly tyrannical, simply because an opportunity is afforded or created, do not conserve the high purpose of calm, helpful justice. The government which works out the best results for its subject secures therefrom something more than a machine-like obedience. Submission to rules, and the concurrence in an enforced task, which are not beyond reason, can be secured in the vast majority of cases, in well-regulated prisons, by means which are at hand and which are far removed from cruelty. In so doing, the prisoner's self-control is evoked, and habits of industry acquired, which can never be brought about by the crushing process so much lauded by conceited and inexperienced prison reformers."

Florian J. Ries, inspector of the house of correction of Milwaukee, in the management of which he achieved a signal success, says, in his report for 1880:

"The subject of reforming convicts is one that ought to be entitled to the very first consideration in the management of a prison. The idea that a prison is solely an institution for the *punishment* of violators of the law is fast becoming obsolete, and one more humane, and in keeping with our advanced civilization, is taking its place. Experience has taught, and humanity demands, that the discipline of a prison be directed more toward the moral improvement of its inmates than to punishment or to torture."

Fourth. The charge is made that at present our prisons do not, as a rule, reform the prisoners, but turn them loose, at the expiration of sentence, in a condition which soon returns a great per cent. of them to prison.

Says Governor Altgeld (*idem*, p. 170):

"In the Milwaukee House of Correction there were committed, during the year ending December 31, 1881, 1420 prisoners; of these 58.52 per cent. were committed

for the first time, while 41.48 per cent., or less than half, had been imprisoned before.

"During the year 1882 there were committed in the Chicago House of Correction, or bridewell, 7566 prisoners; of these, 3923, or a little over half, admitted that they had been imprisoned before.

"These two institutions may be taken as showing the average of recommitments in similar institutions throughout the country, which may be set down as 50 per cent.; that is, one-half of all imprisoned admit that they have been in prison before.

"But it must be remembered that all those imprisoned because of inability to pay a fine imposed by some police magistrate, as well as those convicted of the smaller offenses only, are sent to these institutions; hence, the average of recommitments is much higher than in the other prisons.

"For example, in the Illinois penitentiary at Joliet there were committed, during the year ending September 30, 1882, 7477 convicts. Of these, 121, or 16.20 per cent. admitted that they had been imprisoned in the penitentiary before. In some years the average is higher. It varies a little in all the penitentiaries, but in many it is 25 per cent.; and if we include the Southern States, where negroes are frequently recommitment for rather trivial offenses, it will average 30 per cent. No doubt a great many are recommitment without the knowledge of the prison officers, and consequently the number of recommitments really exceeds the above estimate."

Arthur McDonald (*Criminology*, p. 157) states the recedivists (relapsed criminals) condemned by court, to have been in Italy, in 1882, 22 per cent.; in France, in 1879, 50 per cent.; in Belgium, in 1869-71, 70 per cent.; in Prussia, from 1871 to 1877, from 74 to 84 per cent. In France, of 1000 recedivists, 67 were under 16 years of age; 204 were between 16 and 21; 284, between 21 and 30; 215, between 30 and 40; 206, between 40 and 60; 24 over 60.

Fifth. Governor Altgeld asserts that there are special evils concerning the arrest of women. He says (*idem*):

"It appears from the report of the Superintendent of Police of Chicago that, in 1882, 6835 women were arrested and taken to the police prisons in Chicago, and that, during that year, 1800 women were incarcerated in the Chicago House of Correction, mostly for non-payment of fines which had been imposed. Of the latter number, 359 were reported prostitutes, 871 were servants, 114 were laundresses, and all were poor. Now, can any good come of thus treating unfortunate women? What are they to do when released? Can anybody tell? The 359 whom the officers call prostitutes, and think that a sufficient accusation to excuse any kind of treatment, were not the pe ted children of sin—not those that live in gilded palaces and dress in silks and satins, for these are rarely disturbed—they were the poor, unfortunate, and forlorn creatures who, without friends, without sympathy, without money, often hungry, and without sufficient clothing to protect them from the cold winds, wander out on the streets, not so much wantonly as from necessity, literally trying to sell their souls for a morsel of bread, dealing in shame, not from choice, but because every Christian door is shut against them, because there is no place where they can work and find shelter. Now, in what condition are they when they have gone through the above experience? What are they to do when again set at liberty? Experience has answered this a hundred times. They return to their old ways, because there is nothing else that they can do; the only difference being that they have become more degraded, more brutalized by the treatment which they have received, and from which no good ever has or ever can come."

Sixth. Concerning the evil effect of convict labor upon free labor, see CONVICT LABOR. But there are evil effects, as the system is at present usually managed, upon the convict himself. Says Governor Altgeld:

"A convict has no interest whatever in his work. It does him no good to do a large amount of work in a day, for it will benefit neither him nor anyone dear to him. Men are generally impelled to work by a desire to benefit themselves or those dependent upon or dear to them. But the convict has none of these incentives. The convict's work is to him a treadmill from which he is to get no benefit. He goes to his task because forced to go; works only while forced.

"The effect is, therefore, to make a man a slow workman, and, in many cases, an indifferent and

Women Prisoners.

careless one; and in time these habits will become natural, especially where they are long continued. Therefore, instead of becoming an expert and skilled workman, he is more apt to become a slow botcher, and is therefore not well equipped to make an honest living when he goes free. Nobody wants him, and he soon relapses into crime."

In 1872 Mr. Tallack, at the request of the Howard Association and of the Central Committee of the International Prison Congress, collected a vast amount of information on the subject of prison management, prison labor, and the reformation of prisoners. On this point he says: "Prisoners, if discharged untaught and untrained, soon relapse, and cost the public £150 per annum (nearly \$800), at a low estimate, by their robberies."

When a man has spent years in prison, on again going out into the world he is absolutely dependent; he has no money and generally no friends who will help him; he may be anxious to work and earn an honest living, but often cannot get work.

Florien J. Ries, in his report of the Milwaukee House of Correction for 1880, in speaking of this subject, says:

"Many, doubtless, leave the prison with a strong determination to lead honorable lives in the future; but here the question arises, How will they accomplish this? With all boasted philanthropy and all pretended kindly feeling toward these persons, how does society meet them when the prison door has closed behind them? As long as people demand that prisons must be self-sustaining, these persons will receive but a pittance upon their discharge. With this they venture out upon the world, seeking employment; and, if they are frank, and admit that they have just been discharged from prison, who will employ them? Without employment, without money, without friends, what are they to do? Is it not perfectly natural, under these circumstances, that they should seek and find their former associates in crime?"

REFORMS PROPOSED.

The reforms proposed for these and other evils are numerous.

First. It is proposed that for light offenses adults, and especially the young, should not be imprisoned at all, but placed on probation under a probation officer. This has been tried in Boston some 15 years. A law providing for this was passed in 1873. Having provided for the appointment of probation officers—one in each district—and for the manner in which notice shall be given them of every arrest, the law says:

"SECTION 75. Such probation officer shall carefully inquire into the character and offense of every person arrested for crime in his city or town, for the purpose of ascertaining whether the accused may reasonably be expected to reform without punishment, and shall keep a full record of the results of his investigations.

Probation Officers.

"SECTION 76. Such probation officer, if satisfied, upon investigation, that the best interests of the public and of the accused would be subserved by placing him upon probation, shall recommend the same to the court trying the case, and the court may permit the accused to be placed upon probation, upon such terms as it may deem best, having regard to his reformation. [When probation is recommended by the officer, the prisoner is practically released on his own bond.]

"SECTION 78. He shall attend the sessions of the courts held within said county for criminal business, investigate the cases of persons accused or convicted of crimes and misdemeanors, and recommend to the courts the placing on probation of such persons as may reasonably be expected to reform without punishment. He shall have a place in the office of the superintendent of police. When he deems it advisable for any person placed on probation to be sent out of the State at the expense of the city, the city council may make the necessary appropriation for the purpose, to be expended by him, under the direction of the superintendent of police, and he shall render an account of such expenditures, with the items, quarterly, to said superintendent. He shall also, as far as practicable, visit the offenders placed on probation by the court, at his suggestion, and render such assistance and encouragement as will tend to prevent their again offending. Any person placed upon probation, upon his recommendation, may be rearrested by him, upon approval of the superintendent of police, without

further warrant, and again brought before the court; and the court may thereupon proceed to sentence, or may make any other lawful disposition of the case."

A summary of the first 10 years' experience is as follows:

	1879	1880	1881	1882	1883	1884	1885	1886	1887	1888
Whole number taken on probation...	430	376	418	549	788	846	707	852	827	1056
Did well and were discharged.....	375	335	377	489	718	757	742	790	784	992
Proved incorrigible	55	41	41	60	70	89	55	62	43	64

Had there been no probation, all those that were saved must have been sentenced and imprisoned, and their sentences during the 10 years, when put together, would have amounted to 1715 years and 10 months, or an average of 171 years and 7 months of time each year, all this having been saved to the accused and their families, as well as to society.

Mr. William F. Reed, probation officer for the Roxbury district, closes his report for the year 1888 as follows: "*Probation has saved many of both sexes from exposure, shame, and loss of situation, in cases where they had committed their first offense, and not only saved them for the time being, but for all times.*"

The method of procedure is simply to continue a case for three months, and then to continue it again as often as may be deemed necessary. If the accused does well, he is finally discharged. If he does not do well, he can be sentenced at any time.

It is a most remarkable circumstance that so few run away. Out of 1056 placed on probation in one district in one year, only 12 ran away, and, on the whole, the average of runaways is scarcely 1 1/2 per cent.

Second. It is proposed that when men are imprisoned, they be imprisoned on the "indeterminate sentence."

In the report of the Committee on Prisons, made in 1881, to the Legislature of California, with some reflections on prison discipline and management, the question of "indeterminate sentences" is thus discussed:

"By indeterminate sentences is meant that all persons in a State who are convicted of crimes or offenses before a competent court shall be deemed wards of the State, and shall be committed to a Board of Guardians, until, in their judgment, they may be returned to society with ordinary safety and in accord with their own highest welfare. If this principle be adopted, the confinement of a prisoner will depend upon his own exertions to earn promotion and eventual freedom. The duration of confinement is placed under the control, and is determined by the conduct, of the convict himself. The advantages of an indeterminate sentence are:

"Indeterminate Sentence."

"1. It supplants the law of force by the law of love.
 "2. It secures certainty of restraint and continued treatment, which operate to prevent crime, as severity does not.

"3. It makes possible the arrest and right training of that whole brood of beginners, before great depravity is reached and character is irretrievably fixed.

"4. It utilizes for reformatory ends the motive that is always the strongest—the desire to be released, the love of liberty.

"5. It removes the occasion, and so mollifies the feeling of animosity usually felt toward the law and its officers, puts the personal interest of the prisoner plainly in obedience to the rules of discipline, and leads him to co-operate with those laboring for his welfare."

The classical example of the working of this system is the Elmira Reformatory (*q. z.*), where the results are so astonishing that we devote to it a special article.

The Tenth Annual Report of the Commissioners of Prisons of Massachusetts, January, 1887, says:

"Whatever plan may be adopted to afford the best opportunities for accomplishing the reformation of criminals, the highest results can never be attained while the present system of imposing definite sentences for crime is in force. This was long ago recognized as true in the treatment of young offenders, and for many years children have been sentenced to the reform schools for their minority, no time-sentences being imposed; the power to release them, when they are deemed to be reformed, being given to the authorities in charge of the schools.

"There are many reasons for applying the same principle in the treatment of adult criminals. The present system holds out no inducement to the convict to reform. His sentence is a fixed one, and expires on a day certain, regardless of his conduct or of his character. The one thing he keeps more constantly in mind than any other is the day of his release. He knows that this will not be much delayed by anything he may do, and cannot be materially hastened by good behavior or by any change of character. He learns to look upon his punishment as wholly retributive; and, when he comes out of the prison, he feels that he has 'wiped out' the record against him, and is to begin again. During his trial, his main effort, and that of his counsel, is to secure as light a sentence as is possible, and often, with no conception of the gravity of his offense, he harbors a spite against the Government for punishing him too severely.

"It may be necessary to continue for the present this system for most offenders, as a change from fixed sentences to indefinite ones involves a change in the whole system of prison management and discipline. But for an institution whose first aim is the reformation of criminals, indefinite sentences must eventually prevail. Under such a system, a convict would be confined until he was deemed to be reformed, be it a short or long time. This throws around the prisoner every possible inducement for self-improvement. He realizes that his future is in his own hands. He sees that the State is not punishing him arbitrarily for his crimes, but is interested in his welfare; that he is deprived of his liberty not so much on account of his *acts* as on account of his *character*; and that his right to freedom is dependent upon his reformation, which in turn depends upon his own use of his opportunities."

Third. It is proposed that convicts be paid for their work. Governor Altgeld says of this plan:

"There should, in my judgment, be given every convict in prison an opportunity to earn something over and above the cost of keeping him.

Paying Convicts.

I know this involves difficulties, but none that cannot be overcome. He should be not only permitted to earn something, but he should be required to earn something to carry to his credit before he is again set at liberty; so that, when he leaves the prison doors, he will have something to sustain him for a while; and this should not be paid him at once, but in instalments, so that he cannot lose it at once; or, if he has a family to support, he not only should be permitted to work, but required to earn something, while in prison, for the support of his family.

"Under the present system, the innocent are punished with the guilty. The law intends that its penalties shall fall only on those that actually violate it; but at present, in many cases, the consequences of a conviction fall with equal severity upon the innocent and dependent, for it in effect takes away their bread."

Upon this subject W. Searles, chaplain of the penitentiary at Auburn, N. Y., in his report, says:

"The letters received by the prisoners from their almost broken-hearted wives, mothers, sisters, and friends, enjoining upon them repentance, reformation, and obedience to the prison rules, that they may the sooner be reunited, must have a great influence upon them, both for their present and future good. And, sir, it is the perusal of these letters from the poor old mother, the broken-hearted wife, the suffering children, the grieving brothers and sisters, that enforces upon my mind the lesson that no man liveth to himself alone. In the vast majority of cases, these mothers, wives, and children are poor, and were dependent upon the son, the husband, and the father for the actual necessities of life. In consequence of his imprisonment they must suffer. While it is the duty of society to protect itself against the inroads of the criminals, let me inquire, is it not equally the duty of society to protect from want and suffering the innocent wife and child? As I have heretofore suggested, permit me again to express the hope that the incoming Legislature will make some provision by which a *portion, however small, of the convict's earnings may be set apart for his own or his family's benefit.*"

This system, therefore, works a great injustice to the innocent, and, in the long run, entails a heavy burden on society; for where the family of a convict is left without support, the burden of providing falls directly on society. It is immaterial whether this burden be discharged in taxes or in charity, or in the loss of goods stolen: it still comes from the public.

Further than this, the children of a convict thus situated, having no regular source to look to for bread,

are liable to grow up violators of the law from the sheer force of their surroundings; for squalor and misery are hot-beds of crime.

There has been some experience in this line.

In Minnesota the convict in the State prison is allowed, for good conduct, six days every month, for which he receives the same rate that is paid by the contractors of the State. The money thus earned may be paid by the prison authorities to the convict's family, if needy, and when not thus paid, it is given to the convict on being discharged. Many convicts, on leaving the prison, have had upward of \$150 to their credit, with which to start again in life. Are these not more likely to do well than if they had not a cent?

In 1876 Mr. Richard Vaux, President of the Board of Directors of the Eastern Penitentiary of Pennsylvania—one of the very best institutions of the kind in this country—in speaking of the work done there, said:

"Manufacturing material is bought at market prices, and the goods manufactured are sold at the same; so that there is no unfair competition with manufacturers who employ honest men. The convicts are allowed pay for overtime. *One man supported a wife and family outside of prison by overwork done in prison.* The prisoners cost about 34 cents a day *per capita*. Labor is not farmed out, nor let out by contract. We are not self-supporting, and I trust we never shall be. When a prison becomes self-supporting, it is just what prisons are not intended to do."

William Kunz, superintendent of the St. Louis workhouse, says:

"By carefully studying the habits and inclinations of the prisoners, I arrived at the conclusion that a greater amount of work could be obtained from them by offering a reward to the industrious prisoners than by exacting work from them under the threat of punishment. With the consent of the Board of Public Improvements, and the approval of his Honor the Mayor, I established task-work for all such labor as the possibilities would allow, whereby a prisoner inclined to be industrious has the opportunity afforded him of materially shortening his imprisonment by making overtime. Of this a great many prisoners have availed themselves."

It is not wholly a new principle. Wines, in his historical studies of prisons, says:

"Viscount Vilan XIV. was the founder of the Great Central Convict Prison at Ghent. . . . We find at Ghent, already applied, nearly all the great principles which the world is, even to-day, but slowly and painfully seeking to introduce into prison management. What are they? Reformation as a primary end to be kept in view; hope as the great regenerative force; industrial labor as another of the vital forces to the same end; education, religious and literary, as a third essential agency; abbreviation of sentence and *participation in earnings* as incentives to diligence, obedience, and self-improvement; the enlistment of the will of the criminal," etc. Again he says: "Among the most remarkable of the early experiments in prison discipline was that of Colonel Montesino, the prisoner to choose the trade he would learn."

Experience.

"He seized those great principles which the Creator has impressed upon the human soul, and molded them to his purpose. He aimed to develop manhood, not to crush it; to gain the will, not simply to coerce the body. He employed the law of love, and found it the most powerful of all laws. . . . *He excited the prisoners to diligence by allowing them a by no means inconsiderable portion of their earnings.* He enabled them to raise their position, step by step, by their own industry and good conduct. . . . Mr. Hoskins, an intelligent English traveler, after giving an extended account of the prison, adds this conclusion: 'The success attending the reformation of the prisoners in this establishment seems really a miracle.'"

Wines also records one other remarkable case, and that in a country where it was least to be expected—Russia. It appears that Count Sollowub introduced a system into the house of correction at Moscow, similar in its general features to that last described. So long as a convict remained an apprentice he got no part of the product of his labor; but as soon as he was adjudged to be a master-workman, he received a proportion equal to two-thirds of his entire earnings, the greater part of which was reserved for him as a little capital to begin life with again after his liberation. So effectual was the power of hope thus applied, that in some instances the convict apprentices

learned their trade and became master-workmen in two months. Nine-tenths of all learned their trade so thoroughly that, on their release, they could fill the position of foreman in other shops. And further, there were scarce any relapses; so that of 2128 persons released during the first six years, only 9 were returned to prison."

Of one objection to this plan, Governor Altgeld says:

"If it is objected that there would then be too much prison labor performed, by which free labor would be injured, I answer that, in the first place, there would be no more men at work than there would be, or at least should be at work, if there were no prisons; and, as the prison labor is no cheaper than the free labor, no injustice would be done to the free laborer. In fact, one great cause of complaint that now exists—viz., the cheapness of prison labor—would be done away with."

Fourth. It is even proposed that convicts be employed at remunerative labor outside of prison walls.

It is said that while the vicious, and those that have long terms to serve, are kept within the walls, the remainder could more generally be set at work for which they were adapted, outside of the prison. Instead of being confined to the few trades that can be successfully carried on inside prison walls, prisoners could then be set at almost every kind of manual labor; and, instead of employing them in a few branches of industry, as is now done, they could be distributed more nearly as they would have been had each selected work from choice as a free man.

Fifth. Some prison reformers fear too much indulgence and "coddling" of prisoners. Said Captain E. S. Wright, of the Western State Penitentiary, Allegheny, Pa., at the meeting of the National Prison Association, in 1892:

"It is generally understood that the prisons of Great Britain and Ireland are steadily diminishing in population, but the causes for this remarkable result are not clear to all. The credit should be given to a system adopted about 15 years ago, placing all the prisons under a centralized control for each country, with exactly the same rules and regulations governing control, labor, food, and clothing. Every item seems to be cared for, and the discipline is rigid and stern. It is the general belief that serious crime has diminished, but it is apparent that the vast number of petty offenders and habitual criminals has created much uneasiness, and severer treatment for such seems probable, as it is thought to be the only satisfactory solution of the matter. There is a feeling of distrust that the prevailing system of leniency in Great Britain, for minor crimes especially, has been a great mistake. Over a million of arrests are reported for 1891; of these 255,314 were committed to prison, but, as many were repeated crimes, in the same year only 137,000 persons were committed. Of these 12,380 are reported as felons and 10,100 as habitual petty offenders. This class, it is claimed, is a menace to society. Earnest men say, 'Why hesitate to seclude a class defined as a constant danger to civilized life?'"

"The history of American prisons shows constant progress in the treatment, and clemency has marked the course of justice; yet it has to be admitted that crime and vice have increased in greater ratio than the population of the country. We are, then, brought to this conclusion, that prison discipline must be placed on sterner and more repressive lines to be deterrent."

Sixth. Mr. Henry M. Boies advocates a measure quite different from any yet mentioned. He says (*Prisoners and Paupers*, p. 260):

"By carefully providing for its degenerates and abnormals in comfortable prisons, asylums, and almshouses, giving them the advantages of the highest knowledge and science of living, society unwittingly aggravates the evil it seeks to alleviate. It maintains alive those who would perish without its aid. It permits their reproduction and multiplication. It fosters, with more attention than it gives its better types, the establishment and increase of an abnormal and defective class. It not only perpetuates by care, but encourages, by permitting unrestricted 'breeding in' among them, the unnatural spread and growth of a social gangrene of fatal tendencies. It is assuming oppressive and alarming proportions, which begin to be felt in the whole social organization. In terror our advancing civilization begins to inquire if there be no way of counteraction consistent with its highest benevolence, by which this abnormality of abnormalism may be

Castration.

avoided, criminality and pauperism restored to natural proportions, or to that ratio of increase which may be the inevitable result of ignorance and excess in living.

"We believe that the progress of medical and surgical science has opened up such a way entirely practicable; humanitarian in the highest sense, unobjectionable except upon grounds of an absurd and irrational sentiment. The discoveries in the use of anesthetics and antiseptics have rendered it possible to remove or sterilize the organs of reproduction of both sexes without pain or danger. This is the simplest, easiest, and most effectual solution of the whole difficulty. . . . Such a removal would be a positive benefit to the abnormal rather than a deprivation; rather a kindness than an injury. This operation bestowed upon the abnormal inmates of our prisons, reformatories, jails, asylums, and public institutions would entirely eradicate those unspeakable evil practices which are so terribly prevalent, debasing, destructive, and uncontrollable in them. It would confer upon the inmates health and strength for weakness and impotence, satisfaction and comfort for discontent and insatiable desire. . . .

"The abnormal does not want children, has no affection for them, and gets rid of them as soon as possible if they come. If this were not so, their offspring, being abnormal, weak, sickly, diseased, deformed, idiotic, insane, or criminal, doomed to a burdensome and suffering existence or an early death, are a curse rather than a comfort to their parents; so that in no sense could the deprivation of these organs inflict injury or damage to criminal or pauper. On the contrary, they would be enabled thereby to enjoy many comforts and privileges, and be relieved from many restraints at present necessarily imposed upon them. The range of their enjoyments would, in fact, be greatly enlarged, both in confinement and at liberty. Many indeed might be allowed freedom who are now closely confined. . . .

"The remedy we suggest would certainly be effectual, an immeasurable benefit to the human race, the exercise of an inherent right which really injures none, and, moreover, it appears to have become an imperative duty which society owes to its own preservation, which may not be neglected without actual sin.

"Society arrests and confines the leper, the victim of smallpox, yellow-fever, cholera, or typhoid, and treats them according to its own will, with or against their consent. It does not hesitate to remove a gangrened limb, a diseased organ from the person, if it is necessary; it shuts up the insane, the imbecile, the criminal, for the public protection; it inflicts punishments of various degrees; compels men to labor without pay, for its good; dances; even deprives them of life if it pleases; assumes arbitrary control of the life, liberty, and happiness of an individual, if it considers it necessary for the public welfare; and no reasonable being questions its right or duty to do these things. At the same time it allows its deformed, and diseased in mind, body, and soul, to disseminate social leprosy and cancer with impunity, while the skill of its surgeons could prevent the infection by an operation almost as simple as vaccination. It seems inexplicable that the remedy should have been so long delayed."

PENSIONS IN THE UNITED STATES.

—A pension is a regular payment of money to a person by the Government in consideration of past services in its employ. Pensions were formerly granted in the United States only to enlisted men of the army or navy who had suffered during our various wars, except in a few special instances. But in 1869 an act

was passed providing pensions at the rate of their salary to United States judges who have served ten years and resigned at 70 years or upward. Pensions have also been granted to the widows of former presidents. Employees in the life-saving service, in the quartermaster's and paymaster's departments, and nurses have also received them. Private pension bills are often passed, but by far the largest number of pensioners of the United States are such under general laws.

The United States pension system may be said to commence with the resolution of Congress dated August 26, 1776, by which the Continental Congress undertook to provide for disabled soldiers of the Revolution. From June 7, 1785, to September 29, 1789, the several States assumed the payment of pensions by a recommendation of Congress on account of its inability to raise money by taxation. After the adoption of the new constitution, Congress resumed their payment by annual enactments, making them payable during the life of the beneficiaries, under the acts of March 23, 1792, and February 28, 1793.

Pensions were not provided for the children of Revolutionary soldiers. The first act providing pensions for disabled officers and soldiers of the regular army, was passed April 3, 1790, and its provisions were renewed and amended from time to time until they were

embodied in the act of March 16, 1802, which is now the fundamental law for pensions on account of disability incurred prior to March 4, 1861.

By act of March 3, 1835, the office of Commissioner of Pensions was created for two years. It was extended from time to time, and made permanent in 1849. He was to execute, under the direction of the Secretaries of War and Navy, such duties in relation to the various pension laws as might be prescribed by the President.

History.

On March 3, 1849, the pension office became a bureau of the newly created Department of the Interior. As at present organized its affairs are administered by a commissioner, under whose charge come all matters relating to pensions, and who is appointed by the President, by and with the advice and consent of the Senate, two deputy commissioners, a chief clerk, an assistant chief clerk, a law or appeal clerk, a board of legal reviewers, a board of medical reviewers, special examiners, examiners' clerks, copyists, messengers, laborers, and watchmen.

The pension laws since the War of Rebellion have been too numerous and too complicated to be given here, but the growth of our pension list till it has become the chief expense of the Government, is seen in the following table :

FISCAL YEAR ENDING JUNE 30.	ARMY AND NAVY.		Total Number of Applications Filed.	Total Number of Claims Allowed.	NUMBER OF PENSIONERS ON THE ROLL.			Disbursements.
	CLAIMS ALLOWED.				Invalids.	Widows, etc.	Total.

This steady growth of the pension list has led to much discussion as to the necessity of its revision. Representative proposals for revision have recently been made by many and prominently by Hon. R. P. C. Wilson, Chairman of the House Committee on Pensions (1895); General S. S. Burdett, Past Commander-in-Chief of the Grand Army of the Republic; and Colonel W. C. Church, editor of the *Army and Navy Journal*. All agree that our pension list needs to be revised in such a way as to make it indeed a roll of honor.

Representative Wilson says:

"All cases of reported fraud should be promptly investigated by the department through the medium of the force of special examiners in the field, but in no instance should a pensioner's name be dropped from the roll on any ground until he has been allowed the widest latitude to show his right to a continuance of his pension.

"There can be no doubt that the deserving soldier who went unflinchingly to the front at his country's call, and, while enduring the hardships of camp, march, and conflict incurred wounds or other permanent disabilities, regards the pension list as a roll of honor, and earnestly desires, with all other good citizens, the adoption of such measures by Congress, or by those charged with the administration of the laws, as will purge the list of all those who have been placed thereon through fraud or misrepresentation; but the undeserving class, which, unfortunately, constitutes a considerable proportion of the list, will never relinquish the benefits wrongfully acquired without a bitter and determined struggle, and many well-meaning and conscientious men in public life, who acknowledge and earnestly deplore the existence of pension abuses, will hesitate to align themselves on the side of corrective measures for fear of a possible adverse effect upon their political fortunes. I contend, therefore, that the administration of the pension laws should, if possible, be completely divorced from politics, and while I have not yet been able to fully satisfy my mind as to the practicability of the change, it may be found, upon careful consideration and investigation, that the transfer of the bureau to the War Department, proposed in a recently offered (but not adopted) amendment to the Pension Appropriation bill, and to the care of a courageous, able, and fair-minded army officer, would be a step in the right direction."

Pension Reform.

General Burdett points out that the outcry is not so much against our pension laws as against the methods and result of their administration.

"It is insisted in many quarters that the rolls are encumbered by names not lawfully entitled to be there. If this is true, it is indeed an outrage which calls for prompt correction. But the very vehemence, excess, and even rudeness of some of the assailants give warning that their charges ought not to be admitted in any measure until investigation has been had. If matters are as bad as they are asserted to be, there have been worse than mistake and mismanagement; there have been fraud and conspiracy. That all the probabilities are against this is indicated by the dearth of facts which the most hostile have been able to produce. Nevertheless, iteration and reiteration have had their effect upon the popular mind. There ought to be searching inquiry through dispassionate (not partisan) agencies. The great body of veteran survivors will welcome this.

"In the meantime the situation might as well be faced. Relief to the taxpayer is to come from the scythe of the great reaper. The beneficiaries are old men now. If not by the actual count of years, they are yet old because of the exposures and decrepitudes which come from their service. All but one of the great leaders in battle are dead; a division of their followers joins them every year. A little patience and the account will be closed."

Colonel Church says:

"One thing seems possible, and that is to so codify our pension laws as to make them intelligible and con-

sistent. Under their present interpretation there are, or were at the date of the last detailed report, no less than 119 grades of pay between the extremes of \$1 a month and \$72 a month, with three other grades of \$100, \$166.66%, and \$466.66% a month, supplied by special acts to a few exceptional cases. The advance from the lowest to the highest rate is by fractions of a dollar, the average advance being 60 cents.

"Another reform that has been suggested is to permit the employment of trained actuaries to determine the exact extent of the burden upon the public treasury. What this is no one now knows, and for a succession of years the Commissioner of Pensions has been obliged to guess at it, as nearly as he could, and to ask Congress, later on, to make good the deficiency occasioned by his insufficient estimate.

"Finally, and most important of all, Congress should provide for printing a list of pensioners, with a statement of the reason for granting a pension in each case. To this should be added a list of those applying for pensions whose cases are pending, including the claimants for increase of pensions. Such a list should be widely distributed instead of being confined, as was the one printed some years ago, to a few copies, passing at once into the hands of persons interested in suppressing the facts. Every army officer should receive copies, and every organization representing old soldiers, and it should be sent to each post-office to be posted there. The attempts made thus far to revise our pension rolls have not paid their cost. The two or three hundred special examiners employed last year succeeded in convicting only 122 fraudulent pensioners, or fourteen-one-hundred-thousandths (.00014) of 1 per cent. of the whole number of pensioners. . . .

"While endeavoring to set forth fairly the exact condition of the pension problem, I must confess that I have no great sympathy with the present disposition to criticize our appropriations for pensions. We are reaping what we have sown, and in the end we may learn that the money expended in preventing war, or in preparing ourselves to conduct it with efficiency, is quite as wisely bestowed as that devoted to paying later on for our neglect, and we may find comfort for ourselves in the fact that our expenditures for pensions, at the worst showing, will not, after the arrears of pensions are settled, exceed the amount contributed annually to the public treasury by the tax upon liquors and cigars. We may be content with the knowledge that it is the vices of our people that are providing for the comfort of our old soldiers, not one of whom should fail to receive what is honestly his due in the way of public support, and let those who object to contributing to this refrain from smoking and drinking. Our liberality toward veterans is in the line of our increase of national expenditure in a ratio beyond that of an increase of population. In 1821 this increase was \$6,000,000 in excess of this ratio, and in 1870 \$164,400,000 in excess. Pensions are not peculiar to the American service; for example, every British soldier receives one after an enlistment of 21 years, and a temporary or permanent pension after 12 years, if discharged as an invalid or rendered unfit for service.

"We give pensions for a service of 60 days and even for one of 14 days; our pensions are much more liberal and our pensioners much more numerous. That is all the difference. We overlook the distinction between civilians in uniform and soldiers, and put upon the same footing the 'bounty-jumper' and the man whose loyal devotion to duty takes no thought of personal advantage."

PEOPLE'S PARTY.—In 1884 Benjamin F. Butler of Massachusetts was nominated for the Presidency by the Anti-Monopoly Party at Chicago, and by the Greenback Labor Party at Indianapolis. He received some 133,000 votes. This common ticket of the two parties was known as the People's Party ticket. The People's Party of the present, however, which we describe in this article, is quite another and a larger party. At the convention of the Farmers' Alliance at Ocala, Fla., in 1890 (see FARMERS' ALLIANCE), there was a strong disposition to form a new party. It was decided, however, not to take any steps toward such an end as an Alliance, but to

leave members free to act as they pleased. A few remained, and issued a call for a convention, forming a National Citizens' Alliance, to move in this direction. The movement, however, that actually resulted in the formation of the party came from Kansas. (See FARMERS' MOVEMENT.) In April, 1890, the Kansas Alliance officers had met in obedience to the pressure of Alliance opinion, to consult as to a new political party, but seemed undecided, and so called for a delegate meeting in June. At this delegate convention the People's Party of Kansas was organized. The delegate representation was as follows: Farmers' Alliance, 41; Knights of Labor, 28; F. M. B. A., 10; Patrons of Husbandry, 7; Single-Tax Clubs, 4; total, 90. The Alliance delegates were really in the minority.

An enthusiastic State campaign was conducted, resulting in carrying the State to the extent of controlling the House. Alliance measures passed in the House were killed in the Senate; but in the union of House and Senate, the Alliance succeeded in defeating the re-election of Senator Ingalls, and sending to Washington the Alliance advocate, Senator Pepper (*q. v.*), in his place. This success largely led to the sending out of a call to all parties willing to co-operate in holding a National Convention in Cincinnati, May 19, 1891.

History.

This met, and 1418 delegates were present. Of these more than one quarter were from Kansas alone, more than one-half coming from Kansas and Ohio, and more than three-quarters from six States, Kansas, Ohio, Indiana, Illinois, Missouri, and Nebraska. There were only seven from Massachusetts, and even a less number from most of the Eastern States. The organized labor of the East was scarcely represented. Mr. Powderly, General Master Workman of the Knights of Labor was present and in sympathy with the movement, but not a delegate. Nevertheless it was a national convention more truly than these facts would at first indicate. It was a convention largely composed of farmers and Greenbackers, but in perfect sympathy with organized labor in factory, mine, and store; and the convention voted to call another convention in 1892, at which all bodies of workers should be represented, and which should nominate national candidates. The enthusiasm of the convention went beyond all bounds.

The one heated discussion was as to Prohibition, a clause proposing which was hotly debated but finally overwhelmingly defeated, not so much in opposition to Prohibition, as from fear lest such a plank might produce division.

The convention developed an almost religious earnestness, as has indeed been characteristic of the whole Alliance movement. Senator Pepper, who presided, said that "the Alliance with ballot and prayer was in a great measure taking the place of the Church." A National Executive Committee was formed, with Robert Schilling as its secretary.

In accordance with the decision of the Cincinnati convention, a nominating National

Convention was held at Omaha, Neb., July 4, 1892, concluding its labors on July 5. By its action the present People's Party was launched upon the sea of politics. The greatest of excitement and enthusiasm was displayed, sometimes almost verging on the edge of wildness.

Omaha Convention.

The names of Gresham and Weaver had been prominently before the convention, but Weaver won on the first ballot, receiving 995 votes. General Field of Virginia was nominated for Vice-president. (For text of the platform, as reported and adopted at Omaha, see OMAHA PLATFORM.)

In 1892, the Presidential votes (popular and electoral), and in 1894 the State votes for Governor or Representatives to Congress of the People's Party were, according to the *World Almanacs* for 1895 and 1896, as follows:

STATES.	PRESIDENTIAL VOTE, 1892.		STATE, 1894.

* For Representatives to Congress.

† For State Treasurer.

‡ For Secretary of State.

|| For Judge of Supreme Court.

§ No candidate. Estimated at Presidential vote.

¶ 1893.

Of the Presidential vote in 1892 it must be noted that in the States of Colorado, Idaho, Kansas, North Dakota, and Wyoming the Democrats ran no electoral tickets, and voted for the Populist electoral tickets for the purpose of taking those States from the Republicans. With a few exceptions they also voted for the Populist electors in Nevada. In Louisiana the Republican party and Populist united their vote, each nominating half of the eight candidates for electors, and in the table their aggregate popular vote is divided.

In five States the electoral vote was divided: in California and Ohio because the vote for the Cleveland and Harrison electors was so close; in Michigan because, by act of Legislature, each Congressional District voted separately for an elector; in Oregon because one of the four candidates for electors on the Populist ticket was also on the Democrat ticket, the result being three Republicans and one Populist elected; in North Dakota because one of the two Populist electors who were elected cast his vote for Cleveland, this causing the electoral vote of the State to be equally divided between Cleveland, Harrison, and Weaver.

Some of the People's party organs claim that in many States, especially in the South, the votes of the party are not counted or are miscounted to such an extent that the real Populist vote was nearer 2,000,000 than 1,500,000. Even at the smaller figures, the party leaders claim that a party polling a million votes at its first Presidential election, and increasing this 50 per cent. in two years, shows unequaled vitality. That the Populist vote was reduced in some of its strongholds they lay to local reasons, and assert that because of the fusing of parties in the Presidential election in some States, the apparent losses of the Populist vote in a few States were only apparent, and that, take the country through, a very great advance was made. In Congress, the Populist strength in the Fifty-third Congress (March 1893-'95) was 5 Senators and 70 Representatives; in the Fifty-fourth Congress (March, 1895-'97) 5 or 6 Senators, and 60 or 7 Representatives, in the Fifty-fifth Congress 6 Senators and 16 Representatives.

In 1895, in an off year and with a light vote, the People's Party slightly lessened its vote in Kansas, Nebraska, Iowa, Massachusetts, and New York, and somewhat increased it in Minnesota, Mississippi, Ohio, and Texas.

In 1896 the Democratic party (*q. v.*), having adopted a platform favoring free silver at a ratio of 16 to 1, and so far inclining to some other Populist demands that it was continually called a Populist platform, the People's party Convention at St. Louis, July 24, voted, after a prolonged and heated debate, to support the Democratic

Election of 1896.

nominee, Mr. William J. Bryan, the nominating a Vice-Presidential candidate of their own, Thomas E. Watson, of Georgia. A heated minority claimed that this result was gained by political intrigues of the Democratic leaders. For the platform see APPENDIX. For the election see PRESIDENCY. Since the election some Populists have advocated the breaking off of all alliance with the Democratic party; others, however, incline to renew the battle in 1900, on the same grounds as in 1896.

(For a discussion of the silver issue, see SILVER, FREE SILVER, BIMETALLISM, CONTRACTION AND EXPANSION OF THE CURRENCY, and CURRENCY. For the farmers' movement, see FARMERS' MOVEMENT. For the tendency of the People's party to Nationalism, see NATIONALISM.) Concerning *The Mission of the Populist Party*, Senator Peffer writes in the *North American Review* of December, 1893:

"The Populist party is an organized demand that the functions of government shall be exercised only for the mutual benefit of all the people. It asserts that government is useful only to the extent that it serves to advance the common weal. Believing that the public good is paramount to private interests, it protests against the delegation of sovereign powers

to private agencies. Its motto is: 'Equal rights to all; special privileges to none.' Its creed is written in a single line of the Declaration of Independence—'All men are created equal.' Devoted to the objects for which the Constitution of the United States was adopted, it proposes to 'form a more perfect union' by cultivating a national sentiment among the people; to 'insure domestic tranquillity' by securing to every man and woman what they earn; to 'establish justice' by procuring an equitable distribution of the products and profits of labor; to 'provide for the common defense' by interesting every citizen in the ownership of his home; to 'promote the general welfare' by abolishing class legislation and limiting the Government to its proper functions; and to 'secure the blessings of liberty to ourselves and our posterity' by protecting the producing masses against the spoliation of speculators and usurers.

"The Populist claims that the mission of his party is to emancipate labor. He believes that men are not only created equal, but that they are equally entitled to the use of natural resources in procuring means of subsistence and comfort. He believes that an equitable distribution of the products and profits of labor is essential to the highest form of civilization; that taxation should only be for public purposes, and that all moneys raised by taxes should go into the public treasury; that public needs should be supplied by public agencies, and that the people should be served equally and alike.

The party believes in popular government. Its demands may be summarized fairly to be:

"1. An exclusively national currency in amount amply sufficient for all the uses for which money is needed by the people, to consist of gold and silver coined on equal terms, and government paper, each and all legal tender in payment of debts of whatever nature or amount, receivable for taxes and all public dues. **Demands.**

"2. That rates of interest for the use of money be reduced to the level of average net profits in productive industries.

"3. That the means of public transportation be brought under public control, to the end that carriage shall not cost more than it is reasonably worth, and that charges may be made uniform.

"4. That large private land-holdings be discouraged by law.

"It is charged against Populists that they favor paternalism in government. This is an error. They only demand that public functions shall be exercised by public agents, and that sovereign powers shall not be delegated to private persons or corporations having only private interests to serve. They would popularize government to the end that it may accomplish the work for which it was established—to serve the people; all the people, not only a few.

"If it be paternalism to require the Government to look after any of the private interests of the people, why do we not drive from our grounds as a tramp the postman who delivers our mail? If it be paternalism to bring our transportation business under public control, why do we not repeal the inter-State commerce law and restore the carrying trade to private citizens from whose rapacity the people were partially released some years ago? If it be paternalism to establish government agencies to supply currency to the people, what means the national bank act whose title reads: 'An act to provide a national currency secured by a pledge of United States bonds, and to provide for the circulation and redemption thereof?'

"All there is in the charge of paternalism lies in the fact that Populists believe that, as to these particular matters, the people would be served more equitably, and at greatly reduced expense, by public agents working on fixed salaries, than by private persons who use their business for private ends.

"It will be observed that the party deals with live issues only, and they are those chiefly which relate to the use of natural resources of subsistence and to the distribution of property and property values. This is the only party that clearly expresses a well-defined position on the 'money question.' It states the kind of money the party wants—gold, silver, and paper; it demands that the metals be coined freely, in unlimited quantities, at a ratio of 16 to 1; that the currency shall be issued by the General Government only—not by banks—and that it shall be a full legal tender. . . .

"The Populist party is the only party that honestly favors good money. Democrats and Republicans alike declare their purpose to make all dollars equally

good and to maintain the parity between them, and the recent Act of Congress repealing the purchasing clause of the Sherman law contains a similar declaration; but when an amendment was proposed to the bill in the Senate to make good the platform promises by incorporating them in the law, there were not enough Senators in favor of it to secure a yeay and nay vote on the amendment.

Money Issue.

We have seven different kinds of money, and only one of them is good, according to the determination of the Treasury officials. Bank-notes are not legal tender, neither are silver certificates nor gold certificates. Treasury notes are not legal tender in cases where another kind of money is expressed in the contract, and United States notes (greenbacks) will not pay either principal or interest on any government bond. None of our paper money is taxable. Silver dollars are by law full legal tender in payment of debts to any amount whatever, but the Treasury does not pay them out on any obligation unless they are specially requested. In practice, we have but one full legal tender money—gold coin; and Republicans and Democrats are agreed on continuing that policy; while Populists demand gold, silver, and paper money, all equally full legal tender.

"The fact that we have now out about \$700,000,000 in paper is proof that our stock of coin is utterly inadequate to perform all the money duty required in the people's business transactions. The discontinuance of silver coinage stops the supply from that source. It is believed by men best informed on the subject that the gold used in the arts has reached an amount about equal to the annual output of the mines. Then the world's stock of gold coin will not be increased unless the arts are drawn upon, and that can be done successfully only at a price above the money value of the coin. Russia, Austria, Italy, and the United States all want more gold. Where is it to come from? And what will it cost the purchaser? Are we to drop back to Roman methods of procuring treasure? When all the nations set out on gold-hunting expeditions, who will be the victor and what will become of the spoils?"

"It is evident that we must have more money, and Congress alone is authorized to prepare it. States are prohibited by the Constitution of the United States from making anything but gold and silver coin a legal tender in payment of debts, and nothing is money that is not a legal tender. The people can rely only on Congress for a safe-circulating medium.

"Populists demand not only a sufficiency of money, but a reduction of interest rates at least as low as the general level of the people's savings. They aver that with interest at present legal and actual rates, an increase in the volume of money in the country would be of little permanent benefit, for bankers and brokers would control its circulation, just as they do now. But with interest charges reduced to 3 or 2 per cent. the business of the money-lender would be no more profitable than that of the farmer—and why should it be?"

"While the Populist party favors government ownership and control of railroads, it wisely leaves for future consideration the means by which such ownership and control can best be brought about. The conditions which seem to make necessary such a change in our transportation system preclude all possibility of its ever being practicable, if it were desirable, to purchase existing railway lines. The total capitalization of railways in the United States in 1890 was put at \$9,871,378,380—nearly ten thousand million dollars. It would be putting the figures high to say that the roads are worth one-half the amount of their capital stock. This leaves a fictitious value of \$5,000,000,000 which the people must maintain for the roads by transportation charges twice as high as they would be if the capitalization were only half as much. It is the excessive capitalization which the people have to maintain that they complain about. It would be an unbusinesslike proceeding for the people to purchase roads when they could build better ones just when and where they are needed for less than half the money that would be required to clear these companies' books. It is conceded that none of the highly capitalized railroad corporations expect to pay their debts. If they can keep even on interest account they do well, and that is all they are trying to do. While charges have been greatly reduced, they are still based on capitalization, and courts have held that the companies are entitled to reasonable profits on their investment. The people have but one safe remedy—to construct their own

roads as needed, and then they will 'own and control' them."

PÉRIN, HENRI XAVIER CHARLES, born at Mons (Hainaut) in 1815, and educated at Louvain, was in 1844 chosen to the chair of Political Economy and Law in the Catholic University of Louvain, and occupied this position 37 years, retiring as Emeritus professor in 1881. A learned professor and frequent writer, he may be considered one of the main teachers of economics from the standpoint of Roman Catholicism. His work on the *Laws of Christian Society* is prefaced by a Pontifical breve, dated February 1, 1875, full of unqualified praise from the Pope.

His main works are *Les Économistes, les Socialistes et le Chrétianisme* (1849); *De la Richesse dans les Sociétés Chrétienues* (1861); *Le Socialisme Chrétien* (1879), with an appended discourse delivered by C. Périn at the opening of the Congress of the Directors of the Roman Catholic Workmen's Association, at Chartres, August 9, 1878; and his last work but one, *Les Doctrines Économiques depuis un Siècle*, published in 1880, which contains in its closing chapters a most interesting account of the various Catholic associations for the good of the working classes in France and Belgium. The last work, of mixed essays, contains the author's views on subjects of social interest which have occupied the attention of the world for the last twenty years.

Périn founds social order on Divine authority, but he trusts to the moral influence of the Church rather than mechanical obedience to her laws, as pronounced *ex cathedra*.

"We are at present agreed among ourselves to proclaim the rule of Christian liberty as the law of economics, a liberty equally remote from the extremes of license and absolutism, from the *laissez-faire* system, which is the boast of Liberals, and State control over life and property, which, in one form or another, socialism proclaims to be just and necessary."

Périn allows that, in exceptional cases, repressive measures by the State are necessary; but under ordinary circumstances, he thinks, the preventive measures proposed by Christian Socialism, in its endeavors to revive the moral force of self-restraint and self-denial, will prove sufficient. He acknowledges the impossibility of returning to medieval forms of corporate union, but strongly recommends the revival of that principle of Christian love which inspired them.

PEROVSKAYA, SOPHIA (born 1854, executed 1881), was one of the ablest leaders of the Russian revolutionists. By birth a member of the highest aristocracy of Russia, the despotism that was being enacted around her early roused a hatred of oppression and desire to protect the oppressed.

In Russia, during the decade 1860-70, there was fought out the battle of woman's right to think for herself and to study what she would. Kept in ignorance and in constant subjection

to the tyranny of the master of the house, the position of women was a hard one. When, however, the Nihilist philosophy (see Nihilism) spread over the land, the women caught the flame, and demanded the right of access to the study of science and philosophy and freedom to think for themselves. In 1869 Sophia Perovskaya, when refused permission by her father, ran away from home, determined to study and know for herself. When at last her father relented and provided her with a passport, she was free to pursue her studies. The wider horizon thus opened to her led to the conviction that the present social arrangements were on a wrong basis, and indicated socialism as the remedy. Meeting with others who shared similar views, they joined themselves into a secret society or "circle" for the purpose of spreading the propaganda among the young, and later, in 1871, upon her suggestion, the propaganda was turned in the direction of the working men. All this work had to be carried on by secret means, and with constant danger to the teacher, for the Russian Government was ruthlessly suppressing all such endeavors. Toward the end of 1873 Sophia Perovskaya was arrested while carrying on the agitation in St. Petersburg; and after being imprisoned for a year was released on the bail of her father, but had to go to the Crimea; where for three years she was still practically a prisoner in her own home. In 1877 she was brought to trial, in the "trial of the 193," and with many others was acquitted—but instead of being allowed to go free, she was exiled on a police order, to one of the northern provinces. Escaping very soon afterward, she returned to St. Petersburg, and again took up active work for the revolutionary cause. By this time, however, the methods had changed, and "terror" was the weapon that had to be used. In all the terrorist enterprises, from 1878 till her death in 1881, she took an active part; often being the director and controller of the most desperate of them, such as the Moscow mine which was to blow up the Imperial train, and the attempt which succeeded in assassinating the Czar on March 13, 1881. A week later she was arrested, and on April 15 was hanged with Kibalctic, Geliahoff, Timothy Micalloff, and Rissakoff. Possessing a combination of characteristics seldom or never matched, Sophia Perovskaya was and is the heroine whose example fires the hearts of the Russian revolutionists with increased enthusiasm. In person very beautiful, and only 26 when she died, for eleven years she had devoted her whole life to the cause of Russian freedom. Filled with enthusiasm, and with a determination as unyielding as adamant, she was able to excel in everything she undertook, and, with it all, of so kindly and loving a nature that all those with whom she worked, at once entertained the warmest regard for her. (See Nihilism.)

PERRY, ARTHUR LATHAM, was born in Lyme, N. H., in 1830. He was graduated at Williams in 1852, and has been professor of history and political economy there since 1853. An ardent free-trader, he has delivered

many lectures and addresses on this subject, besides writing editorially for the *Springfield Republican*, and the *New York Evening Post*. Union College gave him the degree of LL. D. His works on economic science are *Political Economy* (1865) and *Introduction to Political Economy* (1877). His works have been much used as text-books, and the 20th edition of his *Political Economy* appeared in 1890.

PERSONAL LIBERTY LAWS were laws passed by several of the Northern States during the existence in the United States of the fugitive-slave laws (*q. v.*), for the purpose of securing to alleged fugitives the privilege of the writ of *habeas corpus*, and of trial by jury, which the fugitive-slave laws denied. The first was passed by New York State in 1840.

PERSONAL LIBERTY MOVEMENTS.—There have been various spasmodic efforts at different times to organize personal liberty societies, and sometimes even a personal liberty party, to defend and agitate for the claimed right of the individual to govern his own acts in certain lines in which the State had interfered or it was proposed that the State should interfere. None of these movements, however, have taken enduring form. They have been organized simply at times of special excitement, when certain classes have believed their personal liberties threatened. Germans in New York City, *e. g.*, have proposed such organization against anti-saloon or Sunday-closing legislation. In England, the Liberty and Property Defense-League (*q. v.*) is organized against general socialistic legislation.

(For the principles involved, see ANARCHISM, INDIVIDUALISM, SPENCER.)

PERSONAL LIBERTY PARTY.—The strict enforcement in New York of laws directed against the sale of liquor on Sundays caused the formation there of an organization favoring the abolition of such restrictions on the sale of liquor as are deemed to conflict with the liberty of the individual, that is, the total prohibition of its sale on Sunday. This organization took the name of Personal Liberty Party, and in New York, on October 6, 1887, adopted a platform declaring that laws of the above description have notoriously failed to improve morality, while they interfere with the personal liberty of the individual; and citing, as people whose habits of life are thus interfered with, the German element of our population, who are "assiduous, temperate, and law-abiding people."

It has had small influence. Even those who believe in this so-called "personal liberty" knew that it was simply a party formed by liquor sellers anxious for business.

PERSONAL PROPERTY. See PROPERTY.

PERSONAL WEALTH. See WEALTH.

PERU, SOCIALISM IN ANCIENT.—Peru in its ancient sense included a vast extent of territory on the Pacific slope of South

America. It was inhabited by many different tribes and nations, all, however, under the scepter of the Incas. The Peruvians were in some respects, though not in all, the most civilized of all the native inhabitants of the New World, and they had certainly come the nearest of any to the formation of a true nationality. It is probable that four tribes of the Andes table-land, the Quichuas, the Incas, the Canas, and the Canchas, formed the nucleus of the nation. From the first comes the name of the language of ancient Peru, Quichua. The second tribe, Incas, was probably the conquering tribe, and hence became the rulers, or ruling caste. The career of conquest of this tribe or caste, according to native annals, began with the first Inca, Manco Capac, about 1280 A. D.; and before the time of the arrival of the Spaniards the petty State had become a great empire. It then extended from a point north of the equator to Chile, a distance of 2700 miles, and its area was more than 800,000 square miles.

The government of the Incas was a despotism, a theocracy, and a unique example of paternal and State socialism. At the head was the Inca, an absolute monarch, but more than a monarch—a god-king, a living incarnation of the sun. Next to him came the Inca nobility, who were regarded as superior beings, and by whose aid the Inca governed the people.

The empire was the result of military conquest and occupation. As peoples were subdued, the laws and even the language of the Incas were imposed on them. The security of the government was secured by an elaborate system of military roads and defenses. There were four great provinces, to each of which ran a great road. Each province had a viceroy appointed by the Inca. The highways were solidly built of stone, and carried with great skill over the heights of the Andes. They radiated from Cuzco, the capital, as a center. Cieza de Leon, an early chronicler, says of the great highway from Cuzco to Quito, that the roads made by the Romans in Spain are not to be compared with it. Along these roads at certain intervals there were storehouses. An elaborate system of couriers also made communication with different parts of the empire easy. But this military system, natural in all powerful despotisms, was carried also into the industrial organization. Peru was remarkable for this. A highly artificial and thoroughly centralized system of the regulation of industry existed. There was no private property; everything belonged to the State, and everything was managed by the State. It was a communistic despotism. Of the entire produce of the nation two-thirds went to the Inca, the nobles, and the priesthood as taxes, one-third only to the people, although they were the only producing class.

In regard to the details of industrial organization Fiske states (*Discovery of America*, vol. ii. p. 353):

"Families and villages were organized upon a decimal system, like companies and regiments. The average monogamous family of five persons was the unit. Ten such families made a *chunca*, ten *chuncas* made one *pachaca*, ten *pachacas* one *huaranca*, and ten *huarancas* one *hunu*, so that a *hunu* was a district

with a population of about 50,000 persons. Each of these decimal subdivisions had its presiding officer, who was responsible directly to his immediate superior, and ultimately to the Inca. The decurion was obliged to perform two duties in relation to the men composing his division. One was to act as their carter, to assist them with his diligence and care on all occasions when they required help, reporting their necessities to the governor or other officer, whose duty it was to supply seeds when they were required for sowing; or cloth for making clothes; or to help to rebuild a house if it fell or was burned down; or whatever other need they had, great or small. The other duty was to act as crown officer, reporting every offense, how slight soever it might be, committed by his people, to his superior, who either pronounced the punishment or referred it to another officer of still higher rank" (*Garcillaso*, lib. ii. cap. xii.).

The land belonged to the village community (*chunca*). It was redistributed at times to maintain equality.

Land was divided into *tupus*, one *tupu* for each family, with additions for children. All the farming operations and those of irrigation were supervised by the decurion. If a village suffered from war, or pestilence, or earthquake, other villages were assessed to repair the damage.

It is remarkable that such an artificial system, originally intended for a petty State, could have been adapted to a large empire made up of many different peoples. But it must be remembered that these peoples had not reached a high grade of culture; the social organization was simple, to begin with. There was little division of labor, and little extension of human wants. Exchange was limited, for there was no money of any kind and trade was by barter. Fiske explains the existence of the peculiar Inca State socialism by the theory that the formation of nationality and the establishment of a ruling caste took place before there had been much development of the idea of private property among the people, so that the result was a communistic despotism. In becoming naturalized the State stiffened into despotism.

Notwithstanding the complete repression of individual liberty under the Inca government there are great excellencies to be ascribed to it. Of these, the chief is that poverty and idleness were entirely abolished. Every one worked, and every one was taken care of by the State. Prescott, though inclined strongly to individualism, says (*Conquest of Peru*, vol. i. p. 173):

"With their manifold provisions against poverty the reader has already been made acquainted. They were so perfect that in their wide extent of territory—much of it smitten with the curse of barrenness—no man, however humble, suffered for the want of food and clothing. Famines, so common a scourge in every other American nation, so common at that period in every country of civilized Europe, was an evil unknown in the dominions of the Incas."

In another passage he says (*Conquest of Peru*, vol. i. p. 63):

"If no man could become rich in Peru, no man could become poor. No spendthrift could waste his substance in riotous luxury. No adventurous schemer could impoverish his family by the spirit of speculation. The law was constantly directed to enforce a steady industry and a sober management of his affairs. No mendicant was tolerated in Peru. When a man was reduced by poverty or misfortune (it could hardly be by fault) the arm of the law was stretched out to minister relief; not the stinted relief of private charity, nor that which is doled out, drop by drop, as

it were, from the frozen reservoirs of 'the parish,' but in generous measure, bringing no humiliation to the object of it, and placing him on a level with the rest of his countrymen."

The system of the Incas had produced in many respects an industrious and happy people. Yet it fell to pieces before the Spanish invaders, with wonderful rapidity, because there had been nothing in it to nourish the spirit of patriotism and of independence in the people.

Modern socialism, dealing with the complex problems of a highly developed civilization, can learn little from Peru, where the state of society was primitive and the conditions entirely different. The State socialism of the Incas was unlike anything that ever existed elsewhere, or is likely ever to exist.

PETTY, SIR WILLIAM, was born at Romsey, Hampshire, England, in 1623. An English publicist, he sided with Parliament in the Civil War. In 1651 he was professor of anatomy at Brasenose, Oxford, and of music at Gresham College. In 1652 he was appointed physician to the army in Ireland, and about 1654 executed by contract a fresh survey of the forfeited lands granted to soldiers. He bought large tracts of land and established various industries. He was knighted after the Restoration. In 1663 he invented a double-bottomed boat. He wrote *Quantulumcumque; or, a Tract Concerning Money* (1682); *A Treatise of Taxes and Contributions* (1662-85); *Essays on Political Arithmetic* (1691); *Political Anatomy of Ireland* (1691). He died in London in 1687.

Cossa calls Petty "one of the most illustrious fore-runners of the science of statistical research," and Ingram considers him a writer of much sagacity and good sense. He belongs to no school, opposing many of the errors of the mercantilists, yet sharing some of their views. On several he anticipates or at least gives germs of the conclusions of Ricardo and Adam Smith. One of his leading thoughts was that "labor is the father and active principle of wealth; lands are the mother." He divides population into two classes, the productive and non-productive. The value of any commodity depends, with him, on the amount of labor necessary for its production. He chooses as his unit of value the average food of the cheapest kind required for a man's daily sustenance. He opposes government control of interest, and industry generally. A study of Petty, by W. L. Bevan, was published by the American Economic Association, August, 1894.

PHILLIPS, WENDELL (1811-84), abolitionist, orator, and reformer, was born at Boston, the descendant of a family of aristocratic position. His father was first mayor of Boston in 1822. He was educated at Harvard, and called to the Suffolk bar in 1834. The agitation on the slavery question was at its height. It was in 1835 that a Boston mob, moved by the commercial spirit, dragged Garrison through the streets by a rope. This event made a profound impression on Phillips, and in 1837 he identified himself with the anti-slavery cause. In a Faneuil Hall meeting,

called to protest against the murder of Lovejoy, he made an eloquent speech as champion of anti-slavery principles. Believing, like Garrison, that slavery was a national sin, he gave up his profession because it required the observance of an oath of fidelity to the United States constitution. He consecrated his life to the fight against slavery, and did a great work for years in the North by his wonderful eloquence. His speeches on behalf of abolition were full of force and inspiration, notably that uttered over the grave of John Brown of the Harper's Ferry raid. He also spoke, with perhaps equal power, on temperance, the emancipation of women, and labor reform.

Phillips, as has been said, advocated the doctrines of the Garrisonian abolitionists, who believed the constitution of the United States to be an immoral compact between freedom and slavery, and who therefore refused allegiance to it, abstained from voting, and labored for the dissolution of the Union as the best means of negro emancipation. When the war came he urged, from the beginning, the duty of emancipation, and he even opposed the reelection of Lincoln, because he did not go far enough. In 1865, Garrison proposed that the anti-slavery society should be disbanded. He had been its president for thirty years. But Phillips wished the society to exist for the purpose of securing for the negro his constitutional right of suffrage. Hence he took Garrison's place, and after full citizenship was won for the negro, in 1870, he resigned the office of president, tho he continued to work for the removal of race distinctions in public resorts, etc.

In 1870, his newspaper, the *Anti-Slavery Standard* was converted into a monthly magazine.

Phillips now turned his attention to other social reforms. He spoke for women's rights, a cause in favor of which he had pronounced as early as 1840. His sympathies were also enlisted in behalf of the Indians, and he continued to be the champion of the temperance cause.

But the sufferings of the working classes had made a deep impression upon him, and he became an advocate of thorough social and economic reform. In 1870 he was the candidate of the labor reform party for governor of Massachusetts. He entirely favored the Greenback party and worked with it. Harvard College had always ignored Phillips, but in 1881, when he was 70 years old, he was selected to deliver there the address on the occasion of the Centennial anniversary of the Phi Beta Kappa society.

As an orator Phillips is easily in the very first ranks of those whom America has produced. As a social reformer he was devoted and unselfish, and his work was fruitful in the highest degree. He died at Boston, February 2, 1884.

PHILOSOPHICAL ANARCHISTS. See ANARCHISM.

PHYSIOCRATS (from Gr. *φύσις* nature, and *κρατία*, rule), a name given to a school of

French economists and philosophers which arose in the eighteenth century, largely led by François Quesnay (*q. v.*), 1694-1774. The distinguishing doctrines of the physiocrats were that a so-called natural constitution or order exists in society, the violation of which causes all the evils suffered by man; that in this natural order man has a fundamental and inalienable right to freedom of person, opinion, property, contract, or exchange. The physiocrats held that all wealth is derived from the soil, thus denying the principle of the mercantilists (*q. v.*), who virtually held that wealth consists in the precious metals. All labor expended in manufacture or in commerce the physiocrats held to be sterile, tho useful, in that, while it transferred or transformed wealth, it did not produce it. Thus, conceiving all wealth to be produced from the soil, they argued that all revenues for the State should be derived by a direct tax on land, and thus became the predecessors of the believers in the Single Tax (*q. v.*). They advocated complete freedom of trade and *laissez-faire*. Their influence on their day and succeeding thought was very deep, altho not always acknowledged. Adam Smith (*q. v.*) seems to have imbibed and to have been influenced by very many of their ideas. For the details of their school and its leaders see their respective names (see, also, POLITICAL ECONOMY). Dr. Gustav Cohn, in his *History of Political Economy*, translated by Dr. J. A. Hill, says of the physiocrat school as a whole :

"The French philosophical school of the eighteenth century, which deserves the lasting honor of having founded a science of economics, was at first much ridiculed by its contemporaries and later—on account of its growing influence and questionable conclusions—much abused. . . . It is none the less true, as Knies declares in his reply to Hildebrand, that 'however little credit they may get for it in the popular tradition, much of their thought—is the presented to be sure in the name of Adam Smith—is still regarded as unshaken truth.'"

The enduring importance of the Economists consists in the eminent ability with which, unlike their predecessors, they comprehended and formulated in a philosophical system the practical characteristics of their own age. Realizing that the working man was overburdened with taxes and feudal dues, they were led to adopt an entirely new theory of productivity. The realism of Adam Smith brought this theory into closer relations with practical life; but Smith, far from developing the doctrine scientifically, did not even understand it; and so the thread of the argument was not taken up again until Ricardo's time. Upon this conception of productivity the physiocrats built up their single-tax theory, which furnished a scientific basis for the principle, the assessment, and the obligation of taxes; they established a philosophical foundation for their aversion to the regulations which absolutism had adopted from the corporations of the Middle Ages; the corner-stone of this foundation was the principle of self-interest, the workings of which, borrowing from the mechanical ethics of the century, they traced to natural law; all this, and even more, was the peculiar work of the Physiocrats.

They demanded the reign of the natural order (*ordre naturel des choses*) and hence the Greek name given them by one of their followers (Dupont de Nemours).

In emphasizing the productivity of agriculture, or indeed in calling it the only productive occupation, the Physiocrats are not to be understood in the sense falsely imputed to their words; for they did not mean that the heavily burdened peasant was the only productive man. Indeed, the real meaning of the word productive, as applied by them to agriculture solely, has a much wider significance than any philistine comparison of the advantages of manufactures on the one hand with those of agriculture on the other. As the deliverance of the starving masses from the tradi-

tional pressure of taxation and feudal burdens was uppermost in the thoughts of the Physiocrats, they deduced from the theory of the exclusive productivity of agriculture (that is, the yielding of a surplus over the cost of production) their argument in favor of a single tax. This tax should bear heavily upon the land-owners; hence, the theory could assume an aspect friendly to agriculture only by the complete separation of land-owners from the peasant classes, being favorable in such a case to the masses, whose misery had already attracted the attention of Sully and Colbert.

From a practical standpoint, the essential thing is not so much the prominence given to agriculture compared with industries and manufactures, as the intercession in behalf of the masses of laboring people; not the presentation of a new theory of taxation, but the demand for the deliverance of the masses from the burdens of traditional imposts. It is only because the masses were engaged in agriculture, and only so far as agriculturalists belonged to the working masses, that the demands of the physiocrats were favorable to agriculture.

Their theory of a natural tax, the *impôt unique* or *impôt direct*, is admirable for its scientific consistency with their system; how thoroughly socialistic it is in its opposition to the landlords has for the most part entirely escaped notice in the usual repetition of their "over-estimation of agriculture." Indeed, the physiocrats declared that the landlords were entirely superfluous, as they performed no labor; that if the State should absorb the entire rent, and thereby deprive them of their means of support, society would be just as well off as it was before; and that the landlords, therefore, should be quite content if the State, to provide for its wants, took a part only of the rent of their land as a just compensation for the protection it afforded their property.

Cohn criticizes the physiocrats for the ambiguity that lay in their conception of a natural law of social life, which led them to limit nature to agricultural activities, and thus to limit the surplus which should be taxed to the rent of land. (See SINGLE TAX.)

The most prominent Physiocrats were Quesnay (*q. v.*), the physician of Louis XV. (*q. v.*); Turgot (*q. v.*), intendant and minister of Louis XVI.; Marquis Mirabeau (*q. v.*); Abbé Baudeau, and Mercier de la Rivière. Baudeau produced a text-book which resembled the later text-books of political economy. The numerous writings of the school were collected and published in 1844 by Eugène Daire under the title, *Œuvres des Physiocrates* (2 vols.) and *Œuvres de Turgot* (2 vols.). Before that time, in 1768-69, a collection of these writings had been published in six volumes by Dupont de Nemours. The collection was entitled *Physiocratie, ou constitution naturelle du gouvernement plus avantageux au genre humain*.

Despite many differences in details, these writers all agree in the essentially fundamental principles and doctrines. The especially noteworthy works are, *Tableau Économique*, by Quesnay (1758), and an essay by Turgot, entitled *Réflexions sur la formation et la distribution des richesses* (1766).

PIECE-WORK is work done or paid for by the quantity or piece. This is the usual system in many trades, especially in tailoring and shoemaking, in almost all trades producing personal wear, in printing, etc. Mr. Mundella said, in 1876, that 90 per cent. of production was piece-work. This is probably not true to-day. Certain trades, where many men have to work together in one operation, scarcely admit of piece-work. Says Professor Marshall (*Economics of Industry*, p. 393) :

"The system of piece-work is seldom found in the finest and best of industrial relations. The most careful and artistic work can seldom be measured by it; and in many trades, especially small trades, the work varies so much from bench to bench, and from day to day, that no regular tariff can be devised; and piece-work degenerates into contract work, in which the in-

**Agriculture
and
Taxation.**

dividual workman has to bargain alone with his employer.

"But in the majority of trades, the various tasks can be graded accurately; and when a list of prices for them is agreed on, the employes grade themselves, and yet present an unbroken phalanx in bargaining with their employers. Piece-work adds to the wages of the industrious workers, and it checks those habits of half-hearted work which flourish in every rank of life where the soil is favorable."

Workmen, however, have learned by experience not to take so favorable a view of piece-work. Professor Marshall says (*idem*, p. 394):

"In some cases this is caused by an undue eagerness of certain employers to reduce piece-work rates when they have thought their men were taking too much money home. Some workmen oppose it because they desire to take things easily, and have perhaps a latent dislike to be graded according to their merits. And some oppose it because they think it makes work scarce, by inducing men to get through more of it than they otherwise would; and here again come in the combined effects of a little trade-selfishness and the fallacy of the fixed Work-Fund. Perhaps these imperfections of human nature, rather than unionism, are further to be held responsible for whatever ground there may be for the complaint that some unionists urge their fellows not to exert themselves over-much, and absorb work that others might be glad to do. This is not effected by general regulations; but in some workshops, unionist and non-unionist alike, social pressure is brought to bear on any one who works so hard as to set a standard of work higher than the others like; and no doubt the presence of a union element may increase this pressure."

Workmen, however, claim that this effort, not to allow any one to work too hard, is due not to any dislike of work, but to the necessity under present conditions of making a job go as far as it can, employ as many men as possible, and be paid for as highly as possible. It is an inevitable result of the present system. Says Mr. George Gunton (*Wealth and Progress*, p. 180):

"Workmen agree among themselves not to do more than a certain quantity of work, because repeated experience has taught them that if they do, their wages will soon be proportionately reduced. That is why, in some trades, the unions forbid the men to produce more than a given quantity per day, which is so bitterly denounced as one of the injurious features of trades-unions. This practise is adopted the most when new kinds of work or new machinery are introduced, in order to keep the price 'per piece' as high as possible."

Why rapid work reduces wages Mr. Gunton explains. He shows that wages depend on what it costs the working man to live according to the standard of comfort of his class. He cannot long get more than this, because, if he does, some other workmen will offer to work at this standard of comfort price and, under competition, the employer will be compelled to employ him, since the competition compels him, in order to sell cheap, to hire the cheapest labor which can produce a given quantity and quality of work. Hence, if, either by day-work or by piece-work, workmen are seen to be earning more than the standard of comfort wages, the employer not only usually does cut down the wages, but is usually compelled to cut them down. Hence competition prevents working men from long earning in any system wages above the standard of comfort, and rapid work lowers their wages. Says Mr. Gunton (*idem*, p. 181):

"Although this law has never been understood, it has always been implicitly obeyed. Consequently,

wherever the wages system prevails, whether the price of labor is fixed by royal proclamation, statute law, or competition, we find the rate of wages tends to conform to the cost of living, and the price of 'piece-work' to the rate of wages for 'day-work.' . . .

"Accordingly, in the various statutes regulating wages in England from the fourteenth to the eighteenth centuries, we find the price fixed for 'piece-work' always sustained a uniform relation to that of 'day-work.' For instance, threshing a quarter or mowing an acre of wheat was always regarded as a day's work. Hence, in the thirteenth century, when harvest wages were *ad*, a day, the price of mowing an acre or threshing a quarter of wheat was *ad*. . . . also. During the same period, when artisan wages were $\frac{3}{4}$ *ad*, a day, the price for a pair of sawyers to saw 100 planks—which was always reckoned a day's work—was *ad*. . . .

"So when wages rose after the rise in prices in the sixteenth, seventeenth, and eighteenth centuries, the price of 'piece-work' always rose correspondingly with that of 'day-work.' Thus, in 1651, when the Essex magistrates fixed the wages of common laborers at *1s.* and *2d.* a day, the price of sawing 100 planks was fixed at *2s.* and *6d.* or *1s.* and *4d.* for each sawyer. And if we compare the price paid for 'piece-work' in the same industries in different countries or localities where similar methods of production are employed, we shall find that the rate paid will vary according to the difference in the cost of living. . . .

"Again, in manufacturing industries, where machinery is extensively used and 'piece-work' is the general practice, although the average wages keep pace with the average cost of living, the price of 'piece-work' always varies inversely with the productive capacity of the machinery. In the cotton industry evidence of this fact is constantly in view. Through the changes in machinery, which are mostly gradual, it sometimes happens that two kinds of machinery (the new and the old) are in use in the same factory, and very often in the same locality, at the same time, and accordingly we frequently find two different prices paid for the same work in the same town, and even in the same establishment—not a different rate of wages, but a different scale of prices, in order to equalize the rate of wages. And sometimes, in order to avoid two scales of prices for the same work, one will be put on 'day-work,' the rate of wages being fixed upon the average earnings of the other. In fact, this is the general practise on new machinery, until its productive capacity is correctly ascertained, after which the scale of prices is fixed accordingly."

"I have, myself, seen three different prices paid for weaving the same cloth in the same room, all because it was woven in different kinds of looms. For example, a 50-inch loom will not run as fast as a 30-inch loom—*i. e.*, the shuttle will not, *ceteris paribus*, pass as many times a minute across a 50-inch space as it will across a 30-inch space. While the former to-day will run at the rate of from 130 to 150 picks a minute, the latter will average from 180 to 200 picks a minute. It will thus be seen that when 30-inch cloth is woven in 40 or 50-inch looms, the weavers on the broad looms cannot weave as many yards per day as those on the narrow looms; hence a higher price per cut is always paid for weaving narrow cloth in broad than in narrow looms."

"If we examine the shoe-trade we find the same unvarying law obtains; and while the average wages of shoemakers have grown in a direct ratio with the cost of living, the price per pair for making shoes has grown less and less in proportion as improved machinery has been adopted. The same is strikingly true in the watch and jewelry business."

The price of piece-work for pivoting, burnishing, gilding, fitting, casing, etc., through the use of improved tools and machinery, is in many instances from 50 to 75 per cent. less than it was formerly. Still, the real wages in these industries are not reduced, the price of 'piece-work' being lessened only in proportion as the capacity to produce is increased. But while wages never rise in the same proportion with the increased power of production, the price of commodities always falls in that ratio; consequently, though the nominal wages of watchmakers, jewelers, shoemakers, and weavers are not proportionately higher, the prices of watches, jewelry, cotton-cloth, and shoes are relatively lower. This explains the fact that the direct and immediate effect of improved machinery is always more strikingly seen in lower prices than in higher wages, all of which is in strict accord with the

History.

Present Facts.

doctrine that the price of labor always moves in direct ratio with the cost of living, and that of commodities in direct ratio with the cost of production.

"It will thus be observed that wherever we go or to whatever industry we turn our attention, we find that the price of labor, either under 'piece-work' or 'day-work,' is ultimately governed by the same law. Manifestly, therefore,

"Whether laborers work by the piece or work by the day,
The cost of their living determines their pay."

The above principles are well illustrated by the following table as to the actual prices paid by day-work and piece-work in Massachusetts and Great Britain. The table is taken from the Sixteenth Annual Report of the Massachusetts Labor Bureau (1885, p. 113). It will be seen that in these industries in both Massachusetts and Great Britain, piece-workers receive less average weekly wages than day laborers.

GENERAL AVERAGE WEEKLY WAGE PAID TO DAY, PIECE, AND DAY AND PIECE EMPLOYEES.

Piece hands.....	21	9.85	9	7.17
Day and piece hands.....	5	9.69	9	6.01

There can be no questioning these facts. Hence workmen have learned that by working fast they do not *permanently* increase their pay, but soon find themselves producing more, working faster, and employing fewer men, while their wages are not higher. They do find, however, that wages rise by making labor more costly.

The best and most intelligent workmen therefore do not favor piece-work; it is usually the more ignorant though quick new workers who sometimes favor it, because *for a while* it seems to enable them to earn more; a gain, however, soon to be lost when the employer lowers the wage to bring it down to the level of earnings *necessitated* by the competition of the market.

Piece-work too often makes the worker scant his work and sacrifice quality to quantity. Nevertheless, in many trades it prevails, because employers usually favor it, since it enables them to get more work for the same pay, and because in many trades, where quantity counts for more than quality, it is a convenient form of payment.

PINGREE, HAZEN S., the well-known reform mayor of Detroit, was born on a farm in Maine in 1842. In 1856 he went to serve his time in a Massachusetts shoe factory, but when 20 years old enlisted and served through the

whole War of the Rebellion, spending six months as a prisoner of war at Andersonville. At the close of the war he went to Detroit and found work in a shoe factory, but after a time started a small factory of his own, and, with keen business instincts and sterling honesty, worked his way to wealth, owning the largest shoe factory west of New York. He traveled and showed culture and refinement. In 1889 there was great dissatisfaction in Detroit, owing to municipal corruption and mismanagement. Mr. Pingree was asked to stand for the mayoralty and finally consented to do so, tho up to this time he had taken little interest in politics. He threw his energy into the campaign and was elected by a majority of 2318. Altho a Republican, he immediately subordinated partizan politics to the public good, and with indomitable energy began to run the city on business principles. Finding himself opposed by a corrupt council and private companies who, for a song, could buy whatever franchises they wanted, he commenced to fight them. In his first message he announced that the time had come for the city to control its own public lighting. The companies fought him in the courts and in every way; sometimes retaining all the able lawyers, so that the mayor had to seek elsewhere for legal advice. The council was more than once ready to pass over his veto an ordinance giving the electric lighting and other privileges to private corporations. Mr. Pingree boldly accused them of venality and was ready to give names, and at last terrified them into submission. In his message for 1896 he says:

"Another cause for congratulation on the part of the city lies in the successful completion and operation of the public lighting plant, by which the cost of public lighting has been reduced from \$11.15 to \$7.20 per arc lamp. The city has been lighted for three months by this plant, and during that brief period has saved the city \$18,961.60, with first-class service.

In his battle with the railway companies he has not been able yet to gain municipal ownership, because it needs a change of charter, and the legislature is too much controlled by the companies; but after a prolonged fight he has brought a new corporation to Detroit to battle the old ones, and has gained for a portion of the city 3-cent fares, and now proposes to accept a proposition made by the Detroit Railway to operate all the tracks of the city at 2½ cent fares, with universal transfers, the company to pay interest on the purchase price of the tracks. He has also fought the gas companies and early secured a reduction of their rates from \$1.50 to \$1, with a prospect of still further reduction. Very widely known is his potato-patch scheme, through which, in the hard times of 1894, he was successful in relieving the unemployed. (For an account of this, see Detroit Plan.) He has also fought for free water, direct legislation, a general adoption of the eight-hour day and other reforms. He has written a popular book, *Facts and Opinions; or, Dangers that Beset Us*. In 1896 he was elected Governor of Michigan on the Republican ticket.

PINKERTONS, THE.—In 1852 Allan G. Pinkerton, a Scotchman, who, having become involved in the Chartist outbreak in Birmingham, had emigrated to the United States, and here having from love of adventure secured the arrest of a band of counterfeiters, had been appointed deputy sheriff, established in Chicago a detective agency. His agency was very successful, and during the War of the Rebellion Mr. Pinkerton superintended the secret service of the army. Later, in the labor troubles in Pennsylvania, his agency was employed against the Molly Maguires. Henceforth, the Pinkerton agency was employed more and more by employers to defend their works from threatened violence on the part of mobs rising in connection with strikes. They became bitterly hated by working men. The working men claimed the Pinkertons did more than protect the property of their employers. They claimed that the agency went into the slums of the great cities, hired desperadoes and men of the worst character, swore them in as special detectives, and then sent them not only to protect the property of employers, but to incense the populace and provoke it to violence, then firing upon the populace on the least provocation. The working men claimed that the Pinkertons created more evil than they allayed. Stories were circulated of the Pinkertons secretly doing violence themselves, laying it to working men, and then firing on them. Finally, when, at the great Homestead strike (*q. v.*), Pinkertons in large numbers and armed with rifles were marched to Homestead, the working men rose and repulsed them as they would an invading army. Working men claim that the duty of protecting property should be left to the police; that if these are not sufficient, the army should be called in, but that bodies of reckless armed private mercenaries should not be allowed to fire on citizens. As a result of this popular feeling, Congress appointed a committee to investigate into the employment of such private armed bodies of men, and some States passed bills forbidding such employment. (See STRIKES.)

PLACE, FRANCIS.—A master tailor who played a large and important part in the English labor movement at the beginning of the century. Before setting up a shop of his own at Charing Cross, London, he had worked as a journeyman breeches-maker, and had been active in effecting organizations in his own and other trades. When he set up for himself he was still more active, and after 1818 left the conduct of his business to his son, and devoted himself wholly to the labor movement: first, to the repeal of the combination laws, and second, to the reform movement. He was a pupil of Bentham, a radical individualist, and a shrewd parliamentary lobbyist. As early as 1810 he testified before a select committee of the House against measures proposed by the employers, and in 1814 set himself seriously to overthrow the combination laws (see CONSPIRACIES). Working through a little working-class paper, the *Gorgon*, he gained the support of Joseph Hume and J. R. McCulloch, then editor of the *Scotsman*. Joseph Hume, in the House of

Commons in 1822, gave notice of his intention to bring in a bill repealing all combination laws, but Place really managed the case, marshaled the witnesses, and arranged their evidence. Scarcely realizing what was done, Parliament passed the bill. The employers were now thoroughly roused, and the next year succeeded in partly modifying the bill, though Hume in Parliament, and Place outside, ably fought them at every point. After this Place took less active part in the movement, but has left valuable manuscripts, letters, books, and an unpublished autobiography, which are being worked by Mr. Graham Wallas into a critical biography of this important man. (See *History of Trade-Unionism* by Sidney and Beatrice Webb.)

PLATO (429-347 B. C.) was born in Athens, the year of the death of Pericles. At the age of 20, coming under the influence of Socrates, he chose philosophy for his life pursuit, but was driven from Athens and lived in Sicily, visiting (probably) Italy and Africa. At the age of 40 he was able to return to Athens and establish a school of philosophy, the *Academy*; a beautiful garden, where for 41 years he taught, his greatest pupil being Aristotle. His greatest economic writings are *The Republic* and *The Laws*. The following review of his economic teachings is given in Professor Ingram's *History of Political Economy*. He says :

"The most celebrated of Greek ideal systems is that of Plato. In it the idea of the subordination of the individual to the State appears in its most extreme form. Within that class of the citizens of his republic who represent the highest type of life, community of property and of wives is established, as the most effective means of suppressing the sense of private interest, and consecrating the individual entirely to the public service. It cannot perhaps be truly said that his scheme was incapable of realization in an ancient community favorably situated for the purpose. But it would soon be broken to pieces by the forces which would be developed in an industrial society. It has, however, been the fruitful parent of modern Utopias; specially attractive as it is to minds in which the literary instinct is stronger than the scientific judgment, in consequence of the freshness and brilliancy of Plato's exposition and the unrivaled charm of his style. Mixed with what we should call the chimerical ideas in his work, there are many striking and elevated moral conceptions, and, what is more to our present purpose, some just economic analysis. In particular, he gives a correct account of the division and combination of employments, as they naturally arise in society. The foundation of the social organization he traces, perhaps too exclusively, to economic grounds, not giving sufficient weight to the disinterested social impulses in men which tend to draw and bind them together. But he explains clearly how the different wants and capacities of individuals demand and give rise to mutual services, and how, by the restriction of each to the sort of occupation to which, by his position, abilities, and training, he is best adapted, everything needful for the whole is more easily and better produced or effected. In the spirit of all the ancient legislators he desires a self-sufficing State, protected from unnecessary contacts with foreign populations which might tend to break down its internal organization or to deteriorate the national character. Hence he discountenances foreign trade, and with this view removes his ideal city to some distance from the sea. The limits of its territory are rigidly fixed, and the population is restricted by the prohibition of early marriages, by the exposure of infants, and by the maintenance of a determinate number of individual lots of land in the hands of the citizens who cultivate the soil. These precautions are inspired more by political and moral motives than by the Malthusian fear of failure of subsistence. Plato

aims, as far as possible, at equality of property among the families of the community which are engaged in the immediate prosecution of industry. This last class, as distinguished from the governing and military classes, he holds, according to the spirit of his age, in but little esteem; he regards their habitual occupations as tending to the degradation of the mind and the enfeeblement of the body, and rendering those who follow them unfit for the higher duties of men and citizens. The lowest forms of labor he would commit to foreigners and slaves. Again, in the spirit of ancient theory, he wishes (*Legg.* v. 12) to banish the precious metals, as far as practicable, from use in internal commerce, and forbids the lending of money on interest, leaving indeed to the free will of the debtor even the repayment of the capital of the loan. All economic dealings he subjects to active control on the part of the Government, not merely to prevent violence and fraud, but to check the growth of luxurious habits, and secure to the population of the State a due supply of the necessaries and comforts of life."

PLUTOCRACY (Gr. *πλοῦτος*, wealth, and *κρατεῖν*, to rule) is the rule of wealth, or government by the wealthy class. (For the principles involved, see STATE.) We consider here the facts as to the rule of wealth in the United States. Many believe this to be the danger to-day most threatening the public weal. We therefore consider it at no little length, collecting the testimony only of responsible men and careful students, rigidly excluding all common gossip or careless exaggeration. We commence with a few general judgments from leading men.

Bishop H. C. Potter of New York, in his address on the anniversary of Washington's Inaugural, April 30, 1889, spoke freely of the danger to our political institutions from amassed fortunes and alluded to "the growth of wealth, the prevalence of luxury, the massing of large material forces, which by their very existence are a standing menace to the freedom and integrity of the individual."

Says the Rev. Josiah Strong, D. D. (*Our Country*, pp. 166-168):

"It is useless for us to protest that we are democratic, and to plead the leveling character of our institutions. There is among us an aristocracy of recognized power, and that aristocracy is one of wealth. No heraldry offends our republican prejudices. Our ensigns armorial are the trade-mark. Our laws and customs recognize no noble titles; but men can forego the husk of a title who possess the fat ears of power. In England there is an eager ambition to rise in rank, an ambition as rarely gratified as it is commonly experienced. With us, aspiration meets with no such iron check as birth. A man has only to build higher the pedestal of his wealth. He may stand as high as he can build. His wealth cannot secure to him genuine respect, to be sure; but for that matter, neither can birth. It will secure to him an obsequious deference. It may purchase political distinction. It is power. In the Old World, men commonly live and die in the condition in which they are born. The peasant may be discontented, may covet what is beyond his reach; but his desire draws no strength from expectation. Heretofore, in this country, almost any laborer, by industry and economy, might gain a competence, and even a measure of wealth; and, tho now we are beginning to approximate the conditions of European labor, young men, generally, when they start in life, still expect to become rich; and, thinking not to serve their god for naught, they commonly become faithful votaries of Mammon. Thus the prizes of wealth in the United States, being at the same time greater and more easily won, and the lists being open to all comers, the rush is more general, and the race more eager than elsewhere. . . . And, while Mammonism corrupts morals, it blocks reforms. Men who have favors to ask of the public are slow to follow their convictions into any unpopular reform movement. They can render only a sur-reptitious service. Their discipleship must needs be

secret, 'for fear of the' customers or clients or patients. It is Mammonism which makes most men *invertebrates*. When important Mormon legislation was pending, certain New York merchants telegraphed to members of Congress: 'New York sold \$12,000,000 worth of goods to Utah last year. Hands off!'

As long ago as 1871 Charles Francis Adams, since himself president of a great railroad organization, wrote (*Chapters on Erie*):

"The system of corporate life and corporate power, as applied to industrial development, is yet in its infancy. It tends always to development, always to consolidation; it is ever grasping new powers or insistently exercising covert influences. Even now the system threatens the central government. . . . The belief is common in America that the day is at hand when corporations far greater than ever,—swaying power such as has never in the world's history been trusted in the hands of mere private citizens, controlled by single men like Vanderbilt, or by combinations of men, like Fiske, Gould, and Sage,—after having created a system of quiet but irrepressible corruption, will ultimately succeed in directing government itself. . . . It is a new power for which our language contains no name. We know what aristocracy, autocracy, democracy are, but we have no word to express 'government by moneyed corporations.'"

A very recent utterance is the address of Justice Henry B. Brown of the United States Supreme Court, before the law school of Yale, in June, 1895. He said in his address:

"The I am unwilling to believe that corporations are solely responsible for our municipal misgovernment, the fact remains that bribery and corruption are so universal as to threaten the very structure of society. Universal suffrage, which it was confidently supposed would inure to the benefit of the poor man, is so skillfully manipulated as to rivet his chains and secure to the rich man a predominance in politics he has never enjoyed under a restricted system. Probably in no country in the world is the influence of wealth more potent than in this, and in no period of our history has it been more powerful than now."

Judge William J. Gaynor of the New York Supreme Court, writing to the St. Louis Mercantile Club a letter for Jefferson Day, 1895, says:

"The untold millions of sham, dishonest, and oppressive paper stock and bonds now existing in this country, issued generally upon rights and privileges conferred by law gratuitously, and to pay dividends and interest upon which it is proposed to sap agricultural, mechanical, manufacturing, mercantile, professional, and all other honest industry, may well be the subject of grave thought by those who meet to recur to and keep alive principles which are wholly antagonistic to such a condition, and which cannot be said to be paramount while such a condition exists."

It is true that the New York *Evening Post* ridicules Judge Gaynor's alarm as an hallucination, and says:

"The fact is that plutocrats are so scarce that one may travel five hundred miles without seeing or hearing one. . . . So far, too, from the 'oppressive paper' sapping the honest industry, it is the honest industry which saps the oppressive paper. Oppressive paper rarely pays more than half a year, while it is honest industry which carries the country along and makes the world go round."

The *World*, however, answers the *Evening Post*, and says:

"What influence was it except the money of the Sugar Trust operating in the Senate which thwarted the purpose of the great majority of the House of Representatives and reestablished an odious sugar tax? Was not the successful hold-up of the Wilson bill in the Senate an example of the domination of a republic by plutocrats? Or, take the beef trust, the coal trust, the oil trust, as they rule the market and rob the people to-day—what is their power except

the towering tyranny of combined capital? The power arbitrarily to fix the prices of great staples, and successfully to defy laws enacted to restrain such combinations, comes painfully near to absolute supremacy. The man who buys a piece of pork or a barrel of oil or a ton of coal does not find plutocracy a 'hallucination.' How many senators of the United States owe their seats directly to the use of money? Are there not enough such to hold the balance of power in that body and so to control legislation?"

Says Professor R. T. Ely (*Problems of To-Day*, p. 210):

"Our Federal, State, and local governments are now controlled by men who hold their offices in trust for powerful private parties, and they view public measures not from the standpoint of the general public, but from the standpoint of those in whose employ they are. . . . One proof of this is the way in which legislative favors are exchanged. . . . The lobbies which exist everywhere are further proof. These are maintained to instruct legislators in regard to private interests and to make it worth while for them to help forward some schemes for plundering the people. Again and again have citizens found it an absolute impossibility to secure any attention for measures designed simply to benefit the general public. Legislatures and city councils will not even take time to give them superficial attention" (*Problems of To-Day*, pp. 210-211).

The opinion that Democracy is a failure is growing in the United States. Says a Michigan Supreme Court decision:

"Indeed it is doubtful if free government can long exist in a country where such enormous amounts of money are allowed to be accumulated in the vaults of corporations, to be used at discretion in controlling the property and business of the country against the interest of the public" (*Michigan State Reports*, vol. lxxvii. p. 632).

Not all, however, admit the danger from plutocracy. Papers like the New York *Evening Post* deny that it is a wide-spread evil, while some writers even excuse the buying of legislation. They argue that when a rich man meets a highwayman and is compelled to surrender his purse, **Defense of Corporations.** no one calls it a corrupt proceeding on the part of the rich man. So, they say, corporations go to the legislature for legitimate legislation—legislation for the good of the whole community—legislation without which commerce could not prosper, yet they are met at the door by corrupt and venal political highwaymen, who compel them to pay or not get their legislation. The fault, such writers say, is not with the corporations, but with the voters who elect highwaymen to office. Mr. Hudson, who cannot be accused of overpartiality to corporations, reminds us in his *Railways and the Republic*, that if any corporations, with an exceptional and miraculous scrupulousness, should abstain from these methods, it would be crowded out of existence by the competition of its less scrupulous rivals. Of the Senators said to represent railway interests he says:

"It is not fair to say that these men deliberately choose to serve their corporate interests rather than the nation in public office. Many of them believe that the interests of the railways are the public interests. Their habits of life, their associations, their business training, their success in the service of the corporations, and, above all, their interests support that belief."

Defenders of the present system, therefore, argue that what is the real evil is not plutocracy, but a vitiated public service. The cure they look for lies in the extension of civil-ser-

vice reform, municipal purity, the enforcement of educational qualifications for the suffrage, etc., etc.

After these various general judgments, we consider some detailed facts and evidences of plutocratic perils:

First, we note the constitution of our national legislature and the extent to which the corporations, and not the people, are represented therein. This applies more directly of course to the "millionaire Senate" than the House, but very largely to both. Of the Cabinet we shall speak later. In

Composition of Congress. 1895-97, there are about 88 members (not including the Senators from Utah). Of these 57 are lawyers, 2 are termed capitalists, 1 manufacturer, 2 merchants, 2 railroad presidents, 2 miners, 1 brewer, 1 steamship manager, 1 railroad and coal operator, 1 car builder, 2 bankers. The remaining 15 members out of the 88 are 3 journalists, 4 public officials, 3 farmers, 1 literary man, 1 physician, 1 clergyman, 1 planter, 1 stock grower. In the House, out of 356 members, 228 are lawyers, 14 bankers, 15 manufacturers, 12 merchants, 4 real estate dealers, 2 contractors, 2 capitalists. Of the remaining 79, 27 are farmers, 5 journalists, 5 public officials, 4 planters, 5 physicians, 8 editors, and the rest scattering. With a legislature thus constituted, and realizing whence a successful lawyer today must usually draw his large fees, it is only too evident what must be the character of our legislation. Says Mr. J. F. Hudson in a carefully balanced statement:

"The methods by which corporate interests control political action may be classified broadly in two great divisions. The first includes the election or appointment of representatives of the railways to public courts in which they can serve the corporate interests. The second covers the use of their immense pecuniary resources in downright bribery or indirect influence of those holding such trusts. The first method may involve no direct corruption of the elective or appointing power. The

Forms of Bribery.

method of directly attacking the integrity of the representatives and servants of the people, to secure their adherence to corporate interests, is hazardous and expensive when applied to high departments of government, which are under the constant inspection and criticism of the public. It is, therefore, less frequent, as I am glad to believe, in efforts to influence the action of the national Government than the former plan. But as we go down the scale of political power and prominence, the dangers of exposure decrease, and the frequency of direct or indirect acts of corruption increase rapidly. . . . Hence, bribery by corporations, direct or indirect, is far more frequent in the State legislatures than in Congress, while the same practice in municipal bodies may be said to be general. It is a contribution to the maxims of corruption, by one of the lights of the lobby management in Pennsylvania, that it is cheaper to buy representatives or delegates after they are elected than to elect the men wanted."

Yet how much money is spent by corporations in elections is well known. Mr. James Bryce (*American Commonwealth*, vol. ii., third edition, pp. 613-614) refers to "the large subscriptions and promises of political support" made by the wealthy to national parties to procure or prevent legislation. He says:

"Plutocracy used to be considered a form of oligarchy, and opposed to democracy. But there is a strong plutocratic element infused into American

democracy; and the fact that constitutions ignore differences of property, treating all voters alike, makes it neither less potent nor less mischievous. . . . In the United States the money power acts by corrupting sometimes the voter, sometime the juror, sometimes the legislator, sometimes a whole party. The enormous amounts of money spent in great city elections like those of New York City, and which sometimes turn national elections, is well known.

Mr. W. M. Ivins, city chamberlain of New York, in an address before the Commonwealth Club of that city, as reported in *The Nation* for March 3, 1887, showed an ordinary city election to cost the enormous sum of \$1,283,000. He showed that in November, 1886, the city paid \$222,500 for 4872 officers on duty at the polls, besides \$68,500 for Federal marshals. Besides this various political leaders drew, nominally as salaries but really to keep themselves in power, \$330,000, an average of \$4750 apiece. To this Mr. Ivins adds \$750,000 paid in one way or another for hangers-on, heelers, etc., and \$291,000 for the legal machinery of elections, making it give a grand total of \$1,283,000.

Money in Elections.

To meet this, he says, the candidates are assessed as follows:

Mayor (for 3 machines).....	\$25,000-30,000
Supreme Judge (for 2 or 3 machines)....	10,000-20,000
Superior Judge (for 2 or 3 machines).....	10,000-15,000
Common Pleas (for 2 or 3 machines).....	10,000-15,000
Register.....	15,000-40,000
Comptroller.....	10,000
Sheriff.....	10,000
County Clerk.....	10,000
District Attorney.....	5,000
Congress.....	5,000-10,000
State Senator.....	5,000-10,000
Assembly.....	500-1,000

Allowing two candidates for each office, this makes, Mr. Ivins calculates, \$211,200 assessed from candidates. The average disbursements by all organizations he puts at \$307,000. The balance is paid by contributions from the wealthy and from other interested factors. In the election of 1886 he calculates that 45,475 men were under pay, or one-fifth of the total vote. (See CORRUPTION.)

Whence comes the money to buy these men? In part from the assessments upon candidates.

Said Charles Francis Adams in 1871:

"The existing coalition between the Erie Railway and the Tammany Ring is a natural one, for the former needs votes, the latter money."

We come now to consider some typical illustrations of the power of plutocracy. Mr. Hudson says (*Railways and the Republic*):

"The most conspicuous of all is the complete control which a great corporation has had for 20 years or more over the State of Pennsylvania. The old joke of moving to adjourn the legislature of that State 'if the Pennsylvania Railroad has no more business for this body to transact' dates from the early stages of corporate development; but hardly a legislature has convened in that State for many years in which it would have been felt to be pointless. With one brief spell of legislative independence, the laws of the commonwealth, as far as that corporation has any interest or claim, have been made by its managers and registered by the legislature. . . . John D. Lawson, in his work, *Leading Cases Simplified*, referring to the decision in the case of *Thorogood vs. Bryan*, says: 'The American courts decline to follow it, except in Pennsylvania. Here, perhaps, is the place to warn the student, so far as the law of carriers is concerned, not to pay much heed to the decisions of the Supreme Court of Pennsylvania, at least during

Pennsylvania Railroad.

the past 10 or 15 years. The Pennsylvania Railroad appears to run that tribunal with the same success that it does its own trains.' . . . This corporate supremacy through the Republican party in one State finds a parallel in another State under Democratic ascendancy. The power of the Standard Oil Company in the Democratic Legislature of Ohio has been

Standard Oil Monopoly.

asserted in the election of a United States Senator and in the defeat of the bill to give competing refineries equality in pipe-line transportation with that monopoly. It has been charged that wholesale bribery was used to secure these results. Such charges by political opponents might not command belief, altho the persistent refusal to investigate them is suspicious. But the Democratic agent of the bribery has acknowledged it. During the last session of the body stigmatized by its partizan opponents as 'the coal and oil legislature,' the legislative agent of the 'ring' which is credited with its control appeared on the floor in a state of gross intoxication. The offense was too public and notorious to be overlooked, and a committee was appointed to enforce discipline. Before the committee had begun its work, the offender declared that the House dared not discipline him; that he had paid too many members for their votes; that he had a list of those that had been purchased; and that, if he were punished for his behavior, he would expose a majority of that body as having accepted bribes. The excitement was great; the challenge was accepted; he was called before the committee and asked for the list. He then retracted his charge and all further proceedings against him for his outrage upon the rules of the House was quietly dropped. . . . This was in the State legislature. It was, however, carried to Congress."

Mr. H. D. Lloyd, in his *Wealth vs. Commonwealth*, thus states this portion of the narrative. We abridge his account:

Both houses of the Ohio legislature forwarded formal charges of bribery to the United States Senate and appealed for an investigation. It was not granted, tho it had been the invariable custom of the Senate to grant such investigations, and Senator Sherman, the other Senator from Ohio, had declared that he agreed with every word of the appeal

Election of Mr. Payne.

and that it was the belief of a very large majority of the people of Ohio that the election was bought. Mr. Payne, the Senator whose election was declared to have been bought, did not deny the facts. He simply denied that he had spent any money for his election and offered to show his private papers. But that was not the accusation. The Committee on Privileges and Elections recommended (Senators Pugh, Saulsbury, Vance, and Eustis voting against Senators Hoar and Frye) against investigation. In the debate on the adoption of the majority report Senator Hoar said: "The adoption of this majority report . . . will be the most unfortunate fact in the history of the Senate." In the minority report he had declared that refusing to investigate would show that the Senate "is indifferent to the question whether its seats are to be in the future the subject of bargain and sale, or may be presented by a few millionaires as a compliment to a friend." When the majority report was adopted, Senator Edmunds is said to have turned to his neighbor in the Senate and to have said: "This is a day of infamy for the Senate of the United States."

But the Standard Oil Monopoly and its friends could be represented in the Cabinet as well as in the Senate. In December, 1892, the Secretary of the Treasury decided that the oil combination should be paid a drawback for the duties it had paid on imported steel hoops. "It isn't pleasant," said the *New York World* editorially, February 23, 1891, "to have a Secretary of the Treasury who holds intimate relations with the oil trust." Through the Secretary of the Navy, too, the company of the International Line of Atlantic steamers, whose president is also president of the pipe-line branch of the oil trust, got various favors; Congress granting them the monopoly

Further Influence.

of carrying the mails for 10 years from 1895 and a subsidy of \$1,354,496 a year on investment of not over \$10,000,000 on the part of the company. The Secretary of the Navy urged the bill upon the naval committees of Congress. It was to help American

commerce, but the company by especial vote was allowed to raise the American flag on two English-built steamers, and the Secretary of the Treasury later excused the company from obeying, as to its engineers, the requirements of the bill that its officers be Americans. Patriotism was appealed to to carry the bill through, but when it had been voted patriotism was dropped. The same Secretary of the Navy got through the closing hours of the Congress of 1889-90 a bill appropriating \$1,000,000 for nickel ore to be purchased by the Secretary of the Navy when and where he would. Duty was to be taken off the ore, and it could thus be bought at Sudbury, Canada, the only nickel mine of importance in Canada and a mine alleged to be owned by the oil combination. The Postmaster-General, who stands between the United States and the subsidized company that carries its foreign mails, is one of the firm of counsel that defended some of the owners of the company in their trial at Buffalo for blowing up a rival oilworks. (See STANDARD OIL MONOPOLY.) It is little wonder that Senator Hoar during the debate as to Mr. Payne, asked if the trust was represented in the Cabinet as well as in the Senate. For still other charges against the trust, see STANDARD OIL MONOPOLY.

Nor must it be thought that these notorious scandals are the only ones. Says Mr. Hudson:

"Such practises are not peculiar to railway corporations. They occur to a greater or less degree in the political relations of water corporations, electric companies, gas companies, telegraph companies, and even manufacturing companies, where their opportunities for profit can be affected by the exercise of governmental power. The railways are the greatest and most powerful of all these organizations, because their interests are most directly affected by legislation and by public administration. But the nature of corporate influence on politics is always the same. The sole aim is pecuniary profit; the impersonal character removes all limitations of conscience. . . . A striking picture of the methods of the corporations in dealing with legislation in that State [New York] was furnished by the testimony of Mr. Jay Gould. . . . Mr. Gould artlessly says: 'We were Republicans in Republican districts, and Democrats in Democratic districts, but always for the Erie Railway.' The companion picture furnished by the Huntington letters, published last year, throws new light on corporate lobbying in Congress. Here in the confidence of private correspondence, we learn from the railway kings how some statesmen serve the corporations under the pretense of opposing them; how editorial opinions in leading journals are a good investment for the corporation fund; how unsuspected lobby agents are set to work, apparently without concert, but under secret orders from one head; how, in short, the unlimited resources of great corporations employ all that is unscrupulous, wily, disreputable, and dangerous in politics to attack members in their weak points, to flatter, bribe, and control them so that they must support the corporations. . . ."

Ordinary Corporations.

Professor E. W. Bemis, at that time of the University of Chicago, in a paper before the National Convention for Good City Government held in Minneapolis, December, 1894, tells of a corporation voting \$100,000 to buy the Chicago city council as calmly as it would vote to buy a new building, and says that, according to a reliable attorney's information, such is an ordinary proceeding.

Another most serious sign of the growth of plutocracy is the extent to which great corporations openly and flagrantly violate the laws that are passed. Says Mr. Hudson (*Railways and the Republic*, pp. 324-325):

"It is a humiliating confession to make, and one which shows the magnitude of the power with which legislation must measure its strength, that the constitutional prohibitions of a dozen States, traversed by great railway lines, against discriminations, rebates, the consolidation of competing lines, the granting of free passes, and other practises are practically waste paper.

The constitutions of California and Pennsylvania are striking illustrations. Their language is clear, and strong enough, if enforced, to prevent nine-tenths of the abuses which unregulated railways practise. Yet in California the rule of the Central Pacific Railway over commerce is unlimited. The commissioners provided for in the Constitution are expensive figure-heads, and the Constitution as a restraint upon that great corporation is a dead letter. In Pennsylvania a similar result has been obtained by the success of the Pennsylvania Railroad in preventing legislation to give effect to the Constitution."

Mr. Lloyd gives us some of the details of this. He says (we abridge his account):

"Pennsylvania in 1873 adopted a new constitution. By its common carriers were forbidden to mine or manufacture articles for transportation over their lines or to buy land except for carrying purposes. The Constitution has been defiantly ignored by the railroads. Says the report of Congress of 1888, 'the railroads have defiantly gone on acquiring title to hundreds of thousands of acres of coal as well as of neighboring agricultural lands.' They have been 'aggressively pursuing the joint business of carrying and mining coal.' So far from quitting it they 'have increased their mining operations by extracting bituminous as well as anthracite' (Report, p. 13). The legislature has aided them, and has passed laws to nullify the Constitution by preventing forever any escheat to the State of the immense area of lands held unlawfully by the railroads."

In Pennsylvania.

Mr. Lloyd adds another illustration of the way corporations evade the law:

"In 1837 Congress passed the Interstate Commerce Law, and established the Interstate Commerce Commission, to enforce justice on the railroads. The independent miners of Pennsylvania appealed to it against the railroads. Two years and a half were consumed in proceedings. Then the commission ordered the roads to reduce their rates. It was never done. In 1893 Congress found their rates to be 50 cents a ton higher than what the commission required. The Interstate Commerce Law provides for the imprisonment in the penitentiary of those guilty of the crimes it covers. The only conviction had under it has been of a shipper for discriminating against a railroad" (H. D. Lloyd's *Wealth Against Commonwealth*, p. 19).

"Railroads like the Pennsylvania Railroad simply laugh at the Interstate Commerce Commission. September 3, 1888, all the trunk railroads advanced their rates on barrels of oil, and claimed that this rise was forced upon them by the commission. The commission protested that that was not according to their decision. 'I did not consider it in that way,' answered one railroad official. 'That was their (the commission's) view of the case, but it was not shared by us.' 'It was considered best to continue the practise,' said the president of the Pennsylvania Railroad (Testimony Titusville and Oil City, Independents' cases, p. 462-542). Said Wendell Phillips: 'There is no power in one State to resist such a giant as the Pennsylvania road. We have 38 one-horse legislatures in this country, and we have a man like Tom Scott with \$350,000,000 in his hands, and if he walks through the States they have no power.'"

Interstate Commerce Act.

The president of the sugar trust, before a special committee of the United States Senate, testified that this "politics of business" was the custom of "every individual and corporation and firm, trust or whatever you like to call it" (Senate Report No. 485, Fifty-third Congress, second session, June 21, 1894). Asked if he contributed to State campaign fund, said: "We always do that. . . . In the State of New York, when the Democrat majority is between 40,000 and 50,000, we throw it their way. In the State of Massachusetts, when the Republican party is doubtful, they probably have the call. Wherever there is a dominant party, wherever the majority is very large, that is the party that gets the contribution, because that is the party which controls local matters" (Supplemental Report of Senator W. V. Allen

Prevalence of Corruption.

of the Senate Special Committee (ordered May 17, 1894) to investigate alleged attempts at bribery by the sugar trust).

In regard to the relation between government and the monetary and banking interests of the country, it is to be said that the power of plutocracy is probably more marked here than in any other quarter. Yet the very extent to which the monetary legislation and policy of the United States has been dominated by, and certainly on occasion actually corrupted by, the great monetary interests, has led to so many unreliable current reports upon the point, as to make general statement appear to endorse some detailed statements, that cannot be supported, while to say little would not do justice to the extent of this gigantic form of plutocratic power. We therefore refer the subject to the article, *Silver Question*, where it will be carefully treated at the length it demands. We simply print here one quotation from a report of a United States Comptroller of the Currency, which shows that from war times, if not before, the money power has played a large and most criminal part in our monetary legislation.

Mr. Hugh McCulloch, when Comptroller of the Currency, said, in his second report:

"Hostility to the Government has been as decidedly manifested in the effort that has been made in the commercial metropolis of the nation to depreciate the currency as it has been by the enemy in the field, and unfortunately the effort of sympathizers with the rebellion and of the agents of the rebellious States to prostrate the national credit has been strengthened and sustained by thousands in the loyal States whose political fidelity it might be ungenerous to question. Immense interests have been at work all over and concentrated in New York to raise the price of coin, and splendid fortunes have been apparently made by their success. . . . Gold has been a favorite article to gamble in. . . . The effect of all this has been, not to break down the credit of the Government, but to increase enormously the cost of the war and the expense of living; for, however small may have been the connection between the price of coin and our domestic products, every rise of gold, no matter by what means effected, has been used as a pretext by holders and speculators for an advance of prices, to the great injury of the Government and the sorrow of a large portion of the people. . . ."

(See also *CORRUPTION*; *STANDARD OIL MONOPOLY*; *SILVER*; *SYNDICATE*; *WEALTH*, Section Concentration of.)

Revised by H. D. LLOYD.

POLICE.—The policeman is far more than a guardian of the public peace. Mr. Thomas Byrnes calls him "the real court of first instance." Says Mr. H. M. Boies (*Prisoners and Paupers*, p. 237):

"Nowhere, probably, on the face of the globe, does what is commonly known as the police force occupy so prominent, important, and influential a position and sphere in the social organization as it does in the United States; nowhere does it sustain so potent a relation to pauperism and crime as here. . . . In the United States, under a social organization for self-government, a government of laws, which are solely the formulated decrees of popular judgment and will, the police and constabulary constitute almost the only incorporate and vital evidence, or general manifestation, of the authority and dignity of government; they represent the concrete absolutism of the laws, and exercise the majesty and power of the people in, among, and before the people constantly. They become, therefore, to the people here, not only the agents and representatives of self-government, but the express force and soul of government, the general and popu-

lar conception of government itself. This increases the power, dignity, and influence of the police officer in this country immeasurably above what exists elsewhere. It is his province here to bring the popular power into direct contact with and control over the people. . . . The police are, in this country, the eyes and ears, as well as the hands, of the body politic; not only the means of governmental apprehension, but of discovery; the agents of prevention as well as of cure. It devolves upon them to observe the very beginnings of error, failure, and sin in society; to note the sources, the inception, and conception of crime and poverty; to watch their birth, growth, and development; to become familiar with causes and occasions, to recognize the necessary remedies. They seldom feel called upon to interfere; indeed, the principle of their action is not to interfere before the overt act, when correction becomes necessary and prevention is no longer practicable. The intimacy and constancy of their contact with society and its elements should enable them to stretch out the helping or the warning hand of government when it could be efficient, when the needed slight change of direction can be given the individual faced the wrong way, before the club, the handcuff, or the lock-up have become necessary. Indeed, an interference which would be resented from a private person, however gently or kindly made, would be received not only without objection ordinarily from the policeman, but it would carry with it the weight and influence of the wisdom and will of society. A word or an act which would make no impression without authority, with it might be effectual in saving many a youth from ruin. If the police then could be enlisted as conservators of morals as well as preservers of the peace, they would become a power in the community of inestimable utility, and the necessities of their harsher activities would be greatly decreased. The task of training the twig is lighter than bending the tree. If they could be made to devote their chief care to the children and youths when they are beyond the parental eye or control, and be placed in a position representing with authority the organized parentage and domesticity of the community outside its homes, upon the streets and in public places, many of the dangers of city life would be alleviated. Their parental functions might be extended for the general benefit to the relief of the poor from suffering, to the ministrations of charity, to the restrictions of intemperance, the arrest of drunkenness, the correction of evil tendencies, and the rescue of those in peril of moral corruption and ruin."

On the other hand, what the police can do for evil is shown by the following account of the political situation in Philadelphia under the control of the old Gas Ring. It is from Mr. Bryce's *The American Commonwealth*, first edition, vol. ii. chap. lxxxviii.

"The possession of the great city offices gave the members of the Ring the means not only of making their own fortunes, but of amassing a large reserve

fund to be used for 'campaign purposes.' Many of these offices were paid by fees, and not by salary. Five officers were at one time in the receipt of an aggregate of \$223,000 (£44,600), or an average of \$44,600 each (£8,900). One, the collector of delinquent taxes, received nearly \$200,000 a year. Many others had the opportunity, by giving out contracts for public works on which they received large commissions, of enriching themselves almost without limit, because there was practically no investigation of their accounts. The individual official was of course required to contribute to the secret party funds in proportion to his income, and while he paid in thousands of dollars from his vast private gains, assessments were levied on the minor employees down to the very policeman. On one occasion each member of the police force was required to pay \$25, and soon afterward a further tax of \$10, for party purposes. Any one who refused, and much more of course any one who asserted his right to vote as he pleased, was promptly dismissed. The fund was spent in what is called 'fixing things up,' in canvassing, in petty bribery, in keeping bar-rooms open and supplying drink to the workers who resort thither, and, at election times, in bringing in armies of professional personators and repeaters from Washington, Baltimore, and other neighboring cities, to swell the vote for the Ring nominees. These men, some of them, it is said, criminals, others servants in the Government departments in the national capital, could of course have effected little if the election officials and the police had looked sharply after them. But those who presided at the voting-places were mostly in the plot, being Ring men and largely city employees, while the police—and herein not less than in their voting power lies the value of a partizan police—had instructions not to interfere with the strangers, but allow them to vote as often as they pleased, while hustling away keen-eyed opponents.

"A policeman is by law forbidden to approach within thirty feet of the voter. Who was to see that the law was observed when the guardians of the law broke it? According to the proverb, 'If water chokes, what is one to drink next?'"

With this view of what the police do or might do—and no one can know anything of police courts (*q. v.*) without seeing how much of responsibility actually lies upon the police, and frequently how utterly ignorantly they carry it out—it becomes necessary to know what is the organization of the police in this and other countries. Census Bulletin No. 100 gives much information. In cities of over 100,000 inhabitants there are an average of 13.55 patrolmen to each square mile, who make an average of 36 arrests per year. In cities of less than 100,000, there are an average of 3.75 patrolmen to the square mile, who make an average of 51 arrests. The following tables give details:

POLICE STATISTICS BY GEOGRAPHICAL DIVISIONS.

The methods of organizing the police are different in American cities. Mr. **Organiza- A. R. Conkling**, in his *City Govern- tion in the United States*, tells us that in Chicago it is ruled by a single head. Under the city charter of 1872 the absolute control of the police department is vested in the mayor. He appoints all

officers and men. An incoming mayor may promote, degrade, or discharge any member of the force. As a general rule, however, this official transfers most of the responsibility to the superintendent of police. Neither the bureau of elections nor any other of the municipal or county bureaus is in any way connected with the local police department.

In Philadelphia there is a single-headed bureau (which is a branch of the department of public safety) under a director, who exercises all powers, and is appointed by the mayor. There are no police commissioners, and there is no bureau of elections. The sheriff issues a proclamation for elections. The election officers in each precinct are chosen by the people, and the ballots are furnished by the county commissioners. The police have nothing to do with elections except to preserve the peace. They must pass a civil-service examination.

In St. Louis the police department is governed by four commissioners, who are appointed by the Governor and confirmed by the State Senate. The mayor of St. Louis is, *ex-officio*, president of the board. There is no bureau of elections.

In Cincinnati (population 296,000 in 1890) the board of police commissioners is composed of four electors of the city, who are appointed by the Governor. Not more than two members belong to the same political party. Two of the commissioners, of different political faith, are appointed to serve two years; and the other two, also of different political faith, are designated to serve four years. After the expiration of the term of the commissioners designated to serve two years, all appointments made by the Governor are for four years. The mayor is a member of the board, and hence no tie votes are possible. The board of elections is composed of four citizens, who are appointed by the Governor on the same principle as the board of police commissioners.

In Minneapolis the executive power of the police department is exclusively vested in the mayor. The bureau of elections is independent of the police department. No civil-service examination is required.

In New Orleans the police department is under the management of the board of six police commissioners created by the act of the legislature in 1888. The superintendent is the executive head of the force and is subject to the orders of the mayor; but the board has power to pass resolutions regarding the enforcement of any law, as well as to make regulations for the general government of the force. The police do not supervise elections. All applicants must pass a civil-service examination.

In Detroit there is a bipartizan board of four commissioners, who are appointed by the mayor for the term of four years.

In Boston there are three commissioners, who are appointed by the Governor.

New York has had the greatest difficulty with police organization. In early times her police force became a political machine. In 1857, when the Republican party dominated the State, and the Democrats the city, a metropolitan police district was organized and the police power vested in a board of five members appointed by the Governor, the mayors of New York and Brooklyn

New York. being *ex-officio* members. The citizens resisted the enforcement of this act, but finally submitted.

By a law of 1864 the commissioners were reduced to four named in the act. In 1870 the

above act was repealed, and a board of four commissioners was to be appointed by the mayor. Of this act Mayor Hewitt, in a message to the common council in 1888, says:

"The only obstacle in the way of an efficient administration of the police is to be found in the constitution of the board of commissioners, which consists of four members, two of whom belong to each of the great political parties. It was organized as a non-partizan board; but as a matter of fact, from its very constitution, it is nothing more or less than a partizan board. The patronage of the department is notoriously divided between the commissioners, and a large part of their business has been in the past to satisfy the claims of the two political parties whom they represent. It is fatal to the police that politics should enter either into its composition or its administration. *There is no way, so far as I can see, to get rid of this evil but to place the management of the police in the hands of a single commissioner, to be appointed by the mayor, and to hold office during his pleasure.*

"A competent and honest commissioner would, in all human probability, have a permanent tenure of office. There has been no mayor in my day who would dare to confront public opinion in case he should remove such an officer from his position. On the other hand, the fact that the acts of the commissioner would be thus subject to the supervision of the mayor would insure a conscientious discharge of duty."

Seth Low, in opposing a bipartizan police board for New York, says:

"Until it becomes wise to place an army under the charge of four generals it cannot be wise to place a police department under the control of four men. . . . The founders of this republic committed all the great administrative offices of the general Government to a single head. Our cities do not show their wisdom in departing from this practise. They rather illustrate their lack of wisdom, which is the more evident from the fact that they depart from instead of following so great an example."

Mr. A. R. Conkling says:

"Of all the methods of ruling a police force by a board, the Cincinnati plan is, I think, the best; for there the mayor (an elective officer) may prevent a tie vote, and the electors can hold him responsible for the condition of the department. The chief objection to a bipartizan board is that, if one commissioner changes his politics, there is no way of removing him, unless there be in the statute a provision that any commissioner who joins another organization forfeits his office by that act. But the system of making the police force a department of the municipality is wrong. The American people should learn a lesson from the governments of Europe and place the police departments under the supervision of the State. The police power belongs to the commonwealth. The true remedy for the existing evils of the police boards of cities is to remove the department from politics and make it a branch of the State Government under the control of one official. No police commissioner should stand for office, and it is forbidden by law in New York. The Governor should appoint the commissioners throughout the State, as is now the custom in several of the large cities."

Recently, New York has had a complete overhauling of her police force (see LEXOW INVESTIGATION), and many reforms have been proposed. It was sworn testimony that an applicant must pay, either by political assessment or otherwise, for appointment, and an officer must contribute an enormous sum, either to the "ring" or to the commissioners, for promotion; that accordingly many members of the force, of all grades, extorted money from certain classes of citizens in return for a license to violate the laws and ordinances with impunity, and that the police force organized machine votes for their friends.

In Great Britain the police is founded on a civil plan. In London the commission consists of a chief and his assistants, appointed for life by the Queen on the recommendation of the Home Secretary. The metropolitan police is composed of 15,099 officers and men and 334 horses, for which the annual appropriation is \$6,437,550. There is also the city police, consisting of 988 men, whose yearly compensation is about \$570,000.

Europe.

In Paris the organization of the police is distinctly military, under a prefect of police who is under the minister of the interior. The prefect occupies almost a cabinet position and resigns after a conspicuous failure, as after the students' riot in 1892, and the assassination of President Carnot. The number of men belonging to the municipal police of Paris is 8174, and the annual appropriation is \$4,370,926. There are also "indicators" or spies, usually reformed criminals.

In Berlin there are many kinds of police, all in military organization under the minister of the interior. The force is divided into two departments, the day watch and the night watch. The municipal authorities maintain besides a force of night watchmen, whose duty is chiefly to protect the property of the citizens. The Berlin force consists of 4500 policemen.

The police of Vienna is composed of 2800 officers and men. In Glasgow the yearly expenditure is \$358,350 for a force of 1347 men. On the Continent of Europe, the police are usually armed with swords and revolvers, and mounted officers are much more numerous than in the United States. In some cities, as in Paris, the police commonly carry muskets with fixed bayonets when on guard duty.

In Russia the police are the executive administrators of the empire, and their number is unknown. There are about 10,000 in St. Petersburg. Many of them are detectives or the famous "Third Section." They are unarmed, but carry whistles.

Concerning the evils of the present police system in American cities, see LEXOW INVESTIGATION, also POLICE COURTS. It must not be forgotten that besides the political and administrative corruption of the police of which we hear so much, there are other evils of which we do not hear. Their task is often arduous and the need of good judgment very great. Not too much must be expected. Said an old soldier in mitigation of his drunkenness, "You cannot expect all the civic virtues and temperance included for \$13 a month." The same, tho

to a less extent, since their pay is higher, might be said of the police.

Need of Reform.

Many of them do discharge their difficult work with great faithfulness and surprisingly good judgment. One cannot understand the difficulties they meet without close acquaintance, and a closer acquaintance often shows that many of them are far wiser than the public knows. Yet it is equally true that many of them are ignorant, inefficient, simply bullies in uniform. They are often brutal, and the terror of the weak, rather than a terror to evil doers. Mr. H. M. Boies (*Prisoners and Pau-*

pers, chap. xiv.) considers what may be done for the improvement of the police system. He argues for a carefully selected *personnel*, men of good health, morals, and judgment, appointed for life on good behavior. The force should be firmly instructed, carefully drilled and disciplined, to develop unity and *esprit du corps*. Ordinarily, one policeman to 1200 men he thinks enough, with a thorough system of intercommunication, all under the control of one wise chief, and well supported by the public. Says Mr. Boies:

"Humanity, philanthropy, and religion must follow the policeman on his mission with an untiring and increasing care, both for his own sake and the success of his effort. Counter-attractions must be opposed against the special allurements to which he is exposed. Pleasant resorts must be provided for his off-duty hours, where the better things of life may be contrasted with the debasing pleasures with which his duties make him familiar, and intellectual and moral influences may be brought to bear upon his character. Particular effort must be made to keep up his connections with all the higher influences of social life, with the educational and religious enterprises of the people."

(See also POLICE COURTS.)

References: H. M. Boies' *Prisoners and Paupers*; J. P. Altgeld's *Live Questions*; A. R. Conkling's *City Government in the United States*.

POLICE COURTS are variously organized in different cities, but everywhere have enormous responsibilities. Said Mayor Hewitt of New York City in his message of 1888:

"I do not assert too much when I declare that the position of a police justice is more important to the community than that of a judge of the Court of Appeals. The latter finally settles the law, but the former applies it in the first instance in nearly all cases affecting the life, liberty, and property of the citizens."

In New York City there are 15 police magistrates and eight courthouses, in various parts of the city. A new central building for the criminal courts of record (called the General Sessions) has just been completed. It adjoins the central city prison, or "the Tombs." The poorer portion of the population depend upon these minor civil and criminal courts for the enforcement of their rights and liberties, yet Mr. Conkling (*City Government in the United States*, p. 8) tells us that three out of the 15 police-court judges have been indicted for various offenses, and another has but just escaped. Yet he adds that at least 100,000 persons appear before the police magistrates annually. He says:

"Of this number 86,488 were arrested by the police in 1893. The remainder are those who appeal for warrants or for protection from their oppressors. The police magistrate is generally an absolute autocrat in the cases that come before him. He has discretionary power, and hence it is difficult to impeach a magistrate for an abuse of authority. Moreover, it would usually be easy to obtain a squad of witnesses to commit perjury in the event of proceedings for impeachment in the court of Common Pleas.

"The decisions of the New York Police Magistrates, especially in election cases, depend largely upon the presence of some anti-ring lawyer. If a man of standing appears in behalf of the accused, a majority of the magistrates are inclined to be careful in their rulings."

Brooklyn has six judges, Albany two, other New York cities but one, elected on terms of from one to ten years, with salaries of \$600 or more. In New York city they have a salary of about \$800, and are elected for ten years.

In Massachusetts the magistrates are appointed for life by the Governor of the State. They can be removed only by "the Governor with the consent of the council, and upon the address of both Houses of the Legislature." In Boston the police magistrates are called judges of the municipal court. There are

Organi- zation.

a chief justice, with a salary of \$4,300, also four associate justices receiving \$4,000 each, and one special justice receiving \$4,000. Police courts have a limited civil as well as criminal jurisdiction, and are free from political influence after appointment.

In Illinois police judges are practically appointed by the Governor, as in Massachusetts. There are in Chicago 43 justices of the peace, having a term of office of four years. A justice must be recommended to the Governor of the State by a majority of the judges of the Cook County Circuit and Superior Courts. If approved by the Governor the name of the proposed justice must be sent to the State Senate, which accepts or rejects him. It being necessary for these three tribunals to pass upon the names of the justices, a good class of men fill the places. They are usually lawyers, and their jurisdiction is limited to suits where the amount involved does not exceed \$200. From these justices of the peace the mayor of Chicago selects as many police magistrates as may be necessary, and the city pays their salaries. The mayor can at any time revoke his appointments and name other justices to act as police magistrates, but those once appointed usually continue to hold the office.

Concerning the need of reform in police courts, and the police-court system, Governor Altgeld of Illinois says (*Live Questions*, p. 263):

"Young men and boys, and even girls, accused of violating some city ordinance are treated by the police and the police magistrates, in the first instance, in the same manner as the hardened criminal. They are arrested, not infrequently clubbed, sometimes handcuffed, marched through the streets in charge of an officer to the station, which in many cases is worse than a jail, where a full description of each is written down opposite their respective names, and then they are required to give bail for their appearance at some time in the future when the magistrate can hear their case. If they cannot furnish the bond instantly—and generally they cannot—they are shoved into a cell, and frequently occupy the same cell for a night, and sometimes for a week, with the most desperate of criminals. The station-keeper is not to blame for this, for the law has made no other provision and left no alternative but to lock them up.

"Attend a session of the police court in any of our large cities, on almost any morning, and you will see on the sawdust in the prisoners' pen a miscellaneous crowd of human beings of both sexes, ranging from middle life down to tender years, nearly all from the

Evils of System.

less fortunate class in life—poor, more or less ragged, with misery stamped deep into their faces, weak, with little or no training, no steady habits, without homes worthy of the name, and raised in an atmosphere destitute of good and pregnant with vicious influences. As their cases are called, you learn that about one out of 12 is charged with a serious offense, about five-twelfths are charged with minor offenses, but there is something about the appearance of the accused which tells you they have made this round before. The remaining half are also charged with minor offenses, such as drunkenness, disorderliness, etc., but you soon become satisfied that they are not yet thoroughly depraved; that while they may have violated some ordinance, they yet have the stuff in them to make good

citizens, if given a little better chance; and, as you look at them, the conviction settles in your mind that it was unnecessary, and therefore wrong, to drag them in and corral them like so many cattle, and that neither they nor anybody else will be benefited by such treatment. If you ask the magistrate why they were thus treated, before they had even been tried to see if they were guilty, he will tell you that the law required this; that under the law no other course was open.

"You sit down while their cases are heard, and to your surprise find that about one-third are discharged by the magistrate because the evidence fails to show that they were guilty of any offense whatever. (The police reports show that nearly one-third of all that are arrested are discharged by the magistrate.) Turning then to those not discharged, you find that a few, being shown to be probably guilty of the graver offenses, are bound over for the action of the grand jury, while the great majority are shown to have violated some ordinance, and are fined; and as the fines are not paid at once in many cases, you see men, women, and often children, crowded into an omnibus with iron grating at windows and door, and driven to the workhouse or to the bridewell (which may properly be called a short-term penitentiary) to work out the fine, or, in the absence of a workhouse, they are led back to jail to serve out the fine at so much a day.

"In Chicago in 1881, of 32,800 arrested, 20,743 were discharged by the police magistrates, to say nothing of those that were bound over to the grand jury and then discharged. Thus, during one year, there were in that one city upward of 10,000 young persons, who, without having committed any crime, were yet condemned to undergo a regular criminal experience. . . .

"Every case has to go through the same steps, no matter how much the circumstances may differ; the proceedings must be the same, no matter how trifling the charge; the accused must be arrested, must then either give bond or be locked up until he can be tried and the fact ascertained whether he is even guilty of the trifling offense charged or not, and, if found guilty, then, no matter what the condition of the accused may be, whether old or young, vicious or merely weak, male or female, there is but one course open, and this for all alike; that is, to impose a fine, and, if this is not paid, to send the accused to the jail or to the bridewell."

Of the arrest of women he says:

"It appears from the report of the superintendent of police of Chicago that, in 1882, 6835 women were arrested and taken to the police prisons in Chicago, and that, during that year, 1800 women were incarcerated in the Chicago house of correction, mostly for non-payment of fines which had been imposed. Of the latter number, 359 were reported prostitutes, 871 were servants, 114 were laundry-women, and all were poor. Now, can any good come of thus treating unfortunate women? What are they to do when released? Can anybody tell? The 359 whom the officers call prostitutes, and think that a sufficient accusation to excuse any kind of treatment, were not the petted children of sin—not those that live in gilded palaces and dress in silks and satins, for these are rarely disturbed—they were the poor, unfortunate, and forlorn creatures who, without friends, without sympathy, without money, often hungry, and without sufficient clothing to protect them from the cold winds, wander out on the streets, not so much wantonly as from necessity, literally trying to sell their souls for a morsel of bread, dealing in shame, not from choice, but because every Christian door is shut against them, because there is no place where they can work and find shelter. Now, in what condition are they when they have gone through the above experience? What are they to do when again set at liberty? Experience has answered this a hundred times. They return to their old ways, because there is nothing else that they can do; the only difference being that they have become more degraded, more brutalized by the treatment which they have received, and from which no good ever has or ever can come."

Women Arrested.

(For proposals for the reform of the system, see PENOLOGY, last part of article, Reforms Proposed. See also JUDICIARY.)

POLICE MATRONS.—These are women whose duty it is at police stations, lock-ups, jails, etc., to look after, examine and, if possible,

aid arrested women and girls. They were first regularly employed in this country in Chicago in 1886, owing to the efforts of the Woman's Alliance of that city. In Massachusetts in 1887 the system was first recognized by law. To-day they are found in almost all the larger cities. Massachusetts in 1892 had 22. Boston also has made a step in advance in employing a woman probation officer, to whom girls may be turned over on their first offense, on probation. This gives the probation officer a chance to watch her and advise and help her toward reformation. She is then only imprisoned if she prove incorrigible. All those who know the sufferings and wrongs and indignities often inflicted, by sometimes even well-intentioned policemen, upon girls often more ignorant than sinful, agree that the good that one trustworthy matron can do at a police station can scarcely be overestimated. See Altgeld's *Living Questions*. See *Lend a Hand*, vol. ix. p. 180.

POLITICAL ECONOMY, we consider under the following heads:

- I. Name, definition, and content.
- II. Divisions of the science.
- III. Schools of Political Economy.
- IV. History of Political Economy in England, France, Germany, Austria, Italy, Holland, Belgium, other European countries, and the United States.
- V. Various radical views.

For the consideration of the separate divisions of the subject, as land, capital, rent, wages, etc., see the respective articles.

I. NAME, DEFINITION, AND CONTENT.

The name *political economy* occurs on the title-page of a book on the science, published by Montchrétien de Watteville in 1615, and was employed by Steuart in 1767, by Verri in 1731, and by Adam Smith in 1776, since when it has been the ordinary name. Many other names, however, have been used.

The Greeks used the name *Economics* pure and simple, and this was favored by Hutchison in 1747, and recently by Garnier, Jevons, H. D. Macleod, and Marshall. Cherbuliez talks of economic science, or *Economy*. But this word economy is used to-day of purely household affairs, and therefore needs some distinguishing characterization. Genovesi proposed *Civil Economics*; Beccaria, Pecchio, and Minghetti, *Public Economics*; others, mostly Germans, prefer *State Economy*. Orthes in 1774, and the German protectionists of this century, say *National Economy*. But all these are either ambiguous or emphasize one theory of this science. Scialoja, De Augustinis, Raymond, Ciccone, and other French and Italian writers like the phrase *Social Economics*, but this is to confuse it with sociology. In 1819 Say was made, in Paris, professor of *Industrial Economics*, but this is to choose the name of a part for the whole. Still others have taken, from Aristotle's *Politics*, the term *chrematistics* (Sismondi), or have coined *chrysology*, *plutonomy* (Gujard), *plutology* and *ergonomy*, (Courcelle-Seneuil and Hearn), or *catalactics* (Whately). But all these are too narrow, shutting us up to the term *Political Economy*, which, though in itself vague, is the common term, and at least as good as any.

Coming to definitions, we notice that the term is derived from three Greek words: *πόλις*, city or state; *οἶκος*, household, and *νόμος*, law, custom, or regulation; the term meaning

then, etymologically, the regulation of the household or housekeeping of the state. This corresponds to the German word for political economy, *volkswirtschaftslehre* (*volk*, nation; *wirtschaft*, housekeeping; *lehre*, science).

If we would define more exactly, we notice a development or evolution of the meaning of the word, corresponding very closely to the evolution of the schools of political economy.

To the Greeks, the State was all in all. Political economy was to them very literally the science of the regulation of the affairs of the State. To the Mercantilists and the Physiocrats, it was little more than a science of taxation, or how to raise money for the State, in the best way for the State and the people. To Adam Smith and his school it was mainly the science of wealth. Nassau Senior defines it simply as the science of wealth, and Jevons, in his primer of *Political Economy*, defines it as the science of the wealth of nations, defining wealth as "all those things, and those things only, which are transferable, are limited in supply, and are useful."

The definition of political economy found in Mrs. Fawcett's *Political Economy* may be taken as a fair presentation of this class of conceptions. It is as follows: "Political economy is the science which investigates the nature of wealth and the laws which govern its production, exchange, and distribution."

Definitions.

But this did not give enough weight to the human element in the production and distribution of wealth, and therefore with John Stuart Mill commences a new conception, where the producers and owners of wealth are more prominent.

"Writers on political economy," says Mill, "profess to teach or investigate the nature of wealth and the laws of its production and distribution, including directly or remotely the operation of all the causes by which the condition of mankind or of any society of human beings, in respect to this universal object of human desire, is made prosperous or the reverse." Says Professor Ely of this definition: "Social relations are dragged in through a back door, as it were. It is perceived that political economy must concern itself with them, but they are not at once placed in the foreground as the main thing with which we are to deal. Mill's position is perhaps brought out still more clearly in the full title of his work, which is, *Principles of Political Economy, with Some of their Applications to Social Philosophy*. Social philosophy is evidently viewed as something outside of political economy rather than as a larger whole, of which political economy is only a part."

We next find man put frankly first when Sismondi, the Swiss economist, defines political economy as "the science of human happiness," and Professor von Scheel more scientifically defines it as (translated and somewhat modified by Professor Ely) "the relations of private economies to one another and their union into larger economic communities (as township, city, State), taking into account their origin, their growth, and their constitution, and prescribing rules for that ordering of these relations best calculated to meet the demands of the degree of culture already attained and to be attained in the future."

Professor Adams puts the same in better words when he says: "Political economy treats of industrial society. Its purpose as an analytic science is to explain the industrial actions of men. Its purpose as a constructive science is to discover a scientific and a rational basis for the formation and government of industrial society."

This may be taken as a fair example of the meaning given to political economy by the so-called historical school. This however puts too much relative emphasis upon historical analysis. Cossa's definition is better when he says in his introduction to the *Study of Political Economy* (revised edition): "We will define it by an amplification of Romagnosi's description of it, as follows: political economy is an ordered knowledge of the cause, the essence, and the rationale of the social system of wealth; viz., man's concern with wealth as a social factor to be grasped in its essence through its causes, its rationale, and in its relation to prosperity at large."

It will be noticed that all these definitions practically make political economy the science of wealth, differ-

ing mainly in their conception of what wealth is; a statement which is true of Ruskin's definition of political economy as "the system of conduct and legislature which should multiply human life at its highest standard," since, to Ruskin, wealth is well being or "life at its highest standard." It will be thus seen, too, how political economy has of late years wholly changed its tone. From being merely a study of commodities, it has become a study of civilizations; from being almost anti-human, it to-day centers around man; from being "the dismal science," it has become a science of human progress.

Coming now to the content of political economy, we quote again from Cossa, when he says:

"First, it studies in the social system of wealth what is typical, essential, and permanent, whether this be connected with coexistent or with successive phenomena. Political economy seeks the causes upon which these phenomena depend, measuring, so far as may be, their intensity; finally, it reasons out the manner in which these causes act; that is to say, the rationale which governs them. Second, political economy formulates rules or principles by which the economic functions of political societies can be directed aright. The final goal toward which political economy strives, by the performance of its double duty, is happiness at large."

This conception distinguishes political economy from other sciences. It is different from sociology or social science. Sociology (*g. v.*) is used by some to-day as the generic of which political economy and other social sciences are specifics. According to others sociology concerns itself with all social relations, political, economic, religious, etc., studying the basic laws of human associations. Again, political economy is to be distinguished from statistics, political science, etc. The study of these may be necessary to, but they are not a part of, political economy. Nor is political economy to be confused with private economics or the science of right management of a household or of one private business. Political economy is emphatically a *social science*.

II. DIVISIONS OF POLITICAL ECONOMY.

The first general division of this subject may be into what has been called Pure or National Economics, which undertakes to explain the facts concerning any social system of wealth, that is the *theory*, and Applied Economics, which treats of the *art* of the wisest and best methods of producing, distributing, and exchanging wealth. Another distinction, followed by many Germans, gives us (we quote all in this section mainly from Cossa) (1) Social Economics, also described as civil or national, and sometimes called simply economics, and (2) Political Economics, in its wider sense. Cherbuliez calls it economic legislation, and it is also denominated State economics. This branch deals with the economical functions of the State, as well as of any other subordinate society, and it coincides with our definition of applied economics. Moreover, since these functions cover the whole ground of State interference with private wealth and with all wealth possessed by political societies regarded as individual units, there arises a partition of political

economics into: (a) Political Economics, most strictly so called, or Economic Policy, which supplies the State with guiding principles in all interference with private wealth; (b) Political Finance, or as it is now more usually styled, the science of finance, which deals with public revenues and possessions, furnishing guiding principles for accumulating, administering, and applying all means, especially belonging to the State, the county, or the parish.

The ordinary division of the science, however, is into four parts: (1) production; (2) distribution; (3) consumption; (4) exchange. This division, however, is frequently modified. J. B. Say used only the first three; these three terms occur in the title of his chief work (1803). A glance at works like Gioja's, Kraus', Jacob's, Rau's, Riedel's, Schüz's, and MacCulloch's will show what wide acceptance this scheme received, and how long it has been adhered to.

James Mill, Florez Estrada, Garnier, Baudrillard, Messedaglia, Nazzani, Mangoldt, Schönberg, Walker, Andrews, and Ely, however, use all four divisions.

Kudler varies slightly from this order of treatment, and so do certain French writers—Levasseur, Jourdan, Laveleye, Leroy-Beaulieu, and Beauregard. These put the chapter on distribution first, and then deal with circulation.

Roscher was at one time inclined to add to the four headings in question a fifth on population. But population, statistically, economically, and legislatively considered, is the subject-matter of demography.

Turgot, close upon the end of the last century, Senior, Stuart Mill,—in one of his essays mentioned above,—and Rossi exclude from economics, properly so called, the whole discussion of the consumption or use of wealth. They would assign it to ethics, to domestic economics, and to finance, while other and more recent authors, like Jevons, Walrus, and Pierson, put a theory of consumption before everything else, and argue that it belongs to the discussion of the uses of wealth, upon which hinges the whole theory of value. Marshall connects consumption with his similarly crucial discussion of demand. A middle course is followed by those writers who assign to the discussion of consumption a subsidiary place, regarding it rather as a necessary preliminary to economics than as one of its constituent parts.

Finally, there is a school which holds with Senior and Rossi that consumption cannot legitimately form an independent department, but makes one out of circulation—exchange is the English word, for which Held substitutes traffic. This subject last named Cherbuliez, Villey, Sidgwick, Carter Adams, and Laurence Laughlin, discuss after production, while Mill takes it up after distribution. Perhaps the common division into four parts is sufficient for a study of the theory; but then there should be added: *political economics*, or the determination of the true economic function of the State, and *social economics*, or the

**Ordinary
Division.**

consideration of, the theories as applied in society.

III. SCHOOLS OF POLITICAL ECONOMY.

Under this head we do not consider the history of political economy, but outline the main schools of political economy that one may better understand the history which we consider in our next section. Political economy, as we shall there see, although a subject that has been treated from the earliest days of thought, as a science is modern. Its first

Early Schools.

school may be said to be that of the Mercantilists. They held that wealth is measured by the ownership of gold and silver; that that nation was wealthiest which received most gold and silver in exchange for commodities; *i. e.*, had the balance of trade in its favor. This idea, now given up by economists, long had influence. The leading Mercantilists were Colbert, the great French statesman under Louis XIV., Mélon, Broggia, Genovesi, and in England, Mun, Temple, Child, and Davenant. The Italian Serra is sometimes included in this school, but really took a much broader position.

The next school, and the first to develop a complete system of economics, was that of the Physiocrats (1755-81). Their cry was, "Back to nature. Do away with laws: let nature work. *Laissez-faire.*" They held that agriculture alone *produced* wealth, manufacture and commerce only changing its form and place. Hence they would put all taxes upon land alone. Their leading names are French: Cantillon (1755), and above all Quesnay (1694-1774) and Gournay (1712-59). Turgot (1727-81), the illustrious statesman, applied their theories in practise so far as he could.

The great school of Natural Liberty comes next. David Hume and others led up to this, but Adam Smith (1723-90) is its great head. His *Wealth of Nations* (1776) marked an epoch. He believed in *laissez-faire*, but he was a student of facts, and not an extreme doctrinaire. His followers were not so wise.

School of Natural Liberty.

Malthus (1766-1834) is best known for his theory of population, and Ricardo (1772-1823) for his Law of Rent, but, economically, they were both followers of Adam Smith; Ricardo carrying the law of competition to its theoretical extremes unmodified by facts. Among others of this school were, in England, Senior, Torrens, Chalmers, James Mill, Bentham, Jones, M'Culloch, and Fawcett; in France, Say, Dunoyer, Rossi, Cherbuliez, and Bastiat; in Italy, Scialoja and Ferrara; in Germany, Rau, Nebenius, Von Thünen, and Hermann; and in the United States, Amasa Walker, Perry, Bascom, Bowen, Sumner. A transitional school from that of *laissez-faire* may be said to be that of J. S. Mill, Leslie, Bagehot, Jevons, and Cairnes. In France, Sismondi, Blanqui, and Courcelle Seneuil may be said to belong to this transitional school.

The next great school is the historical school, largely German, which holds that

principles of political economy must be derived inductively from history; that it has a large moral relation, which must be considered; that it is concerned with society as an organism, and demands considerable paternal action from the State.

Historical School.

The leaders of this school are, in Germany, Roscher, Hildebrand, Kneis. It led also to the movement of the so-called socialists of the chair (*q. v.*), who must be included in this school, Schmoller, Nasse, Held, Brentano, Von Scheel, Schäffle, Wagner, and others. In Belgium, de Laveleye; in England, Ingram, Marshall, Rogers, Foxwell, Cunningham, Symes; in the United States, Ely, James, Jenks, H. C. Adams, W. J. Ashley, and Bemis, are prominently of this school tho differing materially in their views.

Most modern economists, however, decline to be considered of any school. We are, therefore, unable longer to trace any schools, tho groups of men often stand in their views much together, like the modern Austrian economists, with their psychologic economies and development of the theory of final utility. They represent perhaps the latest school and have a growing following, especially in the United States with such men as Patton, Clarke, and others. A mention should be made of the American Carey, who is sometimes considered the founder of an American school quite different from all others, but this must be referred to our next section.

IV. HISTORY OF POLITICAL ECONOMY.

In the following outline of the history of economic thought our main authorities have been Ingram, Cossa, and Cohn (see References at the end of this article). Cossa is the fullest authority, but, unfortunately, not the most reliable. We have, therefore, followed Ingram very largely; and Cossa, where Ingram is not full enough. Cohn we have consulted largely for Germany, and Ugo Rabbino for Italy. The earlier and less known writers we have considered more fully in this article than the known writers, because all the most prominent will be found considered under their respective names.

A. IN ANTIQUITY.

Ancient thinkers were prevented by various causes from getting at the conception of rational laws governing economic affairs. The principal of these causes were social and political conditions. Slavery, coupled with arbitrary despotism, prevented economic development.

War was another great hindrance. Modern communities are organized for industry; ancient communities were organized for war. This widely separates the present from the past. It was in the military constitution of society that the institution of slavery was rooted. Whatever possible excuse or reason can be urged for slavery is to be found in war. As a natural result of ancient slavery, almost all industry and manual labor was considered degrading and unworthy of a free citizen. The free artisans were ranked but little above the slaves, and no occupations were thought honorable except those of administration and war. Those to whom the production

and traffic of the country were left were unfitted to develop any advanced system or science of industry. Moreover, the insecurity of life and property in military states prevented any such development and rendered any extensive method of cooperation, or concentration of capital, well-nigh impossible. An effective system of credit demands national peace as its foundation. Thus slavery and war combined to limit and dwarf all study of social and economic conditions; and revealed to us most clearly that two things are essential to any advanced and humane system of economics—peace, and the dignity of labor.

The economic ideas of the East are little more than a few moral precepts about virtue, industry, temperance, and charity, taken from their sacred writings; caste and the sway of custom made the East unprogressive. Only a few individual Chinese writers have any clearer ideas of the nature of commerce, etc. From a fragment of Kwantsze, written in the seventh century A. D., and from two writers in the eleventh, one may learn that the Chinese anticipated in their customs many modern institutions.

In Greece the State was all in all. The individual is regarded only as a minute fraction of a great whole.

The constant aim is to develop good citizens, who shall maintain and serve the State to which they belong. The individual is to find his own development and completion in self-forgetful patriotism. The citizen is regarded as a possessor, and not a producer, of wealth; and wealth is never regarded as the supreme good, but only as a means to an end. Social problems are studied primarily from the ethical and educational point of view.

The Greeks divided morals into domestic economy, ethics in their strict sense, and politics, or the art of government. They came to have an exaggerated conception of the efficacy of laws and institutions. (See ATHENS; GREECE.)

Different individuals proposed quite different systems. Hesiod, in his *Works and Days*, mingles with many traditional precepts of sacerdotal origin a large measure of practical sagacity; and concentrates his thought into proverbs. But, commencing with Thales, begins the development of abstract thought, which not only marks a new era in the progress of Greek culture and philosophy, but also in the intellectual history of mankind.

The Socratic school is both concrete and ideal. The best known of these ideal systems is that of Plato (429-348 B. C.), who presents in its most advanced form the Greek conception of the State. So far does he subordinate private to public interests that he represents the higher class of citizens as having community of property and wives. His system is inflexible and mechanical and allows little scope for the action of the humaner passions. The individual is little more than a cog in the wheel; and slavery is at the foundation. He would abolish interest and the use of silver and gold. Government control of industry he believed to be necessary and right, to prevent undue luxury at one end, or undue poverty at the other. This ideal communism he develops in his *Republic*. In his *Laws* he considers what is possible rather than what is ideal. Throughout his works, however, are many lofty conceptions of social and moral duty and some just economic analyses. (See PLATO.)

Xenophon (440-357 B. C.) is more practical and matter-of-fact. His observations, however, are chiefly limited to domestic economy, such as the government of the family and care of private property. In common with all Greeks he exalts agriculture above other industrial occupations, as best tending to cultivate religious and patriotic feelings. And, contrary to most Greeks, he speaks respectfully of trade and manufactures, demanding for commerce the protection of the State. He recognizes the fact that money in itself is not wealth. He is an advocate of peace, as he perceives the impossibility of international commerce without international harmony. Slavery was to him natural and legitimate; and one of his recommendations is that branded slaves be hired out by the State to labor in the mines, so that the State revenue may be increased thereby.

Aristotle (384-322 B. C.) represents the highest stage reached by his countrymen in social studies. He was not only a thoughtful spectator, but an impartial one as well, and gifted with unusual generalizing ability. He had in a strong degree the Greek devotion to the public good; and his opportunity for observation was unequalled by any of his countrymen. All that was original or important in the political life of Greece was before his eyes. It is too much to expect of him

more than static sociology, or any recognition of the laws of the historical development of social phenomena. He has conveyed to us a remarkable body of sound and valuable observations and ideas concerning the constitution of the social organism. He differs from Plato and most Greeks in his conception of the State; opposing the absorption of the individual, the suppression of personal freedom and right of initiative, and altogether rejects the community of wives and property proposed by Plato. He regards the abuse of the principle of private property as avoidable, and as owing to imperfect human nature and vicious legislation. The producers and manufacturers of society he excludes from citizenship, as it was commonly thought that mechanics, artificers, and farmers were debased by their occupations, being without the necessary leisure and wealth to acquire education and culture. Not only does he see no evil in slavery, but defends it as natural and lawful. He considers a slave as a mere "animated tool," having no independent will, and finding his true and highest well-being in obedience to his owner. In this view he acts simply as a mirror in which all Greek thought is represented. He is only the spokesman of a society founded upon the systematic degradation and enslavement of a despised and cruelly treated class. He considers it the duty of government to preserve a due proportion between the population and the territory of a country. It is impossible to imagine what he would have said to such overcrowding as exists to-day in European and American cities. (See ARISTOTLE.)

The task of the Romans was military and political, and in spite of their practical views of life and utilitarianism, they produced no highly developed system of manufacture or exchange. The agricultural habits of the first Romans soon gave place, through the increase of militarism, to an extensive system of slave-labor.

Large estates took the place of small holdings, and drove the peasant proprietor to the city streets. Commerce and industry were regarded by the free citizen with contempt, and even the noblest Romans were not free from this disdain of all manual labor. Some signs of economic thought are to be found in the writings of the philosophers and jurists; but most of their ideas were taken from the Greeks, and none of their original conceptions are of much scientific value. The philosophic writers express the general feeling of industrial decay, and the increasing tendency toward luxury and immorality. To be sure the virtues and pleasures of rural life and agriculture are much dwelt upon, but chiefly with no higher purpose than to glorify the hardihood of the early Romans. As to the social evils which surrounded them they were very largely indifferent and short-sighted. Pliny, the elder (23-79), who is not so much an independent thinker as an Encyclopedist, in his *Natural History* favors agriculture on the large scale, but protests against the slave-tilled *latifundia*. He expresses a preference for barter rather than for a money exchange, and deplors the use of gold. Varro and Columella are to be credited with having perceived the superiority of free labor to that of slaves; and, together with Cato, they advocate a return to agriculture as the best means to avert the flood of corruption and immorality which was then felt to be approaching the empire. Cicero translated Xenophon's *Economics* and also praised agriculture.

As to the general principles of industrial progress they have little to say. In general, the Roman theorists agreed with the Grecians in disapproving of interest, Cato going so far as to liken it to murder. In B. C. 341 the taking of interest was entirely forbidden by the Genueian Law.

Both Greeks and Romans approached social problems from the political rather than the economic side. It is unfair to them to expect from their writings much economic truth, or more than the slightest germs of modern developments. Political economy is necessarily a modern science.

B. THE MIDDLE AGES.

The period between the years 400 A. D. and 1300 A. D. is one of much importance, as being a time of great change and potentiality. Everything modern is deposited there in germ. Altho, from the absence of brilliant literary lights, this period has been termed

the Dark Ages, there was, nevertheless, not a little illumination of other kinds.

It was between these dates that two vast systems were erected—feudalism and Roman Catholicism.

Under the feudal system no fully developed economic activity was possible. All production was upon a small scale, and the volume of commerce was insignificant. The mechanical arts were still held in contempt, and militarism absorbed the interest and energies of the community. Nevertheless, there was important thought and action.

The canonical theory of usury, with its prohibition of interest, has an important practical bearing upon history and economics.

All the Church fathers base explicit and unqualified condemnation of usury—that is, of interest—upon texts of Holy Writ and upon the universally valid precept of charity. This precept involved the canonical prohibition of interest, which was, however, during the first eight centuries of the Church binding solely upon ecclesiastics. The Latin Church, but not the Greek, then proceeded to make it binding upon laymen also, as may be abundantly seen in the proceedings of many ecumenical and national councils, whose utterances are increasingly preceptory up to the end of the thirteenth century.

Gradually, however, exceptions were more and more allowed, till, when Calvin and the leaders of the Reformation allowed interest, Rome was ready to follow suit. In other directions thought was also active.

In theology and philosophy Saint Thomas of Aquino (1225-74), the Angelical Doctor, had no peer, and he was also the greatest writer of the age on politics and economics. (See AQUINAS.)

In the fourteenth century we have Engelbert, Abbot of Admont in Styria; Fra Paolino, probably a Venetian; Colonna, an Augustinian monk; Andrea d'Isernia, a Neapolitan lawyer; in France, Philip Dubois; Jean Buridan, rector of the University of Paris; the Dominican monk Durand de Saint-Pourçain, Bishop of Meaux in 1326; and Philippe de Mezerles, councillor of King Charles V., who were the projectors of the *Monts de Piété* (q. v.), by establishing which the State was to rescue needy persons from the oppression of usurious Jews.

Last must be mentioned the most remarkable of them all, Nicholas Oresme, who died in 1382 as Bishop of Lisieux. He wrote his *De Origine, Natura, Jure et Mutationibus Monetarium* for his pupil, Charles V., and afterward republished it in French. Here is a simple, well-arranged, and clear summary of the theory of money, together with a masterly arraignment of those who were for debasing coin.

In the fifteenth century we have Sant' Antonio, Archbishop of Florence, and San Bernardino, a Franciscan of Siena. Kuppener, Summenhart, and the German Biel deserve mention. "Among humanists," says Cossa, "three remarkable men, Giovanni Gioviano Pontano from Umbrian Cerreto, Benedetto Cotrugli of Ragusa, and last but not least, Diomedes Carafa, Count of Maddaloni, effected by word and deed certain very sound financial and economical reforms in the kingdom of Naples under kings of the house of Aragon.

"Pontano (1426-1503) is remarkable for sound fiscal rules and praiseworthy counsels in economic ethics. His works appeared in two volumes at Naples (1505-08).

"Cotrugli's small book *Della Mercatura e del Mercante perfetto* was not written until the middle of the century. Genovesi and Zanoni speak highly of it. It deals specifically with value, price, and exchange, as well as mercantile contracts.

"Carafa's pamphlet *De Regis et Boni Principis Officio*, written a few years before or after 1475, by Eleanor of Aragon's special command, stands head and shoulders above all contemporaneous works on finance. Carafa, who died in 1487, has new ideas about the function of commerce, about public revenue and public expenditure, and about the advisability of farming out the taxes. He it was who first conceived the idea of taxing fixed incomes."

C. FROM 1500 TO THE MERCANTILISTS.

The downfall of feudalism and the ecclesiastical power gave free scope to the irregular and disunited activity of individuals. It emanci-

pated the mercantile class from a tyrannous and traditional authority, but left them without a bond of union or a source of wise and helpful guidance. Private ambition and avarice were encouraged as motives of action. In the midst of such moral and industrial chaos, the powers of governments were taxed to maintain mere material order.

By the establishment of standing armies, the merchant and manufacturing classes were protected, and enabled to enlarge and systematize their business. Their increasing power is evidenced by the general admission of the commons as an element in the political system, while the occasional insurrections of the working classes revealed the gradual breaking down of the spirit of servile obedience to unjust authority.

The mariner's compass gave greater security to foreign commerce, and the art of printing connected the industrial with the intellectual forces. In Venice, Genoa, and other Italian cities public credit was established. Trade was greatly developed by the discovery of America, and of the new route to the East. In the sixteenth century economic thought still clung to its medieval conceptions; a change, however, slowly coming. The historical and political writers, Palmieri, Machiavelli, and Guicciardini, have a little to say on economics. There is quite a development of utopian communism. Of this, More's *Utopia* (1516) (see MORE) is the best known.

James Harrington, in his *Oceana* (1640), criticizes large land-holdings. Tommaso Campanella, a Dominican monk of Calabria, in his *Civitas Solis* (1607), took the step, from which Plato did not shrink, of advocating a community of wives; the argument being that a community of goods involves the abolition, not only of private ownership, but of the family as well.

Another such work is the far less familiar one of Ludovico Vives, *De Communiione Rerum* (1635), a Spanish philanthropist.

Last of all comes Anton Francesco Doni with his *Mondi celesti terrestri ed infernali* (Florence, 1552-53). Here a free rein is given to unbridled and eccentric fancy.

In Germany, Frank and Münster (see ANABAPTISTS) sought to put these ideas in practise.

Among writers who gave attention to economics and finance in general works of a political character, which embraced administration at large, may be named Jean Bodin d'Angers (1530-96). In the sixth book of his *République* (1576), he takes climate and soil into consideration as factors in any financial and economical system, and argues in favor of the free importation of corn and cattle, advocating at the same time high customs duties upon foreign manufactures, and the prohibition of all exportation of food products or raw materials.

Conspicuous among the economists of the first half of the seventeenth century, and considered by some the creator of political economy, was Antonio Serra of Cosena in Calabria. His *Breve Trattato delle cause che possono fare abbondare li regni d'oro e d'argento dove non sono niuere* was published at Naples in 1613, and was written in the Papal prison. It was not brought to light until a century after its publication. He is largely an advocate of Mercantilist principles, insisting on the superiority of manufactures to agriculture, as a source of wealth. He recognizes, however, that the acquisition of wealth is not the only condition of prosperity, and that the influence of a nation's commercial policy upon the character of its citizens is to be considered. Montchretien de Watteville, a Frenchman, first used the name "political economy" (in 1615), and wrote a valuable treatise on the subject. In his treatment of the subject, he omits agriculture.

In 1530 the Albertine pamphlets appeared in Germany. These were the first German publications on political economy which were thoroughly national and popular, and they were written to antagonize a proposed debasement of the currency.

In England at least two writers are prominent. William Petty (1623-83), one of the most illustrious forerunners of the science of statistical research, was most determined in his opposition to many if not all of the Mercantilist views. He joined hands with Locke in demanding a single standard for money, he was one of the earliest enemies of restrictive laws about interest, and it was he who declared that wealth, the child of mother-earth, has for its father the active principle of cultivation.

John Locke, the celebrated philosophical and political

author (1632-1704), can hardly be classed otherwise than as a Mercantilist, and must even be written down as a systematic upholder of the errors of that system. Nevertheless, in respect of certain theories in detail,—such as property, which he bases upon work done, and money, the debasing of which he loudly condemned,—he lays claim to originality.

Thought in the seventeenth century was tending to the school of

D. THE MERCANTILISTS.

The doctrine of the Mercantilists is that the wealth of a nation is to be computed by the amount of gold and silver it possesses, and that the chief endeavor in commerce is to export as much and import as little as possible. National profit or loss was to be decided by the balance of trade; that is, the amount of gold and silver paid or received after the exchange of goods. It was considered the main object of government to secure by all available methods such a balance. The precious metals were considered the sole standard and measure of wealth. The gold and silver mines of the new continent excited this extreme metal-idolatry, and awoke all the slumbering cupidity of Europe.

This represents, however, the most extreme party of Mercantilists. Not all of them were so infatuated with the glitter of white and yellow dross. The Mercantilists were not connected by any one definite theory, but were rather included in a general tendency. Their more commonly received principles were as follows: (1) the overestimation of gold and silver; (2) the undue exaltation of foreign over domestic trade, and of manufactures over the production of raw material; (3) the overvaluation of the national benefit of large population, and (4) the demand for governmental aid and protection.

The dogmas of the Mercantilists were not based upon any scientific investigation of the true and normal laws of trade. They were rather photographs of the practical activities of their time. The force of local circumstance molded them, which circumstance they at once proclaimed universal and fixed. Yet it must not be thought that this period was without its use and place in philosophic history. Europe was entering the doorway of social development. The trading and manufacturing zeal of the period was necessary and just, as leading to the inventions of modern times, and to the organization of industry. Agriculture, being hampered with the ceremonies of feudalism, lagged behind; and progressed only so far as the new life of the towns surged over into the country. Hitherto nations had been striving in the arena of political competition; now their competition was transferred to trade. Thus a national economic interest came into existence. The Government became the god-father of the city industries. Production was not so spontaneous as in the former period, as it became regulated more or less, to secure the cheapness and goodness of the goods exported. Large corporations and trading companies naturally were formed, with special privileges granted them by the Government.

High tariffs came into existence, partly for revenue, and partly for protective purposes. International diplomacy concerned itself with commercial treaties, its main endeavor being to prevent the importation of the manufactured goods of other countries, and to shut out other nations from competing in the foreign markets. The colonies were peremptorily forbidden to trade with any but the mother country. Working men were drawn over from foreign countries to engage in new lines of manufacture, and much was done for the promotion of technical skill. One important result of Government patronage was the removal of the contempt for commerce and the comparative elevation of the industrial classes.

No one man or class of men is responsible for the rise of the mercantile system. It was a natural growth, which was not allowed completion. On the breaking down of the medieval system, the policy of individual manufacture and free competition spontaneously arose. Monarchs acquiesced in it and conformed their measures to it. Commercial competition soon became the law for nations as well as for individuals, and each strove with the others for the market of the

world. During the seventeenth century the race was led by Holland, which maintained the supremacy of the seas until Cromwell, by his Navigation Act, transferred the world's carrying trade to England. Cromwell and Colbert of France were by their whole economic policy the chief practical representatives of the mercantile system. It is, however,

due to Colbert to state that he regarded the greater part of the Mercantilist expedients as temporary only, speaking of protective tariffs as crutches by which trade might learn to walk alone. There is no doubt that his policy was the chief cause of the rapid development of French manufactures and commerce. As in other countries, French industry was hampered as well as helped by the Government. The regulation of trade often forced it into unnatural channels of activity, and prevented initiation and invention. And although Colbert and others sought to compensate trade by obtaining technical information from foreign lands, it was not a sufficient compensation to atone for the repression of spontaneity and free development.

The most prominent English Mercantilist was Thomas Mun. Mun held a brief for the East India Company, on whose behalf he established that the net result of Indian trade brought more money home than it carried abroad. This argument he brought out in his *A Discourse of Trade from England unto the East Indies*. His far more important publication, however, was brought out by his son in 1664, long after he had died, and bore the title,—an argument in itself,—*England's Treasure by Foreign Trade*. Steering clear of exaggerations indulged in by many subsequent Mercantilist writers, Mun sets forth in this work a complete theory of international trade.

English Mercantilists.

Mun's great point is that only one thing really enriches the State, and that is such a shaping of complex commercial transactions as shall secure that the value of all imports shall be less than that of all exports in a given time.

Of the same school, although more moderate, are Temple, Child, and Davenant.

William Temple, who represented England for many years in the Low Countries, has recorded excellent impressions on labor, savings, luxury, and the relations between consumption and production. Josiah Child is still more remarkable for his sound understanding of the character of money, for his well-balanced ideas on population, for his protest against monopolies and in general against everything that hampered internal trade. But perhaps his greatest merit lies in his comprehension of the balance of trade as the result rather than the cause of healthy trade, and as especially dependent on a rightly managed merchant marine. Davenant (1656-1714) wrote works on economics, finance, and statistics, which mark a still further step in advance. In his later works he loses confidence in the calculations that were available for determining the amount of imports and exports, so that, as Pierson hints, he ends by being only nominally a Mercantilist, though he is enough of one to give staunch support to privileged companies and to the most inelastic of colonial systems. Francis Hutcheson, the remarkable Scotchman, founder of the new school of philosophy in Scotland and teacher of moral philosophy in Glasgow (1730-46), had many ideas of natural rights, etc., but was nevertheless a strong Mercantilist.

The French Mercantilists are not so prominent. Perhaps the best book is Jean François Mélon's *Essais Politique sur le Commerce* (1731), which gave a clear-cut and succinct summary of the economic doctrines then in vogue, under the then favorite name of commercial theories. Mélon calls for commercial liberty, which he narrows down to a free exchange of superfluities for necessities.

In Italy there were several important writers. The archdeacon Bandini (1677-1760) seems to have been a really remarkable man, and perhaps not to be counted a Mercantilist, though mentioned with this school. C. A. Broggia and Girolamo Belloni were decidedly of that school. But the greatest Italian Mercantilist of the century was Antonio Genovesi (1712-69), a Neapolitan. To secure him from theological persecution one of his friends founded for him the first chair of economics established in Europe (1755), one of the conditions of which was that it could never be filled by a monk. His *Lezioni di Commercio* (1765) is the first complete treatise in Italian. Ferdinando Galiani is another prominent Italian of this school.

While secretary of the Italian embassy in Paris, he published (1770) his *Dialogues sur le Commerce des blés*, a book greatly praised by Voltaire. Of the German Mercantilists Ingram says:

"In no country had Mercantilist views a stronger hold than in Germany, though in none, in the period we are now considering, did the system of the balance of trade receive a less extensive practical application. All the leading German economists of the seventeenth century—Bornitz, Besold, Klock, Becher, Horneck, Seckendorf,

Germany.

and Schröder—stand on the common basis of the mercantile doctrine. And the same may be said of the writers of the first half of the eighteenth century in general, and notably of Justi (d. 1771), who was the author of the first systematic German treatise on political economy, a work which, from its currency as a text-book, had much effect on the formation of opinion. Only in Zincke (1692-1769) do we find occasional expressions of a circle of ideas in variance with the dominant system, and pointing in the direction of industrial freedom. But these writers, except from the national point of view, are unimportant, not having exercised any influence on the general movement of European thought."

E. THE STEPS TOWARD LIBERALISM.

Several writers must be noticed here who scarcely form a school and yet are of great importance as preparing the way.

Richard Cantillon was a banker belonging to an Irish family, who lived for many years at Paris, where he had business dealings with Law. He finally died by the hand of an assassin at London in 1734. His *Essay on the Nature of Commerce at large* was not published until 1755, though he wrote it during the last four years of his life. Cantillon's *Essay* is pronounced by Jevons to be the first systematic treatise, the cradle, as it were, of real political economy. It falls into three parts. In the first he considers land and labor; in the second, money; in the third, international payments.

David Hume comes next. Says Cossa:

"It is no easy task to assign Hume's (1711-76) right place in the history of economics, though it is not difficult to reject the claim made by his biographers, Walckenar and Burton, that he founded political economy. . . . Hume's *Political Discourses* will not bear comparison on the score of coherence and unity with Cantillon's brief, systematic, and thoroughgoing performance. But Hume's title indicates a significant point of view, and he deals with the theory of population, of luxury, of circulation,—including trade, money, interest, the mercantile balance, and the working of jealousy in trade transactions,—and of finance, including taxation and public loans, but excluding capital, value, and wages. His views were instinct with liberalism and the warmest love of progress. He was Kant's forerunner in philosophy, and had the gift of a wonderfully clear and charming style. Indeed, Adam Smith made no secret of his admiration for Hume, who was his 'guide, philosopher, and friend.'"

In England.

Sir Dudley North, who wrote *Discourses upon Trade* in 1691, branded Mercantilism as a political aberration. Money, he argued, is a commodity distributing itself in the course of nature among various nations according to their needs, which are registered by the ups and downs of market prices. Classes as such, according to North, have no exclusive concerns of their own, but society is bound together by the solidarity of interest, and the same holds true among States, so that absolute free trade, both industrial and commercial, is the one and only way of achieving wealth.

Of other Englishmen who led the way to Adam Smith we quote from Ingram:

"Josiah Tucker, dean of Gloucester (d. 1799), holds a distinguished place among the immediate predecessors of Smith. Most of his numerous productions had direct reference to contemporary questions, and the marked by much sagacity and penetration, are deficient in permanent interest. In some of these he urged the impolicy of restrictions on the trade of Ireland, advocated a union of that country with England, and recommended the recognition of the independence of the United States of America. The most important of his general economic views are those relating to international commerce. He is an ardent supporter

of free-trade doctrines, which he bases on the principles that there is between nations no necessary antagonism, but rather a harmony, of interests, and that their several natural advantages and different aptitudes naturally prompt them to exchange. He had not, however, got quite clear of mercantilism, and favored bounties on exported manufactures and the encouragement of population by a tax on celibacy. Dupont, and after him Blancqui, represent Tucker as a follower of the Physiocrats, but there seems to be no ground for this opinion except his agreement with them on the subject of the freedom of trade. Turgot translated into French his *Important Questions on Commerce* (1755).

"In 1767 was published Sir James Steuart's *Inquiry into the Principles of Political Economy*. This was one of the most unfortunate of books. It was the most complete and systematic survey of the science from the point of view of moderate mercantilism which had appeared in England. Steuart was a man of no ordinary abilities, and had prepared himself for his task by long and serious study. But the time for the mercantile doctrines was past, and the system of natural liberty was in possession of an intellectual ascendancy which foreshadowed its political triumph. Nine years later the *Wealth of Nations* was given to the world, a work as superior to Steuart's in attractiveness of style as in scientific soundness. Thus the latter was predestined to fail, and, in fact, never exercised any considerable theoretic or practical influence. Smith never quotes or mentions it; being acquainted with Steuart, whose conversation he said was better than his book, he probably wished to keep clear of controversy with him."

The French champion of economic freedom of this age is René Louis Voyer, Marquis d'Argenson (1694-1757). For a short time he was in the ministry, and he wrote various works on politics and economics, which remained unpublished for more than a century, as well as an epoch-marking essay published in the *Journal Oeconomique* (1751).

Continental Writers.

Another Frenchman who should be noticed was Pierre Boisguillebert, a passionate antagonist of the Mercantilist school. Vauban, in his economic tracts, especially his *Projet d'une Dixme Royale* (1707), follows the same line. Of Fénelon and Montesquieu, Ingram says:

"The liberal and humane spirit of Fénelon led him to aspire after freedom of commerce with foreign nations, and to preach the doctrine that the true superiority of one state over another lies in the number indeed, but also in the morality, intelligence, and industrious habits of its population. The *Télémaque*, in which these views were presented in an attractive form, was welcomed and read among all ranks and classes, and was thus an effective organ for the propagation of opinion.

"After these writers there is a marked blank in the field of French economic thought, broken only by the *Réflexions Politiques sur les Finances et le Commerce* (1738) of Dutot, a pupil of Law, and the semi-mercantilist *Essais Politiques sur le Commerce* (1731) of Mélon, till we come to the great name of Montesquieu. The *Esprit des Loix*, so far as it deals with economic subjects, is written upon the whole from a point of view adverse to the mercantile system, especially in his treatment of money, tho in his observations on colonies and elsewhere he falls in with the ideas of that system. His immortal service, however, was not rendered by any special research, but by his enforcement of the doctrine of natural laws regulating social no less than physical phenomena."

Among the most progressive of the Italian writers the most prominent is Cesare Beccaria (1738-94). His treatise *Dei delitti e delle pene* is said to have been translated into twenty-two languages. The Austrian Government created for him a chair of political economy, and his *Elementi di Economia Publica* (1771, published in 1804) was the result. He was something of a Physiocrat and strongly opposed to monopolies, privileges, etc., although a protectionist. Other Italians of less prominence are Pietro Verri (1728-97), Giovanni R. Carli (1720-95), Giambattista Vasco (1733-96), Gaetano Filangieri (1752-88), the second volume of whose *Scienza della Legislazione* treats of economics and seems to take many of the positions of Adam Smith, without knowing it. Still other Italians are Ludovico Ricci (1742-99); Ferdinando Paoletti (1717-1801), a public-spirited priest and a Physiocrat; and Francesco Mengotti (1791). Here, perhaps, should be mentioned Giannaria Ortes (1713-90), neither a Mer-

cantilist nor a Liberalist, but finding his ideal in the Middle Ages. In Spain, Geronimo Ustariz (1724) was an extreme Mercantilist. Count Pedro Rodriguez (1723-1802) represents the Liberal school. In Austria Sonnenfels (1733-1817), the first distinguished economist of that country, is a Mercantilist, but a very liberal one. In Germany, according to Roscher, the greatest economist of the eighteenth century was Justus Möser (1720-94), the author of *Patriotische Phantasien* (1774), praised by Goethe. He is opposed to the Aufklärung and liberalism, and, like the Italian Ortes, looks back to the Middle Ages. He opposes absolute private property in land and somewhat favors the commune.

F. THE PHYSIOCRATS.

Says Cossa: "The unparalleled merit of having created a scientific system of political economy, or, to phrase it better, of philosophic social jurisprudence viewed chiefly in its economic aspects, undoubtedly belongs to a man of genius named François Quesnay, founder of the physiocratic school. The name 'physiocratic' was given to them after 1763, before which time they bore, as a sort of nickname, the title of 'economist.' When I speak of theirs as the first scientific system, I intend to convey the fact that they deduced from a few ultimate principles a perfectly homogeneous whole, comprising pure economics as well as political and financial economics. What gave them their name was the basis of their system—a recognition that natural laws are paramount."

They held that there was such a theory as a *jus nature*, a harmonious and beneficial order of nature, corresponding in economics to the theological conception of a beneficent divine providence, and they taught that wisdom consisted in doing away with all artificial laws and customs preventing the working of this divine order. It was the same conception that made Rousseau criticize the existing order of society and advocate a return to "natural" liberty. It will be seen, too, how this school really led the way to the great school of natural liberty of Adam Smith and his followers. The Physiocrats, however, had marked views as to what was the natural order. Ingram describes these as follows:

"Only those labors are truly 'productive' which add to the quantity of raw materials available for the purposes of man; and the real annual addition to the wealth of the community consists of the excess of the mass of agricultural products (including, of course, metals) over their cost of production. On the amount of this *produit net* depends the well-being of the community, and the possibility of its advance in civilization. The manufacturer merely gives a new form to the materials extracted from the earth; the higher value of the object, after it has passed through his hands, only represents the quantity of provisions and other materials used and consumed in its elaboration. Commerce does nothing more than transfer the wealth already existing from one hand to another; what the trading classes gain thereby is acquired at the cost of the nation, and it is desirable that its amount should be as small as possible. The occupations of the manufacturer and merchant, as well as the liberal professions, and every kind of personal service, are 'useful' indeed, but they are 'sterile,' drawing their income, not from any fund which they themselves create, but from the superfluous earnings of the agriculturist. Perfect freedom of trade not only rests, as we have already seen, on the foundation of natural right, but is also recommended by the consideration that it makes the *produit net*, on which all wealth and general progress depend, as large as possible. *Laissez-faire, laissez-passer* should therefore be the motto of Governments. The revenue of the State, which must be derived altogether from this net product, ought to be raised in the most direct and simplest way—namely, by a single impost of the nature of a land tax."

Their Views.

This last position gives the school an especial interest to social reform as being the forerunner of the modern believers in the Single Tax. The first great Physiocrat was François Quesnay (1694-1774). Altho

by profession a physician and attendant upon Louis XV. and Mme. de Pompadour, he was also a landowner deeply interested in agriculture. In 1756 he wrote the articles *Fermiers*, and one on *Grains* in Diderot and Alembert's *Encyclopédie*, which contain the germ of his system. His famous *Tableau Économique* was printed in 1753. In 1763 he published his *Maximes Générales du Gouvernement Économique d'un Royaume Agricole*. His *Tableau Économique*, though dry and abstract, is perhaps the best statement of the school, with its motto, *peuples paysans, pauvre royaume; pauvre royaume, pauvre roi*. J. C. M. Vincent, M. de Gournay (1712-50), though born after Quesnay, must be associated with Quesnay as a founder, and is said to have influenced Quesnay. He wrote nothing save memoirs addressed to ministers, but in the *Bloge*, which Turgot addressed to his memory, we have a full statement of his views. He was bred as a merchant, as Quesnay was an agriculturalist, and does not agree with the latter that commerce and manufacture are "unproductive." He puts all his emphasis on the struggle for "natural" freedom, and he it is who formulated the phrase *Laissez-faire, laissez-passer*. Quesnay's oldest and most devoted disciple was Victor, Marquis de Mirabeau, the somewhat verbose father of his more famous son. Another earnest and persevering apostle of the system was Dupont de Nemours (1730-1817), known by his treatises *De l'Exportation et de l'Importation des Grains* (1764), *De l'Origine et des Progrès d'une Science Nouvelle* (1767), *Du Commerce de la Compagnie des Indes* (1767), and especially by his more comprehensive work *Physiocratie, ou Constitution Naturelle du Gouvernement le Plus Avantageux au Genre Humain* (1768). It was the title to this book which gave the name to the school. Other interpreters of physiocratic doctrine were Mercier de la Rivière, Baudeau, and Letrosne, Abeille, Condorcet, Bosnier de l'Orme, Bigot de Sainte Croix, Chastellux, and Abbé Morellet.

The greatest name, however, among the followers of this school, and the only one who could put the ideas into practice, was Anne Robert Jacques Turgot (1727-81), for a short time minister of Louis XVI., and perhaps, as Matthew Arnold calls him, "the greatest minister France ever had." (See TURGOT.) Says Cossa:

"Turgot deserves a place quite by himself among the economists of his day, because of the variety and solidity of his attainments, and the versatility in argument displayed in his books, and in the official memorials for which he is responsible.

His fame rests quite as much upon the reforms which he instituted as upon the books which he wrote. His reforms reorganized the national finances, and delivered agriculture from the strait-jacket in which for centuries it had been confined; at least these reforms would have accomplished this, if the weak king had not instantly abolished them, and abandoned his ministry to the mercies of court intriguers, and the opposition of privileged classes. All this made shipwreck of reforms which, though substantially wise, were in themselves foredoomed to failure, because they contained no sufficient provisions for making gradual and partial changes, but contemplated the sudden sweeping away of the old order to make room for the new."

His economic views are explained in the introductions to his edicts and ordinances, in letters and occasional papers, but especially in his *Reflexions sur la Formation et la Distribution des Richesses* (1766).

The last French Physiocrats were Germain, Marquis de Garnier, who published his *Abrégé Élémentaire des Principes de l'Économie Politique* in 1796, and Dutens, whose *Philosophie de l'Économie Politique* appeared in 1835.

Outside of France the main Physiocrats were, in Germany, Karl Friedrich, Markgraf of Baden (1728-1811), Theodor Schmalz (1760-1831), Johann August Schlettwein (1731-1802), Jakob Mauvillon (1743-94). Karl Arnd's *Die Naturgemässe Volkswirtschaft* appeared as late as 1851. In England the Physiocrats had no real following. In Poland, Strojnowski, in Russia, Prince Galitzin (1796), are of this school. The leading Italian Physiocrats are, Melchior Delcico (1788), Nicola Fiorentino, and Neri (1767), besides four writers on the corn laws who came after him: Scottoni (1781), Mario Pagano (1789), De Gennaro, in his *Annona* (1783), and Scrofini in his *Memorie di Economia Politica* (1826); also four writers on finance, viz., Adamo Fabroni, mentioned in 1778 by Balletti, Giuseppe Gorani (1771), Giovanni Paradisi (1789); and above all, Giuseppe Sarchiani, a Tuscan, and author of the pamphlet *Intorno al Sistema delle Pubbliche Imposizioni* (1791).

Turgot.

G. ADAM SMITH, AND THE SCHOOL OF NATURAL LIBERTY.

For a full account of Adam Smith, see article SMITH; for an account of the predecessors and the steps which led up to Adam Smith, see Section E of this article. Adam Smith must by no means be considered the absolute originator of his school; nevertheless he gave it such signal utterance and so influential an impulse as to make him in a very real sense the founder of this, the great school of orthodox English, if not European and American, political economy.

Adam Smith was born in Kirkcaldy, Scotland, June 5, 1723, and studied in his native place, at Glasgow, under Hutcheson (1737-40), and at Balliol College, Oxford, where he remained till 1846. He lived in Edinburgh and read under the patronage of Lord Kames, and in close intimacy with David Hume. In 1831 he was called to the chair first of logic, and then of moral philosophy. In 1759 appeared his *Theory of Moral Sentiments*. In 1764 he vacated his chair, and for two years traveled with the young Duke of Buccleuch, spending nearly a year in Paris, and becoming acquainted with Diderot, A. L. C. Quesnay, and Turgot. Returning to his native Kirkcaldy, he lived there ten years, save for a trip to London, and in the first months of 1776 brought out his great work, *The Wealth of Nations*. The fame won by this got him the appointment of Commissioner of Customs at Edinburgh, where he went in 1778. In 1787 he was elected Lord Rector of Glasgow University, and died July 17, 1790. Cossa says of his book:

"Adam Smith's book is a masterpiece because its author combined rare philosophical powers of insight with rich and varied mental acquirements, and his profound historical knowledge was joined with a phenomenal common sense which enabled him to investigate all his problems from all sides, without ever suffering prejudice to intervene and carry him too far.

His reasoning is alternately deductive and inductive, and his style combines literary charm with scientific apprehensibility, and is accordingly adapted to every heedful and fairly instructed mind. He abounds in historical illustrations, constantly tests his points by appealing to facts, and as a matter of fact all his digressions into questions of justice, education, and soldiering,—found fault with though they are by many on account of their inordinate length, which certainly would suggest an encyclopedia rather than a treatise on one subject,—played their part in making the book popular, and in winning for it the control which it eventually exercised over the course of legislative reform that has prevailed in the leading States of modern times."

Coming to an analysis of this remarkable work, we find that it commences in book i. with the premiss that every appreciable increment of national wealth springs from labor, and then asks what causes enhance this increment; carefully considering the division of labor, the resultant saving of capital to fall back upon, and the widening of the market. This leads to the subject of exchange, and the consideration of (1) value in use, or utility, and (2) value in exchange, constituted by the purchasing power of wages. This latter is studied under the two categories of natural and market value. Then comes the subject of distribution, and the study of differences in wages and profits, with the conclusion that the advancement of wealth increases rents and wages, but diminishes profits. Wealth he defines as the assemblage of material, necessary, convenient, or desirable articles; and to produce wealth is to make materials more useful or valuable. Hence clergyman, magistrates, house servants, etc., are not engaged in productive labor.

Book ii. begins with the distinction between capital and the fund required for daily consumption, and then considers the various forms of capital, mobilized, circulating, etc. Saving creates capital, which supports productive labor, whereas unproductive consumption does not. Money is next discussed, in its various forms, and he censures the confusion of the volume of current money with the rate of interest and favors a legal rate slightly above the current rate, so as to prevent the flow toward speculators and spendthrifts. Agriculture Smith considers the most productive investment, because here, through the

gratuitous cooperation of nature, a surplus arises, making rent possible.

Book iii. sketches a history of industry, with special study of causes favorable to prosperity. Book iv. first criticizes the Mercantilist and Physiocrat theories, and then sets forth Smith's own canons. The ultimate aim of good government is the utmost freedom for the production and circulation of wealth. He attacks all outworn restrictive measures. Yet he appeals to no abstract principle like the Physiocrats, but to expediency and opportunity. He implies, though he does not state, that the play of individual interests will always produce the good of the community. He thinks ever of the consumer's interests, and so desires the cheapening of all articles. He does not however desire a sudden adoption of free trade, and believes that the public health and morals may persistently require the limitations of trade. He would justify temporary grants of monopolies to companies taking great risks.

Book v. concerns the State, whose function is not only negative, but educational, and to carry on all enterprises which are of importance but would not remunerate private enterprise. Revenue he would raise, not from crown lands, but from taxes on consumption and on various forms of rent. He closes with a study of the evils of abusing public credit.

The book is thus wonderfully balanced, but contains hints which less balanced followers have developed into capital errors. He was, however, on the whole, decidedly influenced by his time in criticizing the economic functions of government, and trusting too far to the free play of private interests, under the idea of the old *ius nature*.

Adam Smith was much criticized by the English and French Mercantilists, and the German school of M \ddot{o} ser (see above), who condemned him as rationalistic, individualistic, and materialistic. One of the best criticisms was by J. Lauderdale's *An Inquiry into the Nature and Origin of the Public Wealth* (1804). He based value on utility and sharply criticizes Smith's confusion of public and private wealth.

But Smith soon won distinguished followers. Jeremy Bentham (*q. v.*) declared for him, and wrote *A Manual of Political Economy* and monographs on free trade, public debts, and *A Defense of Usury* (1787).

We now come to the great name of Thomas Robert Malthus (1766-1834). A Protestant clergyman, he taught economics at Haileybury College. (See MALTHUS and MALTHUSIANISM.) Cossa says of Malthus:

"He investigated the economic aspects of population with a masterly idea of the right method of scrutinizing the fundamental principle involved under all existing and widely divergent cases by which it is exemplified. Thus he founded on solid ground a doctrine which, when stripped entirely of its pseudo-mathematical integument and stated with greater precision statistically and psychologically, has held its own up to the present hour against a horde of cavils, which turn for the most part upon a loose employment of terms; it has even weathered the shock given to it by certain incompetent friends who have fastened upon it the heavy burden of their own false conclusions."

The first edition of his work appeared anonymously in 1798 under the title, *An Essay on the Principle of Population, as it affects the Future Improvement of Society, with Remarks on the Speculations of Mr. Godwin, M. Condorcet, and Other Writers*. This book arose out of certain private controversies of its author with his father, Daniel Malthus, who had been a friend of Rousseau, and was an ardent believer in the doctrine of human progress as preached by Condorcet and other French thinkers and by their English disciples. The book was a polemic. Godwin (*q. v.*) had held that evils in society arise from human institutions, which should be replaced by a natural equality for all. Malthus, following a work by Dr. Robert Wallace in 1761, showed that the tendency of population to rapidly increase made equality impossible. The result was brilliant, but crude. He attempted to prove that population increases in a geometrical, food in an arithmetical, ratio. His success led to his writing a second edition, which is practically a new book, carefully eradicating the crudities of the first edition, not attempting to formulate any mathematical law, but from abundant instances to cautiously show the general tendency of population to outstrip the means of support.

His Critics.

Adam Smith.

Malthus.

The book, so altered, appeared in 1803, under the title, *An Essay on the Principle of Population, or a View of its Past and Present Effects on Human Happiness; with an Enquiry into our Prospects respecting the Future Removal or Mitigation of the Evils which it Occasions.*

There is one important addition. In the former edition the author had spoken of no checks to population save those of wars, misery, and vice. He now speaks of "moral restraint," and so is able to soften some of the harshest conclusions of the first edition. The book passed through six editions in Malthus' lifetime, and he constantly introduced corrections. The last edition was that of 1817.

The impression made by Malthus' book was largely due to the times in which it appeared. Adam Smith had written at the beginning of an industrial revolution. The only steam-engine he refers to is Newcomen's, and of the cotton trade he makes but one mention. "Between the years 1760 and 1770," says Mr. Marshall, "Roebuck began to smelt iron by coal, Brindley connected the rising seats of manufactures with the sea by canals, Wedgwood discovered the art of making earthenware cheaply and well, Hargreaves invented the spinning jenny, Arkwright utilized Wyatt's and High's inventions for spinning by rollers and applied water power to move them, and Watt invented the condensing steam-engine. Crompton's mule and Cartwright's power-loom came slowly after."

The result of all this invention was a rush into manufacturing. Capitalists who could own factories made money at the rate of several hundred per cent. Agriculture was neglected and hand production killed. The unemployed from Ireland, as well as from all England, poured into the factory towns. Machines enabled the owners to employ women and children instead of men. Parishes sold their pauper children to the factories. There were no trade-unions to keep wages up; there were no laws to prevent long hours or child labor. The horrors of English factory and agricultural life at this time beggar description. Men were housed like animals and fed like swine. Children of five or six worked

The Industrial Revolution.

long hours. Drunkenness and every evil abounded. Some have argued that at no period in English history was the condition of the English laborer worse than during the last decade of the eighteenth century and the first of the nineteenth. Competition was absolutely unlimited. Meanwhile, Adam Smith's book seemed to show the wisdom of absolute freedom. It was a comfort, therefore, to have Malthus prove that population, by a law of nature, tended to increase faster than the means of subsistence and that, therefore, some must perish. It seemed to excuse the suffering of the poor and still any prickings of capitalistic consciences. Malthus had met a need. Between Adam Smith and Malthus the employee was helpless—free to slave, free to suffer, and free to die. Adam Smith and Malthus furnished the economic orthodoxy of the day; an orthodoxy not yet overthrown, though very largely undermined. But it was to be developed. Malthus himself wrote other works.

But we now come to the third great name in the school of English orthodox economists, that of David Ricardo (1772-1823). Ricardo was the son of a Jewish merchant, carefully educated for business. He himself, however, became a Christian, and turned a banker of unimpeachable honesty and great success. The study of the *Wealth of Nations* made him an economist. In 1810 he entered Parliament as an authority on finance. In 1821 he was one of the founders of the Political Economy Club.

Ricardo.

His great work, however, was his *Principles of Political Economy* (1817), a work which Cossa calls "of originality and profundity so remarkable that it marks an epoch in the history of our science, tho its good points are overstated by such enthusiastio partizans as MacCulloch and De Quincey."

Ricardo was a pure theorist. He develops Adam Smith's hints and fundamental positions, with keen logic, simply as matters of pure science. "He, therefore, comes to conclusions which Adam Smith's balance of a mind full of facts saved him from making. Ricardo carries many of the points so far as to make them assume positions entirely new, and which may be truly said to be original with Ricardo. Primary among these is his view of value and his famous law of rent. (See RICARDO and RICARDIAN LAW OF RENT.)

With Ricardo, the great primal stage of the *laissez-faire* economy is complete. The works of Adam Smith, Malthus, and Ricardo went through all Europe, creating everywhere a new awakening of economic thought and often such admiration as for a time almost to check further independent thought. As late as 1869 Rau, in Germany, wrote: "The fundamental ideas of Adam Smith are derived so directly from the nature of things that later investigations only furthered the gradual internal development of his system without establishing a new one; hence, the political economy of to-day, altho by no means confined any longer to the content of the doctrines formulated by Adam Smith, is nevertheless regarded as his system."

Of French orthodox political economy, Léon Say wrote in 1884: "The science has neither in practise nor in theory shown a growth equal to that of the demands made upon it. One does not even take the trouble to combat on scientific or political grounds the ideas which come from Germany; our economists slumber in indolent optimism on the cushion of *laissez-faire*."

The school of Adam Smith governed economic thought down to 1870, and everywhere it created a school of writers. We from this time must study economic thought by countries.

H. ENGLAND.

Contemporary with Adam Smith was another Scotchman, James Anderson, who died in 1808. In a footnote to his *An Enquiry into the Nature of the Corn Laws* (1777), he puts the whole principle of rent clearly and concisely. Much better known was James Mill (1773-1830). In his *Elements of Political Economy* (1821) he seems to sum up, altho dryly and without interest, all the Ricardian economics. John Ramsay McCulloch (1789-1864), another Scotchman, was a more popular, but less accurate writer. His *Principles of Political Economy* (1825), *Dictionary of Commerce*, and treatise on Taxation contain nothing original, and are now of little value, but in their day did considerable to spread the Ricardian economics. Colonel Robert Torrens (1780-1864) is a better representative of the school, and a prolific writer.

Two prominent clergymen are among the economists of this school and time. The Anglican Archbishop of Dublin, Richard Whately, having been professor at Oxford, and being the author of excellent lectures introductory to political economy (1831), finally founded a chair of economics at Trinity College, Dublin, which was creditably filled by Longfield, his successor, Lawson, and then by Cairnes.

Professor Ingram says of Whately: "He published lectures on the science generally (1835), on *Poor Laws* (1834), and on *Commerce and Absenteeism* (1834), which were marked by independence of thought and sagacious observation. He was laudably free from many of the exaggerations of his contemporaries. He said, in 1835, 'In political economy we must not abstract too much,' and protested against the assumption too often made that 'men are guided in all their conduct by a prudent regard to their own interest.'"

The second clergyman, Thomas Chalmers of Glasgow, well known in other lines of thought, was no mean economist, tho principally famous in this line for his successful efforts in charity organization restriction in Glasgow. (See CHALMERS.) In his *The Christian and Civic Economy of Large Towns* (1821-36), and *On Political Economy in Connection with the Moral State and Moral Prospects of Society* (1832), he strongly opposes legal charity; and, while justly insisting on the primary importance of morality, industry, and thrift as conditions of popular well-being, carried the Malthusian doctrines to excess.

Undoubtedly, however, the greatest writer of the strict Ricardian school, after Ricardo himself, was Nassau William Senior (1790-1864), Professor of Political Economy at Oxford. Senior analyzed the cost of production most ingeniously, but his choice of the curious term "abstinence" (for describing that element in the cost of production which depends upon capital accumulated by self-denial) was unfortunate, since it gave rise to objections and controversies that turned entirely upon words. Equally important were his researches into the measure of wages and of profits, and, in general, into the whole terminology of economics. He was among the first in England to aim at accuracy and precision in this matter.

Senior.

Of less importance are Harriet Martineau (1802-76), who popularized Ricardo and Malthus in her *Illustra-*

tions of Political Economy (1832-34); Charles Babbage, *On the Economy of Machinery and Manufactures* (1832); Herman Merivale, *Lectures on Colonization and Colonies* (1841-42); T. C. Banfield, *The Organization of Industry Explained* (1844); and Edward Gibbon Wakefield, *A View of the Art of Colonization* (1849). All these are of the Ricardian school. The main English contemporary critic of Ricardo was Richard Jones (1790-1855), professor at Haileybury.

Ingram says of him: "Jones has received scant justice at the hands of his successors. J. S. Mill, while using his work, gave his merits but faint recognition. Even Roscher says that he did not thoroughly understand Ricardo, without giving any proof of that assertion, while he is silent as to the fact that much of what has been preached by the German historical school is found distinctly indicated in Jones' writings. He has been sometimes represented as having rejected the Andersonian doctrine of rent; but such a statement is incorrect. . . .

Jones.

What he really denied was the application of the doctrine to all cases where rent is paid; he pointed out in his *Essay on the Distribution of Wealth and on the*

Sources of Taxation (1831), that, besides "farmers' rents," which, under the supposed condition, conform to the above law, there are "peasant rents," paid everywhere through the most extended periods of history, and still paid over by far the largest part of the earth's surface, which are not so regulated. Peasant rents he divided under the heads of (1) serf, (2) métayer, (3) ryot, and (4) cottier rents, a classification afterward adopted in substance by J. S. Mill; and he showed that the contracts fixing their amount were, at least in the first three classes, determined rather by custom than by competition. Passing to the superstructure of theory erected by Ricardo on the doctrine of rent which he had so unduly extended, Jones denied most of the conclusions he had deduced.

Jones is remarkable for his freedom from exaggeration and one-sided statement; thus, while holding Malthus in, perhaps, undue esteem, he declines to accept the proposition that an increase of the means of subsistence is necessarily followed by an increase of population."

We come now to undoubtedly one of the greatest names in English economics, John Stuart Mill (1806-73). Of the orthodox school, he yet so far worked his way out of the orthodox economics as in his *Autobiography* to announce himself a socialist. This mere fact indicates a mental progress and, perhaps, inconsistencies that make it impossible to present his views in brief space.

Cossa says of Mill:

"Few influences of the kind have been more widespread among educated Englishmen, or found more approbation among the cultivated classes everywhere, than that exercised by his *Principles of Political Economy*, a book which summarizes and systematizes under their more important aspects, and in the most exact language possible, all the leading doctrines of the classical English school.

J. S. Mill.

Nor does this author fail, where necessary, to strengthen these views by completing them, so that there is no better account than his"; yet Cossa also says:

"But Mill's work requires a thorough understanding before you can away with the extraordinary inconsistencies and contradictions in which it abounds. . . . Self-contradiction lurks in the ever-widening and deepening vein of genial philanthropy, visible in the successive editions of Mill's *Principles*, until in the third he draws in the most rosy hues a prophetic picture of the days in store for the working classes, and actually proclaims his belief in the eventual consummation of socialism; but this philanthropy never quite carried him off his feet until he wrote his posthumously published chapters on socialism. Self-contradiction also lurks in his proposal to bar the right of collateral kindred to inherit, and also in his sympathy with the idea of heavy taxes to be imposed upon vexatious transfers of landownership, which culminated in the later years of his life in his marvelous scheme for confiscating the future rents of land which were to be acquired at current prices by the State with the owner's consent. But his self-contradiction is most palpable and can best be understood, from the point of view of science, when these socialistic aspirations are confronted with his theoretical adhesion to the doctrines of Malthus. These he not only maintained, but almost caricatured, by proposing the restriction of marriages by law. Again, how are we to reconcile his approval of a stationary state, which is really a retro-

gressive condition of decadence, with his unwavering belief in unlimited progress? He should either part company with Laing, reject Thornton's *plea for Peasant Proprietors* (1848; second edition, 1874), and refrain from glorifying small peasant-holdings, or else he must retract his own *Papers on Land Tenure (Dissertations and Discussions*, vol. iv.), and destroy all record of his own usefulness as president, from 1870 on, of the Land Tenure Reform Association. Finally, what can Mill the socialist, pledged as such against every form of competition, have to do with the Mill who defended 'cooperative societies for production,' and thus endeavored to replace competition between private enterprises by competition between associations of working men?"

Such a writer we shall not undertake to condense; only a brief account can be given. (For a full account, see MILL.) Born in 1806, and submitted by his father to a phenomenal intellectual discipline, he could read Greek and Latin at eight, and before the age of 20 became a close friend of Bentham, Austin, Grote, and Macaulay. In Paris he had met Say and St. Simon. From 1823 to 1853 he held a post in the India Office. From 1865 to 1868 he was M. P. for Westminster, but offended his constituents by his independent attitude. He died in retirement at Avignon, 1872. Committed at the outset to Benthamism, in 1826 he began to change to a more socialistic view. His acquaintance with Mrs. Taylor, beginning in 1831 and ending in marriage in 1851, rapidly developed his mental change. From 1841-46 he was under the influence of Comte. He in later life zealously espoused Agrarian Reform, Minority Representation, and Woman's Suffrage. Mill's main economic contributions were *Essays on some Unsettled Questions of Political Economy* (written in 1829-30, and published 1844), *Principles of Political Economy, with Some of their Applications to Social Philosophy* (1848), *Dissertations and Discussions, Comte and Positivism* (1865), *England and Ireland* (1868), *on Representative Government* (1861), *on the Subjection of Women* (1869), *on Socialism*, published after his death in the *Fortnightly Review* (1874). His five essays contain his main original contributions to economics: Essay I. contains his famous doctrine of free international commerce; Essay II. his argument that absenteeism is a purely local evil; that tho a general glut is permanently impossible, it may be temporarily general; that this comes, however, not from over-production, but from impaired credit; Essay III. discusses productive and unproductive labor and consumption; Essay IV. discusses Ricardo's theory of the connection between wages and profits, showing that the latter depend upon the cost of the work. Essay V. discusses methods in economics, which must be inductive.

The marked points in Mill's *Political Economy* are (1) his analysis of the influence of progress; (2) his observation that profits tend to a minimum; (3) his remarks concerning a stationary condition of economic forces; (4) his famous distinction between the physical character of the laws governing production and the social character of those governing distribution. This last Mill himself regarded as his greatest contribution to economics, a view to-day not accepted.

Mill's *Autobiography* is of peculiar interest to social reform. Of it Ingram says:

"The gradual modification of his views in relation to the economic constitution of society is set forth in his *Autobiography*. In his earlier days, he tells us, he 'had seen little further than the old school' (note this significant title) of political economy into the possibilities of fundamental improvement in social arrangements. Private property, as now understood, and inheritance appeared the *denier mot* of legislation. The notion of proceeding to any radical redress of the injustice 'involved in the fact that some are born to riches and the vast majority to poverty' he had then reckoned chimerical. But now his views were such as would 'class him decidedly under the general designation of socialist'; he had come to believe that the whole contemporary frame-work of economic life was merely temporary and provisional, and that a time would come when 'the division of the produce of labor, instead of depending, as in so great a degree it now does, on the accident of birth, would be made by concert on an acknowledged principle of justice.' 'The social problem of the future' he considered to be 'how to unite the greatest individual liberty of action,' which was often compromised in socialistic schemes, 'with a common ownership in the raw material of the globe, and an equal participation in all

Ingram on
Mill.

the benefits of combined labor. These ideas were scarcely indicated in the first edition of the *Political Economy*, rather more clearly and fully in the second, and quite unequivocally in the third—the French Revolution of 1848 having, as he says, made the public more open to the reception of novelties in opinion.

"Whilst thus looking forward to a new economic order, he yet thinks its advent very remote, and believes that the inducements of private interest will in the meantime be indispensable. On the spiritual side he maintains a similar attitude of expectancy."

Among the more prominent of English economists after Mill, is John Elliot Cairnes (1824-75), professor at Trinity College, Dublin, and at University College, London. He was a great worker, but deficient in sympathy, and therefore somewhat one-sided. He largely developed the question of economic method. His book on *Method* (1857) for over 20 years had no rival. In 1862 he published *The Slave Power; Its Character, Career, and Probable Designs*; showing from an economic standpoint the evils of slave labor and creating a deep impression. His *Essays on Political Economy* were published in 1873, and in 1874 his important *Some Leading Principles*

Cairnes.

of *Political Economy Newly Expounded*. It contains however little new, merely amending some of the positions of Mill and others. He adopts the wages fund theory, which Mill had thrown away. He favors co-operation and shows that American highly paid labor need not fear European low paid labor.

Most closely connected with Mill is Henry Fawcett (1833-84). Altho blind he was professor at Cambridge, an M. P., and in 1880 made Postmaster-General. His *Manual of Political Economy* (1863) has been much used as a text-book, and has been adapted by his wife, Mrs. M. G. Fawcett, into a *Political Economy for Beginners* (1870), also much used.

But the newer thought that begins to show itself in Mill was to attain more development than in Cairnes and Fawcett.

William Thornton (1813-80) had already attacked the theory of value and of the wages fund, and in many ways criticized the orthodox economy; and altho doing but little to point a way out, presenting facts to show the unhappy condition of the English laborer. In this way his *Overpopulation and its Remedy* (1846); *On Peasant Proprietors* (1848); and *On Labor, its Wrongful Claims and Rightful Dues*, are helpful books. But more positive thought was to develop. Robert Owen (1771-1858), the Chartists, and others (see ENGLAND) had, from 1817 on, awakened considerable utopian radical social thought. (See SOCIALISM.) William Thompson, one of Owen's followers, who died in 1833, had practically formulated what is Marx' theory of surplus value, as early as 1824, in his *Inquiry into the Principles of the Distribution of Wealth*. John Gray (1821), Edmonds (1828), J. B. Bray (1830), and Charles Bray (1841) developed similar thoughts. The writings, too, of Carlyle and Ruskin affected the economists more than they were willing to admit; but, especially, the violent condemnation of the soulless Manchester or orthodox political economy by Maurice, Kingsley, and the other Christian Socialists set the economists thinking. The tendency to break away from old theoretical abstractions was much quickened by the development in Germany of the historical school (see Section J of this article). One of the first economists in England to voice the newer thought was Walter Bagehot (1826-77). Author of an excellent

Bagehot.

work on the English money market, *Lombard Street* (1873), of several monographs on monetary questions, and of some general economic essays collected in *Economic Studies*, edited by R. H. Hutton (1880), he described himself as "the last man of the ante-Mill period," but he was more truly the first man to feel the influence of the historical school. With this he had "no quarrel, but rather much sympathy." "Rightly conceived," he said, "it is no rival to the abstract method rightly conceived." "Mill and Cairnes," says Ingram, "had already shown that the science they taught was a hypothetical one, in the sense that it dealt not with real but with imaginary men—'economic men' who were conceived as simply 'money-making animals.'" But Bagehot went further: he showed what those writers, tho they may have indicated, had not clearly brought out, that the world in which these men were supposed to act is also 'a very limited and peculiar world.' What marks off this special world, he tells us, is the promptness of transfer of capital and labor from one employment to another, as determined by differ-

ences in the remuneration of those several employments—a promptness, about the actual existence of which in the contemporary English world he fluctuates a good deal, but which on the whole he recognizes as substantially realized."

"The object of his economic studies," Ingram says, "was to show that the traditional system of political economy—the system of Ricardo and J. S. Mill—rested on certain fundamental assumptions, which, instead of being universally true in fact, were only realized within very narrow limits of time and space. Instead of being applicable to all states of society, it holds only in relation to those 'in which commerce has largely developed, and where it has taken the form of development, or something like the form, which it has taken in England.' It is 'the science of business such as business is in large and trading communities—an analysis of the great commerce by which England has become rich.' But more than this it is not; it will not explain the economic life of earlier times, nor even of other communities in our own time; and for the latter reason it has remained insular; it has never been fully accepted in other countries as it has been at home. It is, in fact, a sort of ready reckoner, enabling us to calculate roughly what will happen under given conditions in Lombard Street, on the Stock Exchange, and in the great markets of the world. It is a 'convenient series of deductions from assumed axioms which are never quite true, which in many times and countries would be utterly untrue, but which are sufficiently near to the principal conditions of the modern 'English' world to make it useful to consider them by themselves.'"

More advanced was T. E. Cliffe Leslie (1827-82). Of him Ingram says: "The first systematic statement by an English writer of the philosophic foundation of the historical method, as the appropriate organ of economic research, is to be found in an essay by T. E. Cliffe Leslie (printed in the Dublin University periodical, *Hermathena*,

Cliffe Leslie.

1876; since included in his *Essays, Moral and Political*, 1870). This essay was the most important publication on the logical aspect of economic science which had appeared since Mill's essay in his *Unsettled Questions*. Tho Cairnes had expanded and illustrated the views of Mill, he had really added little to their substance. Leslie takes up a position directly opposed to theirs. He criticizes with much force and verve the principles and practise of the 'orthodox' school. Those who are acquainted with what has been written on this subject by Knies and other Germans, will appreciate the freshness and originality of Leslie's treatment. He points out the loose and vague character of the principle to which the classical economists profess to trace back all the phenomena with which they deal—namely, the 'desire of wealth.' This phrase really stands for a variety of wants, desires, and sentiments, widely different in their nature and economic effects, and undergoing important changes (as, indeed, the component elements of wealth itself also do) in the several successive stages of the social movement. The truth is that there are many different economic motors, altruistic as well as egoistic; and they cannot all be lumped together by such a coarse generalization. The *a priori* and purely deductive method cannot yield an explanation of the causes which regulate either the nature or the amount of wealth, nor of the varieties of distribution in different social systems, as, for example, in those of France and England. 'The whole economy of every nation is the result of a long evolution in which there have been both continuity and change, and of which the economical side is only a particular aspect. And the laws of which it is the result must be sought in history and the general laws of society and social evolution. The intellectual, moral, legal, political, and economic sides of social progress are indissolubly connected. Thus, juridical facts relating to property, occupation, and trade, thrown up by the social movement, are also economic facts. And, more generally, 'the economic condition of English' or any other 'society at this day is the outcome of the entire movement which has evolved the political constitution, the structure of the family, the forms of religion, the learned professions, the arts and sciences, the state of agriculture, manufactures, and commerce.' To understand existing economic relations we must trace their historical evolution; and 'the philosophical method of political economy must be one which expounds that evolution.' This essay was the most distinct challenge ever addressed to the ideas of the old school on method, and, tho its conclusions have been protested against, the

arguments on which they are founded have never been answered."

An Irishman by birth, Leslie was a barrister and professor at Belfast. His writings are mainly essays (1888) and articles in various reviews.

More important is William Stanley Jevons (1835-82). Born at Liverpool, assayer in the Mint at Sydney (1854-59), professor at Manchester (1866-76), and in University College, London (1876-81), his experience gave him many-sidedness and balance. His *A Serious Fall in the Value of Gold* (1863) and the *Coal Question* (1865) were his first important works. His *Money and the Mechanism of Exchange* (1875) is one of the best treatises on that subject, from a conservative position (Jevons being a moderate monometallist). More progressive are his *The State in Relation to Labor* (1882) and *Methods of Social Reform* (1883). Jevons would have State action developed not on any doctrinaire principle, for or against, but experimentally; learning from this experience what the State can do best and what the individual. He sought to work out the conception of final utility. Altho apt in statistics and mathematics, he can be also popular, as in his *Primer of Political Economy* (1878).

Jevons.

Of the same school is J. E. Thorold Rogers, professor at Oxford. His six-volume *History of Agriculture and Prices, 1250-1702* (1866-87); his one-volume *Six Centuries of Work and Labor* (1884); his two-volume *Industrial and Commercial History of England* (1891) are monuments of patient investigation and full of facts, if economists pay little heed to the conclusions he draws from them. Commencing his studies opposed to trade-unions, he was by his historic studies converted to a reasonable trade-unionism.

But most progressive of all this school was the brilliant Arnold Toynbee (1825-83). Best known for the impetus he gave to university residence among the poor, commemorated in Toynbee Hall (*q. v.*), his fragmentary writings on economic history printed as *Lectures on the Industrial Revolution in England* (1884), have made many regret his early death, altho the scientific value of his writings is questioned by such men as Cossa.

Ingram says of him:

"He had a belief in the organizing power of democracy which it is not easy to share, and some strange ideas due to youthful enthusiasm, such as, for example, that Mazzini is 'the true teacher of our age'; and he fluctuates considerably in his opinion of the Ricardian political economy, in one place declaring it to be a detected 'intellectual imposture,' whilst elsewhere, apparently under the influence of Bagehot, he speaks of it as having been in recent times 'only corrected, restated, and put into the proper relation to the science of life,' meaning apparently, by this last, general sociology. He saw, however, that our great help in the future must come, as much had already come, from the historical method, to which in his own researches he gave preponderant weight. . . . If, as we are told, there exists at Oxford a rising group of men who occupy a position in regard to economic thought substantially identical with that of Toynbee, the fact is one of good omen for the future of the science."

Coming to contemporary authors, easily the first place is occupied by Professor Alfred Marshall, who in 1885 was called to succeed Professor Fawcett at Cambridge. Cossa calls him "the first English name in contemporary economic thought," and says:

"Alike as a teacher and as a writer, Professor Marshall has given proofs of an acute mind, a many-sided and well-digested familiarity with economic theories, a point of view regarding method which is at once comprehensive and accurate, and a power to measure justly the theories of the classical school.

Of that school he is the representative and heir, for he follows the traditions of Adam Smith, allowance being made for altered views and circumstances. Like Jevons, but with more balance, he utilizes mathematics; like Rogers and Cliffe Leslie, he favors historical studies; and finally, with Giffen, he appreciates statistical induction, at the same time giving fair warning that bare facts which are facts only, and not welded together by theoretical inductions, are mute and unintelligible. The special field of his work has been the theory of value." Nevertheless, altho of the classical school, he is so inclined to advanced social views as often to be called a socialist. His *Economics of Industry* (1879), written with the aid of his wife Mrs. Mary Paley Marshall, has replaced Mrs. Fawcett's book for beginners and strikes a much

Marshall.

more advanced note. His chief work, however, is his *Principles of Economics* (vol. i., 1890), a collection of monographs; among others his important *Some Aspects of Competition*. His *Elements of Economics of Industry* (1892) is an abridgment of the *Principles*. Cossa says of his general views:

"Marshall's ideas on the working man and his condition, on the causes regulating demand for labor and for products, and on the right limits of State interference on behalf of classes living in straitened circumstances, are beyond all commendation, so that a great gulf is fixed between them and the extremes of socialism on the one hand, and of individualism on the other."

Perhaps next to Marshall stands another Cambridge man, Henry Sidgwick, Professor of Moral Philosophy, best known for his *Methods of Ethics* and *History of Ethics*, his *Principles of Political Economy* (1883), and *Elements of Politics* (1891). Professor Ingram says of him:

"It is impossible not to respect and admire the conscientious and penetrating criticism which he applies to the *a priori* system of economics in its most mature form. But it is open to question whether the task was wisely undertaken. It cannot be permanently our business to go on amending and limiting the Ricardian doctrines, and asking by what special interpretations of phrases or

Sidgwick.

additional qualifications they may still be admitted as having a certain value. The time for a new construction has arrived; . . . It is interesting to observe that the part of the work which is, and has been recognized as, the most valuable is that in which shaking off the fictions of the old school, he examines independently, by the light of observation and analysis, the question of the industrial action of governments."

Among the leading economists must be mentioned Professor Ingram himself, from whom we have so often quoted. John Kells Ingram, professor at Trinity College, Dublin, and an Irishman himself, is a Comtist and most opposed to the classical school. His *Present Position and Prospects of Political Economy* (1878), and his article on political economy in the *Encyclopædia Britannica*, since expanded into his *History of Political Economy*, are the best English works on the subject, and markedly trace the development of economic thought in the socialist direction. Professor H. S. Foxwell, who now occupies the chair left vacant by Jevons' death, has attained considerable distinction by editing Jevons' posthumous works, as well as by several essays, like his *Fluctuations of Employment*. He is now engaged with a vast bibliographical work, of which much is expected.

Latest Writers.

Among writers prominent in certain fields of economic thought Professor William Cunningham, with his *Politics and Economics* (1885) and *The Growth of English Industry and Commerce* (vol. i. *The Early and Middle Ages* (1890), vol. ii. *Modern Times* (1892)), stands foremost in economic history. Philip H. Wicksteed, with his *Alphabet of Economic Science* (pt. i., 1888), has developed and lucidly presented Jevons' theory of value. D. G. Ritchie of Oxford has written many valuable articles. His *Darwinism and Politics* is an able answer to the position sometimes taken that Darwinism is opposed to the collectivist position. Professor J. S. Nicholson of the University of Edinburgh has attracted attention by his *The Effects of Machinery on Wages* (1878), *Tenant's Gain not Landlord's Loss* (1883), *Principles of Political Economy*, vol. i. (1893), *Historical Progress and Ideal Socialism* (1894). The Rev. Professor J. E. Symes' *Short Text-book of Political Economy* (1888) has won praise in progressive circles, while E. C. K. Gonner's *Political Economy* (1884) and E. Cannan's *Elementary Political Economy* deserve mention among small text-books. James Bonar has shown much learning in discussing the new Austrian theory of value, while W. Smart is the translator of Böhm-Bawerk. Professor F. Y. Edgeworth, the successor of Rogers at Oxford, is perhaps first in economic investigations based on mathematics. The chief modern English work on monetary questions is Goshen's *The Theory of Foreign Exchange* (1861). J. S. Nicholson (*A Treatise on Money*, 1888), Seyd, Barbour, and Hucks-Gibbs have defended bimetalism as Jevons did monometallism. Ingram calls Professor W. E. Hearn's *Plutology* (1864) "one of the ablest extant treatments of the subject of production. L. T. Hobhouse's *The Labor Movement* and W. D. Hobson's *Evolution of Capital* have elicited no little attention. Likewise C. F. Bastable's *Commerce of Nations* (1892), *Public Finance* (1892), and E. Cannan's *Production and Distribution*.

Of older books on money Cossa mentions the following: Lord Liverpool's *Treatise on the Coins of the Realm* (1805); Thomas Tooke's *A History of Prices and of the State of Circulation from 1792-1836* (London, 1838-57, 6 vols.); H. D. Macleod's *Theory and Practice of Banking* (fourth edition, 1885, 2 vols.); Hankey's *The Principles of Banking*; the largely statistical labors of R. H. Inglis Palgrave on the *Bank-rate in England, France, and Germany, 1844-78* (1880); Bagehot's fascinating work, *Lombard Street, a Description of the Money Market* (1873); S. Jones Lloyd's tracts and other publications on metallic and paper currency (1858), and John Fullerton's *On the Regulation of the Currency* (1844).

Among the earlier productions on financial reform, he mentions: Sir John Sinclair's *History of the Public Revenue* (third edition, 1803-04, 3 vols.); Robert Hamilton's *The Rise and Progress, the Redemption . . . of the National Debt* (third edition, 1818); Sir Henry Parnell, *On Financial Reform* (fourth edition, 1822); Taylor's *History of the Taxation of England* (1853); Hubert Hall's *History of the Customs Revenue* (1885); and Stephen Dowell's monumental *History of Taxation in England* (1884-85, 4 vols.; second edition, 1888). Then there were also Sayer's *On the Income Tax* (1831); Buchanan's *Inquiry into Taxation* (1844); and to these may be added certain more recent works, like Baxter's *Taxation of the United Kingdom* (1869); Noble's *The Queen's Taxes* (1870); Sir Morton Peto's writings; Giffen's *Essay on Finance* (second edition, 1880); and Wilson's *The National Budget* (1882). On local taxation Palgrave (1871), Goschen (1872), and Probyn (1875; second edition, 1885) have set forth their views, and, finally, some place here should be found for mentioning Mr. Gladstone's *Financial Statements* (1867-70, 3 vols.), and the admirable works of Newmarch (*On the Loans raised by Mr. Pitt*, 1855); of Capp (*The National Debt Financially Considered*, 1859); and of Baxter (*National Debts*, 1871).

(Concerning the literature of social reform, see articles SOCIALISM, COOPERATION, etc., etc.)

Of the general state of economic science in England Cossa says: "The very vehemence of opposition shown during the last twenty years to the leading ideas of economics has been a blessing in disguise, since men well versed in it have been constrained to redouble their efforts to be sound and accurate in all things. It may, in fact, be confidently predicted that this period of incubation will clear the way for new triumphs, since the signs of their speedy coming are visible even now. In England, however, the diffusion of economic instruction goes on in lines quite different from those pursued in Germany and Italy, where professors at universities have matters all their own way. Not so in England, where a number of 'Reviews,' devoted to

Reviews.

general culture, are constantly applying the principles of economic science to questions of practical utility as they arise from time to time. The *Quarterly* and the *Edinburgh Review*, traditionally identified with the Tories and Whigs respectively; the *Westminster Review*, anciently the organ of radicalism; the *Fortnightly*, the *Contemporary*, the *National Review*, and the *Nineteenth Century*, representing either liberalism or a strict and impartial neutrality—all these periodicals, as well as many minor ones of great merit, are well supported and widely read. Specialists have very few organs, but the *Economist*, a weekly journal founded in 1843, and devoted to economics and politics, still maintains its ancient prestige, and goes on with its discussions about commerce, banking, and money, and there is also the old-established quarterly *Journal of the Statistical Society*, which celebrated the fiftieth anniversary of its foundation in 1885."

To these he adds *The Economic Review* (1891); *The Economic Journal* (edited by Edgeworth, 1891); R. H. Inglis Palgrave, *Dictionary of Political Economy* (1891 ff.).

The best history of purely English political economy is L. L. Price's *A Short History of Political Economy in England, from Adam Smith to A. Toynbee* (London, 1891).

I. FRANCE.

French political economy, after the school of the Physiocrats had lost ground, became dominated by the school of Adam Smith. In many respects it even out-orthodoxed the English school itself. Say, Rossi, Bastiat,

Michel Chevalier, Garnier, Cherbuliez, Léon Say, Courcelle-Seneuil, Block represent an undeviating following and a popular development of the school of natural liberty that cannot be matched in any other country, certainly not in England. Mill early turned the English channel into more independent lines.

The first important name is that of Jean Baptiste Say (1767-1832). Born at Lyons, he was successively a clerk, a journalist, an active politician, and a professor of political economy at the Paris Conservatoire.

Cossa says of him: "Though not a few still choose to deny it, he certainly was an able successor of the great Scotch master, whose views he expanded and did much to complete. From the moment he produced his *Traité* (1803), which he corrected and summarized in his *Catechisme* (1817), and enriched with a whole chapter of new considerations on private industries in his *Cours Complet* (1828),—this last being in substance the lectures given by him at the Conservatoire,—Say gave signal proofs of his preeminent aptitude for presenting correctly, clearly, and in shapely form the whole body of doctrine embraced by economics strictly so called. His definitions are sound, and he points them with suitably chosen practical instances, grouping them by means of his famous triple subdivision of the subject-matter involved, and adapting them to the understanding of average minds incapable of coping with Adam Smith's long digressions, or of appreciating his historical learning and his lofty point of view. Our author's limitations grow out of a weak desire that tormented him to be ranked first among living economists, and a deficient education in history and law, which exposed him to dangerous pitfalls and misled him into erroneous views touching State interference. This he undertakes to restrict far more than Adam Smith when he discusses the unproductiveness of public expenditures and free coinage. These characteristic shortcomings had further the negative effect of preventing him from making due allowance for the progress that had been made, especially in England, and through Ricardo's able work."

Of the same period and school as Say are several minor names Cossa mentions. Isnard's *Traité des Richesses* (1781); Canard's *Principes d'Economie Politique* (1802); Sismond's *De la Richesse Commerciale* (1802). Count Destutt de Tracy's *Traité d'Economie Politique* (1815), and Joseph Droz's *Economie Politique* (1829); and more important still Heinrich Storch's *Cours d'Economie Politique* (1815), written in St. Petersburg for his pupils, the Grand Dukes Nicholas and Michael of Russia; his *Considerations sur la Nature de Revenu National* (1824); and Charles Comte's *Propriété* (1834), and *Traité de Législation* (1827).

We come to a greater name in that of Pelligrino Rossi (1787-1848). Born in Carrara and assassinated in Rome, an expert in Switzerland on criminal law, he succeeded Say in his chair at Paris, but soon wandered off on a diplomatic career. His successor was Michel Chevalier (1806-79). Once of Saint Simon's school and editor of the *Globe*, he was as skilful an economist, as expert as an engineer. He devoted himself to applied economics, particularly as to money. He is especially known to English readers for *La Baisse d'Or* (1858), translated by Cobden. An ardent free-trader, he was associated with Cobden in negotiating the treaty of 1860. In 1848 he attacked socialism in his *Lettres sur l'Organisation du Travail*. Against his brother-in-law Louis Wolowski (1810-76), he defended the single gold standard in *La Question des Banques* (1864). A friend of international exhibitions, he wrote *Les Brevets d'Invention* (1878). Against local dues he wrote *L'Industrie et l'Octroi de Paris* (1867). Of the same school is Joseph Garnier (1813-81), whose *Elements of Political Economy* appeared in 1845.

Cossa says of him: "Garnier shared in founding—and was for many years chief editor of—the *Journal des Economistes*, as well as of the *Annuaire de l'Economie Politique*; he also produced numerous books, duly enumerated by Lippert. His *Elements* passed through various vicissitudes in successive editions, and emerged with a new title as a *Traité*. He gradually added complementary volumes on finance and on population, and these formed a valuable, if not a profound, series of books for the advancement of economic study. Of the same character and general cali-

Say.

ber is the *Dictionnaire d'Économie Politique* (1851 ff., 2 vols.), published by Guillaumin and edited by Charles Coqueulin, who died upon its completion, but not without publishing a lively pamphlet, all his own, *Du Crédit des Banques* (1848; third edition, 1875). Coqueulin's *Dictionary* enlisted the collaboration of a number of competent experts, and was for very many years the model encyclopedia of economic science."

Among the more prominent of the recent French writers of the classical school is Antoine Elisée Cherbuliez (1797-1869). Born in Geneva, he was there professor of law (1833), of political economy (1835), and then till 1848 on the *Grand Conseil*. Then going to France, he soon returned after the *coup d'état* and was instructor at Lausanne till, late in life, made professor in the Zurich Polytechnicum. His main writings are on political science and finance.

Better known, tho perhaps not more deserving, is Jean Gustave Courcelle-Seneuil (1813-92), merchant, journalist, and a professor of political economy at Santiago in Chile from 1854 to 1863. Cossa says of him: "He was made a *conseiller d'état* in 1879, and those of his writings which embrace philosophy, law, politics, and technical bookkeeping are of uneven merit, but his real strength appears in industrial and political economy, more especially in what he has to say on banking and on socialism. He was associated with Dussard in translating Mill's *Principles*, and published a treatise of his own largely in Mill's vein.

Courcelle-Seneuil.

This work deserves a large measure of commendation; its method is sound, the line between science and art is clearly and correctly drawn, the parallel between the competitive and the authoritative principles, as worked out in two schemes of economics, is accurately stated, it contains an instructive presentation of the positions relatively occupied, on the one hand by law and on the other by economic phenomena; and, finally, there are to be found in it considerations touching emigration and colonies based upon an almost unique Spanish-American experience."

Maurice Block, born in 1816, is the last name we notice of the strict classical school. Of German parentage, he is best known for his statistical works. He edited the *Dictionnaire Général de la Politique* (1862 ff.) and the *Dictionnaire de l'Administration Française* (1855 f.).

His *Compte Rendu* of economic literature, which he has written in the *Journal des Économistes* for over 40 years, has become famous. His main theoretical works are: *Le Progrès de la Science Économique depuis Adam Smith* (1890), in which he criticizes the historical and praises the Austrian school, and his *Les Théoriciens du Socialisme en Allemagne* (1873), *Le Socialisme Moderne* (1891), and *Le Quintessence du Socialisme de la Chaire* (1894), books against socialism, which Professor Ely calls "strong, but not altogether fair."

All of the above writers are of the strict classical school. We now come to a few who are of this school, but of some independence. Strongly individualistic, they would leave socialistic reform alone rather than oppose it. Cossa calls them "the optimists." The first of these was Charles Dunoyer (1786-1862), a daring journalist during the period of the Restoration; under Louis Philippe named *préfet* and *conseiller d'état*. Ingram says of him: "In no French economic writer is greater force or general solidity of thought to be found than in Charles Dunoyer (1786-1862), author of *La Liberté du Travail* (1845; the substance of the first volume had appeared under a different title in 1825),

Dunoyer.

honorably known for his integrity and independence under the régime of the Restoration. What makes him of special importance in the history of the science is his view of its philosophical constitution and method. With respect to method, he strikes the keynote at the very outset in the words *rechercher expérimentalement*, and in professing to build on *les données de l'observation et de l'expérience*. He shows a marked tendency to widen economics into a general science of society; expressly describing political economy as having for its province the whole order of things which results from the exercise and development of social forces."

Far better known, however, and more popular and brilliant, if not abler than Dunoyer, is Frédéric Bastiat (1801-50). He lived the most of his life in quiet possession of lands at Mugron, beginning his scientific career in 1844 and dying in Rome in 1850, it is said, of overwork.

Cossa says of him: "Bastiat was a sincere philanthropist, an eminent dialectician, and a formidable

champion of economic freedom, which he defended, to begin with against protectionist assaults, and after 1848 against the socialists. His part in these controversies is represented by many works, among which may be named *Capital et Rente* (1849) and *Gratuité du Crédit* (1850), written against both Proudhon and Crevé, who clamored for gratuitous credit. His *Sophismes Économiques* (1845 ff.) are masterly examples of good sense and logic. He applied a *reductio ad absurdum* to the great arguments of the protectionists—his famous defense of the petition of candle-makers is a good instance of his method—by showing how closely their ideas, which insist upon spoliation to benefit the rich, coincide with socialistic schemes of spoliation for the benefit of the poor, *Protectionnisme et Communisme* (1849). Little, if any, fault could indeed be found with his views, if they did not imply a return to the physiocratic doctrine of an inalienable and absolute right to free trade, and also to the physiocratic disallowance of economic functions to the State—to this Bastiat clearly commits himself in his book to the State (1849)—and if, further, he did not ignore entirely the plea for protection made on behalf of infant industries. His zeal for free trade led our author to translate Cobden's leading speeches along with those of Bright, Fox, and other leaders of the *Manchester Anti-Corn Law League*, prefixing a masterly preface of his own to the whole collection, *Cobden et la Ligue, l'Agitation Anglaise pour la Liberté des Échanges* 1845."

Ingram calls him a brilliant but not a profound writer, and says of his *Harmonies Économiques* (translated into English by P. J. Sterling (1860): "It will always be historically interesting as the last incarnation of thorough-going economic optimism. This optimism, recurring to its first origin, sets out from theological considerations, and Bastiat is commended by his English translator for treating political economy 'in connection with final causes.' The spirit of the work is to represent 'all principles, all motives, all springs of action, all interests, as cooperating toward a grand final result which humanity will never reach, but to which it will always increasingly tend, namely, the indefinite approximation of all classes toward a level, which steadily rises—in other words, the equalization of individuals in the general amelioration. . . ."

"His constant aim is, as he himself expressed it, to 'break the weapons' of antisocial reasoners 'in their hands,' and this preoccupation interferes with the single-minded effort toward the attainment of scientific truth. The creation or adoption of his theory of value was inspired by the wish to meet the socialistic criticism of property in land; for the exigencies of this controversy it was desirable to be able to show that nothing is ever paid for except personal effort. His view of rent was, therefore, so to speak, foreordained, tho it may have been suggested, as indeed the editor of his posthumous fragments admits, by the writings of Carey. He held, with the American writer, that rent is purely the reward of the pains and expenditure of the landlord or his predecessors in the process of converting the natural soil into a *farm* by clearing, draining, fencing, and the other species of permanent improvements. He thus gets rid of the (so-called) Ricardian doctrine, which was accepted by the socialists, and by them used for the purpose of assailing the institution of landed property, or, at least, of supporting a claim of compensation to the community for the appropriation of the land by the concession of the 'right to labor.'"

Bastiat exerted a widespread influence in France. Cossa mentions, among those most influenced by him, Martinelli, with his *Harmonies et Perturbations Sociales* (1853); Bénard, who wrote *Les Lois Économiques* (1862); and of living economists, Fontenay, *Du Revenu Foncier* (1854), who also in later works has shown great vigor in argument, and, finally, Frédéric Passy, the subtle and fascinating pleader for universal peace. See among other works, his *Leçons d'Économie Politique* (1861, 2 vols.), and his *Mélanges Économiques*.

Of much more independence and importance, altho of the same school, is Gustave de Molinari, born at Liège in 1819; editor of the *Économiste Belge* from 1855 to 1868, and since 1882 the *Journal des Économistes*. Cossa says of him: "Individualism has no more uncompromising defender than this multifarious writer, whose keen insight often deviates into whimsical extravagance, but never into dullness. Special questions, such as those of ownership, slavery, the corn trade, money, credit, and weights and measures, have engrossed him much; he has also taken up more general aspects of the whole complex mass of eco-

conomic facts, but whatever his theme may be, he always returns to the notion of the non-competence of the State, which he maintains by arguments considered extravagant even by those who, like Foville, are more sure to judge him leniently."

Another prominent French defender of individualism is Paul Leroy Beaulieu. An expert in statistics, he attracted attention first by a series of monographs on the moral and intellectual condition of laborers, on working women (1873), and on colonial systems (1874), all of which were crowned by the Academy of Moral and Political Sciences.

Cossa says of his views on State interference:

"He overstates the danger, but it is well to have it so, if only as an antidote to the equal extravagances of State socialism."

Two other moderns of this school must be mentioned: Henri Baudrillard, born in 1821. He was Chevalier's assistant professor in economics, and Levasseur's predecessor in the chair of economic history at the *Collège de France*, and his special subject of study was the relation between economic facts and moral laws. His more important works are *Manuel d'Economie Politique* (1857), *Histoire du Luxe Privé et Public* (1878-80), *Les Populations Agricoles de la France* (1880 ff.).

Émile Levasseur (1823) has written what Cossa considers meritorious works on economic history, and "the best book on the population of the century."

We now come to the French writers of the century who have more or less opposed the classical school. Augustin Cournot (1801-77), who was the very first to use the mathematical method in any competent fashion, in his *Recherches sur les Principes Mathématiques de la Théorie des Richesses* (1838). He abandoned, however, the mathematical method in his *Principes de la Théorie des Richesses* (1863); a work which Ingram says "is written with great ability and contains much forcible reasoning in opposition to the exaggerations of economic optimists."

Much better known is Jean Charles Léonard Simonde de Sismondi, born at Geneva in 1773, dying there in 1842. Cossa says of him: "Eminent in history and literature, he also was an expert in the science of agriculture, but maintained the conventional view on this subject in his first agricultural works, *Tableau de l'Agriculture Toscane* (1801), and *De la Richesse Commerciale* (1803). Later on he changed completely, and his *Nouveaux Principes d'Economie Politique, ou de la Richesse dans ses Rapports avec la Population* (1810), begins a consistent and severe attack upon views to which in his first works he was committed. He published quite in the same strain his *Études sur l'Economie Politique* at Paris in 1837 and 1838, and these two volumes discuss, from the new point of view, agriculture, slavery, manufactures, money, credit, colonies, and the balance between production and consumption. He attacks Adam Smith, Say, and Ricardo on many points; stigmatizing the science of their predilection as "chrematistics," because its chief concern is wealth, and it does not sufficiently make provision for man as the producer. Political economy, the real science which he opposed to theirs, must study the effect of production on the material comfort of the people, and this calls for the special attention of the State. Alarmed as he was by the rapid succession of crises in commerce, he proceeded to connect these with excessive production, and this resulted, according to his argument, partly from the division of labor, which in turn was the outcome of the introduction of machinery, and the organization of enterprise on a large scale; but the final root of the evil he discovered in competition, which had been allowed to run riot, with the result that rich men were always growing richer, and poor men poorer. On the strength of this argument Sismondi proclaimed the instant and imperative necessity of a return to small agricultural holdings and farming on a small scale, as well as of a revival of petty industries. Furthermore, he maintains stoutly that the employer must guarantee a livelihood to the workman, who is also entitled to have recourse to the State." Sismondi is thus an inconsistent socialist. He would not change the present system of distribution, to do which he thinks would be mischievous; he sharply criticizes modern industrialism, although unable, as he admits, to suggest a better system. Hence people have made out of his writings what they would. Theodor Fix, who founded the *Revue Mensuelle d'Economie Politique* (Paris, 1833-36), and wrote in 1846 his *Observations sur l'État des Classes Ouvrières*; S. R. Villermé, who has *Tableau de l'État Physique et Moral des Ouvriers* (1840), and Léon Foucher with his *Études sur l'Angle-*

terre (1845) Cossa considers to have been under Sismondi's influence at his best, while Eugène Buret's *La Misère des Classes Laborieuses en Angleterre et en France* (1842); Villiamé's *Nouveau Traité d'Economie Politique* (1857), and Auguste Ott's *L'Economie Politique Coordonnée au Point de Vue du Progrès* (1891), represent Sismondi's less desirable influence.

This is not the place to consider the French socialists and social philosophers (see articles SOCIALISM; FOURIER; ST. SIMON; LAMENNAIS; CABET; PROUDHON; LOUIS BLANC; COMTE, etc.), but the school of Le Play must be considered on account of its influence on French economic studies. F. Le Play (1806-72), deeply interested in social reform, became convinced that there were no economic principles satisfactorily established in France, because no one had sufficiently collected facts. Without adhering therefore to either socialistic or individualistic views, he devoted his life to the careful investigation of facts, and the setting of other people to collect facts. A prominent part in this work was taken by the two reviews he established, *La Réforme Sociale* (1881 ff.) and *La Science Sociale* (1886). He also established the *Société d'Economie Sociale*, and a whole movement has developed from it. He strongly emphasizes the integrity of the family, and opposes the equal distribution of land among coheirs as tending to disintegration. This is the theoretical *magnum opus* of the school, and has been summarized in a volume entitled *L'Organisation du Travail*, 1870. Among Le Play's chief followers Cossa mentions Delaire, Faucillon, Ribbe, Guérin, and last but not least Émile Cheysson, a professor at the *École des Mines* and at the *École des Sciences Politiques*, the organizer of the section of social economics at the International Exhibition in 1889, and the writer of many monographs, both statistical and economic.

Le Play was a Catholic, but made only final appeal to the Gospel and the Decalogue so as to try and reach Christians of all churches. His ideas, however, have been taken up by a strong Catholic movement. Cossa says:

"This school is at home chiefly in Belgium, and more especially at the Louvain University, which is backed by the clergy, who use it against the free university at Brussels and the governmental ones of Liège and Ghent. It has now representatives also in the free law faculties of Paris, Lyons, Lille, and Angers."

A Frenchman, Charles Périn, has borne the brunt of battle for these views in his *De la Richesse dans les Sociétés Chrétiennes, Les Lois de la Société Chrétienne* (1875), *Le Socialisme Chrétien* (1878), *L'Economie Politique d'Après l'Encyclopédie* (1891), *Les Doctrines Économiques Depuis un Siècle* (1880).

Victor Brants is the successor of Périn in his professorship, possessing, Cossa says, "equal native gifts, but a far superior acquaintance with historical facts, and a much more definite familiarity with the technical points involved in various theories." He began with a learned *Essai Historique sur la Condition des Classes Rurales en Belgique* (Louvain, 1880), and this is connected with a very valuable investigation by Vanderkindere. When raised to his professorship, Brants summed up in three volumes all the doctrines of the Catholic school in economics. These are: *Lois et Méthodes de l'Economie Politique* (Louvain, 1883; second edition, 1887), *La Lutte pour le Pain Quotidien* (1885), *La Circulation des Hommes et des Choses* (1886).

Paul Jannet, a retired magistrate and now professor at the *Institut Catholique* in Paris, is of the same school of thought. His *Les États-Unis Contemporains* (fourth edition, 1889; 2 vols.), Cossa call indispensable to understanding the present condition of the United States. His *Socialisme d'État et la Réforme Sociale* (1890) is directed against State socialism.

Of the other group of French Catholic Christian Socialists, led by the fiery orator, le Comte de Mun, we do not here speak, since it is political rather than economic.

Protestant Christian Socialism, in France, however, has an active society for economic studies, and has as an active worker in it one economist, Charles Gide (brother of the late Paul Gide), whom Cossa calls "unquestionably the most promising economist of his years in France." Cossa goes on to say: "He goes against optimism, is in favor of freedom, though no blind devotee of competition. Let him but measure a little the expressions which he uses about land tenure; let him but

Le Play.

Sismondi.

Gide.

bring back to earth certain winged words of prediction touching the future of distributive cooperation, which is to usher in cooperative production, and then he will find himself far nearer the company of the classical school than he would readily believe, if some rather ill-defined censures of his upon that school are to be insisted upon. Reasons enough for saying this can be found in his text-book of political economy, which, in the present writer's opinion, is the very best now published in France, just as Cherbuliez' book is the best treatise. . . .

Gide's main works are: *Principes d'Économie Politique* (Paris, 1884; third edition, 1891. Translated into English, 1891), *L'École Nouvelle* (Geneva, 1890), and his contributions to the *Revue d'Économie Politique* (Paris, from 1887 on).

Concerning writers in special departments, Cossa says: "Adolphe Quételet (1798-1874) created the modern study of statistics. Guerry was past master in dealing with ethical statistics, where Yvernès has also shown consummate ability; Bertillon gave his splendid powers to demography, which Levasseur has chosen for his special subject; Moreau de Jonnés, Legoyt in the past, and now Alfred de Foville, not to mention again the eminence of Block, have also distinguished themselves in economics. Foville's brilliant articles on prices are well known, and so are his two admirable monographs, one on transportation,—*Les Transformations des Moyens de Transport* (1880),—and the other on the extreme subdivision of land holdings—*Le Morcellement* (1885). This last should be read in connection with A. Legoyt's book (1886). Then there is Franqueville's *Du Régime des Travaux Publics* (second edition, 1876; 4 vols.); l'Audiganne's *Les Chemins de Fer* (1858-63; 2 vols.); Picard's *Traité des Chemins de Fer* (1887; 4 vols.); all of which seek to throw light upon the history as well as the technical management of public works, and more especially of railways.

"Upon agricultural economics there are many writers besides Baudrillart, who died in 1892. There was Hippolyte Passy (1793-1880), whose book, *Systèmes de Culture* (second edition, 1852), has yet to be equalled. There was Léonce de Lavergne (1860-80), whom Cliffe Leslie praised so warmly and so justly in the *Fortnightly Review* of February, 1881, and to whom we owe various learned and most readable monographs: *Essai sur l'Économie Rurale de l'Angleterre, de l'Écosse et de l'Irlande* (1854); *L'Agriculture et la Population* (1857; new edition, 1865); *Économie Rurale de la France* (1860; third edition, 1866). Finally, there are the Belgian Piret, whose work, though ill-planned and proportioned, has great weight—*Traité d'Économie Rurale* (1880 ff.); M. le Comte de Tourdonnet, with his *Traité Pratique du Métaillage* (1882), and Rerolle, who wrote *Du Colonoage Partiaire* (1888)—all of whom have deeply studied the metayer system; and there are many writers, too, who have written on credit as applied to farming and land holding, as well as Cazeneuve (1889), who devoted his attention to profit-sharing in rural enterprises.

"On manufactures, praiseworthy work was done by Léon Faucher, Ducpétiaux of Belgium, and Charles Laboulaye, a brother of the famous Édouard; on credit and banking there have also been excellent works by Wolowski, Horn, Juglar, and Courtois, fils." Cossa mentions Amé's free-trade *Étude sur les Tarifs des Douanes* (1870); Naville's (1784-1830) *La Charité Légale, ses Causes and ses Effets*. Among works on finance he selects, besides Leroy Beaulieu's *Traité* and Léon Say's *Dictionnaire*, Parieu's *Traité des Impôts* (1862-64).

Political economy, as a pure science, Cossa believes to have been on the whole little developed in France, a fact which he considers due to three causes. "To begin with," he says, "instruction in economics has been difficult to obtain in France; only here and there were there special schools, like the Conservatoire des Arts et Métiers, the École des Ponts et Chaussées, and lately the new foundation of the École des hautes Études Commerciales and that of the École Libre des Sciences Politiques have made a special point of teaching political economy. In the Collège de France, where no academic degrees are conferred, and where there are

no regular hearers, our science has been pursued among other works of supererogation; but, nevertheless, just there men of the greatest eminence, such as Say, Rossi, Chevalier, and Baudrillart have taught, and there Levasseur and Leroy-Beaulieu may be heard to-day. Not until after 1878 was economics placed by the faculty of law on the list of subjects for regular in-

struction, at first optional and then obligatory, here as well as in the schools above alluded to. . . .

"Again, the progress and diffusion of economic knowledge in France was most seriously interfered with by constant onslaughts made upon it on behalf of industrial protectionists, vigorously backed by the mass of public opinion, by those in the uppermost ranks of the governmental hierarchy, by the ruling majorities of deliberative assemblies, and by a swarm of writers, not a few of them men of a vigorous mind. . . .

"But, after all is said and done, the leading and most real cause of the decline of economic study in France is singled out in words of eloquent regret in Léon Say's *Le Socialisme d'État* (1884; see p. 209); it is the invasion of socialistic doctrines which have found ready acquiescence among the working people, the ground having been prepared by persistent usurpations on the part of the French bureaucracy. Nor is the case improved at all, but rather it is complicated, by the uncompromising optimism of the official school, with its individualism that knows no limits; the upshot being that erroneous theories are the only arm available against the wild practical schemes of socialism, which is thus practically left in possession of the public ear.

"The exclusiveness of this school asserts itself by means of Molinari's *Journal des Économistes* (1842); Leroy-Beaulieu's *Économiste Français* (1873); and Beaugregard's *Monde Économique* (1891). It also makes no sparing use of the large funds belonging to the Académie des Sciences Morales et Politiques, shaping economic thought directly by the subjects assigned for competitive prize essays, and indirectly by the somewhat one-sided views which govern final awards, so that the very solutions looked for in advance are evoked. Advantage is also taken of the monthly meeting of the Société d'Économie Politique, and of the publications from the press of Guillaumin, which makes a speciality of books on economics."

Thus rather mournfully, even while praising certain economists, Cossa sums up the general situation. As we have seen, the *Revue d'Économie Politique* represents the progressive school, and *La Réforme Sociale*, the Le Play movement.

J. GERMANY.

The characteristic development of modern German economics is the historical school, but we commence with a notice of the German economists of the classical school, which after the disappearance of the mercantilists and physiocrats (see sections D and F) was for a while influential in Germany.

The first of these were contemporary with Adam Smith. The position of that author had profoundly influenced the statesmen Stein and Hardenberg, and led to the legislation which abolished many of the old feudal restraints and guild-monopolies, etc.; doing to an extent, in a legal way, the negative work accomplished in France by the Revolution. In connection with this movement several names must be mentioned in Germany. Sartorius, in 1796, published a *Handbuch* and *Von den Elementen des Nationalvölkchthums* (1806-08). Christian Jakob Kraus published a *Staatswirthschaft* (1808-11), and August Ferdinand Lüder, *Ueber National Industrie* (1800-04), and *Nationalökonomie* (1820). Of others of this period, Cossa says:

"With a larger measure of originality, Count Julius Soden applied himself to a more exact formulation of the fundamental notions of our science; see his *Nationalökonomie* (Leipzig, 1805-24, 9 vols.), a book disfigured by the obscurity of a style which is wearisomely prolix, and by the author's keen relish for elaborating purely verbal disputes. G. Hufeland, on the other hand, shows real insight in his *Neue Grundlegung der Staatswirthschaftskunst* (Giessen, 1807-13), where he gives a full account of the functions of the *entrepreneur*, and develops the conceptions of value, price, capital, and money. A still greater master of clearness than Hufeland was Johann Friedrich Eusebius Lotz, as he showed not only in his *Revisions der Grundbegriffe der Nationalwissenschaftlehre* (Coburg, 1817-14), but also in an admirable *Manual*, where he favors free trade, and in his slightly diffuse exposition of finance (*Handbuch der Staatswirthschaftslehre*, Erlangen, 1821 ff., 3 vols.; second edition, 1837 f.). But there was another and shorter compendium of general principles, *Grundsätze der Nationalökonomie* (Halle, 1805; third edition, 1825), by Ludwig

Heinrich von Jakob, which was far more widely adopted in schools. Its author also translated Say, and wrote a correspondingly serviceable manual of finance, *Die Staatsfinanzwissenschaft* (Halle, 1821)."

Coming to more prominent names, the first is Karl Heinrich Rau (1792-1870), a professor at Erlangen in 1818. He was transferred to Heidelberg in 1822, where he continued 48 years. His *Lehrbuch der Politischen Oekonomie* (vol. i., 1826) was long the chief text-book in Germany, and passed through many editions. Cohn says "his *Lehrbuch* accomplished all that could possibly be attained by combining the cameralistic traditions with the system and spirit of Adam Smith.

... At the same time the book, written, as was customary then, with a view to practical use in the management of State affairs ('with constant reference to the existing public institutions'), fulfilled its purpose all the better because the author himself had participated in the public administration, and given it the benefit of his well-ordered counsels."

C. A. Malchus (1770-1846), at one time minister of the King of Westphalia, cultivated finance and dealt with it in a *Handbuch des Finanzwissenschaft* (1830). Johann Gottfried Hoffman (1765-1847), a professor and director of the Berlin statistical office, wrote several books on money, particularly *Die Lehre vom Gelde* (1838), and *Die Zeichen der Zeit in Deutschen Münzweisen* (1841), the first German argument for a gold monometallism. Karl Friedrich Nebenius, Cossa considers superior to both Rau and Hoffman. His career runs from 1784 to 1857. He was prominent as a promoter of the Zollverein; but his books of greatest value are *Der öffentliche Credit*, 1820; *Ueber die Herabsetzung der Zinsen der öffentlichen Schulden*, 1835.

Johann Heinrich, Graf von Thünen (1780-1850), is a writer whom it is hard to place. Some have called him an individualist, and some a socialist. He arrived by the deductive method at the Ricardian law of rent and especially developed the influence of situation upon land rent. His *Der isolirte Staat* is in a still broader view. Cohn says that this book has survived and will long survive. Purchasing in 1810 an estate in Mecklenburg, he made an attempt at agricultural profit sharing. Friedrich Benedikt Wilhelm von Hermann (1795-1868) is less original but more scholarly. He was first professor and then director of the Munich statistical office. His *Staatswirthschaftliche Untersuchungen* was published in 1832.

Hans von Mangoldt (1824-68) was professor at Göttingen, and then at Frieburg in Breisgau. In important works, *Die Lehre vom Unternehmervogewinn* (1885), *Grundriss der Volkswirtschaftslehre* (1869), *Volkswirtschaftslehre*, 1st Band (1868), he analyzes the entrepreneur's profits as distinct from interest and wages, and identifies land rents with monopoly profits. Lorenz Stein (1815-90) was a professor at Vienna, and a thorough student of French socialism.

He is a creator in the science of administration, and favored radical reforms in the teaching of law. He wrote a *Lehrbuch der Nationalökonomie* (1858) and a *Lehrbuch der Finanzwissenschaft* (1860).

Stein.

Of a few other men of this school Cossa says: "There is a group of specialists who either diverged so little from the classical school, or were so preoccupied with the vigorous prosecution of special investigations, that they held aloof from the controversy which raged between the historical school and the optimists. These distinguished specialists are Baumstark, Laspeyres, and Hefelrich, who wrote on variations in the price of gold and silver from 1492 to 1830 (Nürnberg, 1843); E. Nasse, who produced admirable monographs on money, credit, and banks among other topics; and last, but first in the order of merit, the eminent Georg Hansen, in whose debt we are for a series of invaluable works discussing more particularly the historical aspects of German rural economy."

We now come to the great school of Germany, the historical school. The rudiments of this school may be found in various writers, Adam Müller, Alexander Hamilton, Sismondi, Schön, in his *Neue Untersuchung der Nationalökonomie* (1835), Schmittner in his *Zwölf Bücher von Staats* (1830), but perhaps particularly in Auguste Comte. Europe, after the French Revolution, was in an unrest. Men were leaving the old, but not seeing the new. There was need, Ingram says, "of a scientific social doctrine which should supply a basis for the gradual convergence of opinion on human questions. The foundation of such a doctrine is the immortal service for which the world is indebted to Auguste Comte.

"The leading features of sociology, as he conceived it, are the following: (1) it is essentially *one* science, in which all the elements of a social state are studied in their relations and mutual actions; (2) it includes a dynamical as well as a static theory of society; (3) it thus eliminates the absolute, substituting for an imagined fixity the conception of ordered change; (4) its principal method, though others are not excluded, is that of historical comparison; (5) it is pervaded by moral ideas, by notions of social duty, as opposed to the individual rights which were derived as corollaries from the *ius nature*; and (6) in its spirit and practical consequences it tends to the realization of all the great ends which compose 'the popular cause'; yet (7) it aims at this through peaceful means, replacing revolution by evolution."

The first Germans, however, to oppose the classical school were Adam Müller (1779-1826) and Friedrich List (1780-1846). Ingram says Müller was a man of real genius, and his *Elemente der Staatskunst* an important book. List was the initiator of the later German protectionism, and is especially regarded in South Germany. He favored a *national* rather than a universal economic development, and actively fought for the development of the Zollverein, railroads, and all that could aid German unity. His *Das Nationale System der Politische Oekonomie* (1841) really marks an epoch in the development of German thought.

Others of the same general transitional school, according to Cohn, were Friedrich Gentz, a friend of Adam Müller; Karl Ludwig von Haller, a patrician of Berne; Alexander von der Warwitz; Theodor Bernhardt, "a penetrating critic" of the classical theories; Georg Hansen, a man, says Cohn, "whose influence began, beyond question, to make itself felt in the second third of the century, while his scientific position was, for a long time after that, a monumental example for those who would reform German political economy by means of historical investigation."

We now come to the three great leaders of the historical school, Roscher, Knie, and Hildebrand. Of the first Ingram says:

"Omitting preparatory indications and undeveloped germs of doctrine, we must trace the origin of the school to Wilhelm Roscher. Its fundamental principles are stated, tho with some hesitation, and with an unfortunate contrast of the historical with the 'philosophical' method, in his *Grundriss zu Vorlesungen über die Staatswirthschaft nach geschichtlicher Methode* (1843). The following are the leading heads insisted on in the preface to that work.

"The historical method exhibits itself not merely in the external form of a treatment of phenomena according to their chronological succession, but in the following fundamental ideas: 1. The aim is to represent what nations have thought, willed, and discovered in the economic field; what they have striven after and attained, and why they have attained it. 2. A people is not merely the mass of individuals now living; it will not suffice to observe contemporary facts. 3. All the peoples of whom we can learn anything must be studied and compared from the economic point of view, especially the ancient peoples, whose development lies before us in its totality. 4. We must not simply praise or blame economic institutions; but few of them have been salutary or detrimental to all peoples and at all stages of culture; rather, it is a principal task of science to show how and why, out of what was once reasonable and beneficent, the unwise and inexpedient has often gradually arisen."

Roscher, in his long life as a teacher (he was born 1817, and professor at Göttingen 1843, and at Leipzig after 1848), has written numerous works. Among his best, *System der Volkswirtschaft* (first volume, 1854; fourth volume, 1885); *Ansichten der Volkswirtschaft* (1861); *Ueber Kortheuerung und Theuerungspolitik, Kalomen, Kolonialpolitik und Auswanderung* (1856); *System der Finanzwissenschaft* (1886). Cossa calls him "one of the most illustrious economists of this century." Cohn considers him "of the foremost rank."

Roscher.

Karl Knie, professor at Heidelberg, was born in 1821. Altho his style is poor, Cossa calls his knowledge of economics and law phenomenal. Ingram considers his *Die Politische Oekonomie von Standpunkte der geschichtlichen Methode* "an elaborate exposition and defense of the historical method in its application to economic science, and the most systematic and complete manifesto of the new school, at least on the

The Historical School.

logical." Cohn says of it: "A generation has elapsed, in which the reputation and influence of this book has steadily increased. The new and enlarged edition which came out in 1883 would, it is true, have been received with more favor in scientific circles if the material which had been omitted from the first edition had now been introduced; or, on the other hand, if the work had been transformed into a true method of political economy. But be that as it may, Knies' book, from the time of its publication to the present day, has been better fitted than any other to settle the question of what is really meant when one talks of an historical method of political economy."

Knies. Bruno Hildebrand (1812-78), the third of the trio, and perhaps second in chronological order, was professor at Jena in 1863 and founded there the *Jahrbücher für Nationalökonomie und Statistik*. In 1873 he associated his son-in-law, Professor Johann Conrad, with the more and more arduous work of editorship, which finally passed entirely into his hands in 1878.

Ingram says of Hildebrand, that he was "a thinker of a really high order; it may be doubted whether amongst German economists there has been any endowed with a more profound and searching intellect. He is quite free from the wordiness and obscurity which too often characterize German writers, and traces broad outlines with a sure and powerful hand. His book contains a masterly criticism of the economic systems which preceded or belonged to his time, including those of Smith, Müller, List, and the socialists. But it is interesting to us at present mainly from the general position he takes up, and his conception of the real nature of political economy."

His *Die Nationalökonomie der Gegenwart und Zukunft*, the first volume of which appeared in 1863 and was never continued, was one of the earliest utterances of the historical school.

These three men, Roscher, Knies, and Hildebrand, are usually considered the founders of the historical school, but Cohn associates with them Lorenz Stein, whom we have noticed above. For four decades he stood a master in the entire realm of legal and political sciences. His chief work is his *Verwaltungslehre* (begun in 1868). Cohn says of him:

"He has combined the old theory of political economy with the broader conceptions of a 'science of society'; he has elevated the cameralistic science of finance and police to their proper places in a higher system of knowledge, by showing their close connection with law and State. Planned with such bold strokes, his work shows not so much an elaboration of detail as a laying out of boundaries and divisions of the whole. It is not so much the completion of the work as the rich and thoughtful suggestion which is notable. It is characteristic of Stein that he retains the individual theories of political economy comparatively unchanged, and does not follow the course pointed out by the historical school and by Knies in particular; other men, however, have long since made the deductions which render these theories plastic."

"It was these four men," says Cohn, "Stein, Roscher, Hildebrand, and Knies, who in the period of 1842-53 prepared the way for the German political economy of to-day. They are the ones most worthy of our attention in this connection."

But they are not necessarily the greatest names of the school, altho its founders. Cossa says that after justifying the historical method they neglected to carry it out, but left it to a younger man, Gustav Schmoller, born in 1838, and now professor at Berlin.

Schmoller. He has written numerous works on the details of small industries, corporations, epochs in Prussian finance, with other points in the history of German economics, and is now publishing valuable studies in the theory of industrial enterprise. Many of these he published in his *Jahrbuch für Gesetzgebung, Verwaltung und Volkswirtschaft*, founded in 1872 by Holtzendorf, and which Schmoller has edited since 1881. Important, too, are the *Staatswissenschaftliche Forschungen*, published since 1878 by Schmoller's best pupils. It was Schmoller who, perhaps more than any other, was the leader in the interesting movement that became manifest in 1872 and led to the formation of a society called the "Verein für Socialpolitik," largely favorable to a mild paternal State socialism.

Says Ingram of this school: "The members of the school of which we are now speaking, when intervening in the discussion of practical questions, have occupied an intermediate standpoint. They are opposed alike to social revolution and to rigid *laissez-faire*. While rejecting the socialistic program, they call for the intervention of the State, in accordance with the theoretic principles already mentioned, for the purpose of mitigating the pressure of the modern industrial system on its weaker members, and extending in greater measure to the working classes the benefits of advancing civilization. Schäffle in his *Capitalismus und Socialismus* (1870; now absorbed into a larger work), Wagner in his *Rede über die Sociale Frage* (1871), and Schönberg in his *Arbeitsämter: eine Aufgabe des Deutschen Reichs* (1871), advocated this policy in relation to the question of the laborer. These expressions of opinion, with which most of the German professors of political economy sympathized, were violently assailed by the organs of the free-trade party, who found in them 'a new form of socialism.' Out of this arose a lively controversy, and the necessity of a closer union and a practical political organization being felt among the partisans of the new direction, a congress was held at Eisenach in October, 1872, for the consideration of 'the social question.' It was attended by almost all the professors of economic science in the German universities, by representatives of the several political parties, by leaders of the working men, and by some of the large capitalists. At this meeting the principles above explained were formulated. Those who adopted them obtained from their opponents the appellation of 'Katheder-Socialisten,' or 'socialists of the (professorial) chair,' a nickname invented by H. B. Oppenheim, and which those to whom it was applied were not unwilling to accept. Since 1873 this group has been united in the 'Verein für Socialpolitik,' in which, as the controversy became mitigated, free-traders also have taken part. Within the Verein a division has shown itself. The left wing has favored a systematic gradual modification of the law of property in such a direction as would tend to the fulfillment of the socialistic aspirations, so far as these are legitimate, while the majority advocate reform through State action on the basis of existing juristic institutions."

Among the members of this school, willing in some respects to go to the most radical extremes, a high place must be assigned to Adolph Wagner. He has pursued his professorial career at Vienna, Hamburg, Dorpat, Frieberg, and for over 20 years at Berlin. Cossa calls him a specialist of the first rank on money, banks, and finance. With Arendt, Schäffle, and others he has strongly defended international bimetallism. In his *Die Abschaffung des Privateigentums* (1876) he defended property in land against attacks from the socialists, but by advising the governments of large towns to resort to the expropriation of houses as the only possible measure against extortionate house rents, he invited vehement censure, which he duly received from Roscher and Nasse.

Cohn says of Wagner (*History of Political Economy*, translated by J. A. Hill, p. 120): "Wagner began his career as an economist by publishing monographs on credit and moral statistics, which at once attracted attention. He then went on to take up a work of greater scope, viz.: the revision and elaboration of Rau's text-book of political economy. But the task thus begun developed under his hands, until he was led to undertake a large and independent work of his own. He proposed, that is, to publish a text-book of political economy which should thoroughly discuss legal institutions with a view of providing, as a substitute for the doctrine of the natural rights of the individual, a positive answer to the criticisms of the socialists. The completion of this proposed work—the largest by far that has yet been undertaken in political economy—is not to be expected in the immediate future. The following volumes have appeared: *Grundlegung zur Volkswirtschaftslehre* (Fundamental Principles of Political Economy, 1875); *Finanzwissenschaft* (Science of Finance, pt. i. 1871-72; pt. ii. 1880; pt. iii. 1880)."

Wagner has also to some extent identified his name with German Protestant Christian Socialism. (See CHRISTIAN SOCIALISM.)

Not far removed from the position of Wagner is that of Gustav Cohn, whom we have quoted: "Gustav Cohn began his professoriate at Riga, continued it first at Tübingen and then at Zürich; whence he was called to his present post at Göttingen. His

**Katheder
Socialisten.**

Wagner.

maiden effort was on English railway legislation; his brilliant essays in the field of economic history and political economy next called attention to his very varied powers. A later work from his pen is his *System der Nationalökonomie* in two volumes; the third chapter of the first book of which it is that has been translated by Dr. J. A. Hill, as *A History of Political Economy*. Professor James says of Cohn in an introduction to the above translation: "Professor Cohn's work is so well known in Europe and America that it would be superfluous for any one else to vouch for its scientific character. He has, himself, been one of the most prominent contributors to recent economic science in Germany, and, in addition to writing many valuable monographs, he has been one of the few who have succeeded in making a systematic treatise on economics and finance, which is at once scientific and readable."

Cohn.

Others of the historical school are Lujo Brentano, Adolf Held, Erwin Nasse, H. von Scheel, Gustav Schönberg, Adolph Samter.

Pehäns the writer among the German economists most favorable to democratic socialism is Albrecht Eberhardt Friedrich Schäffle. His professoriate, begun at Tübingen in 1861, was continued at Vienna in 1868, he having in the meantime been from 1862 to 1865 a member of the Württemberg Landtag, and having sat in 1868 in the *Zollparlament*. In 1870 he became Minister of Commerce in the Hohenwart Cabinet, with which he fell in 1871. He now lives at Stuttgart, and edits the quarterly *Zeitschrift für die gesammte Staatswissenschaft*, founded in 1844 by the Tübingen professors, who edited it until 1875. Schäffle made his beginning with a good compendium of political economy, which grew bulkier and more valuable through successive editions. There he shows complete grasp of the theory of business enterprise, deals competently with money, credit, and means of transportation, and dwells effectively upon the distinction between economics at large and its special branches. Ingram says Schäffle goes so far as to maintain that the present "capitalistic" régime will be replaced by a socialistic organization; but, like J. S. Mill, he adjourns this change to a more or less remote future, and expects it as the result of a natural development, or process of "social selection"; he repudiates any immediate or violent revolution, and rejects any system of life which would set up "abstract equality" against the claims of individual service and merit.

The further the investigations of the German historical school have been carried, in the several lines of inquiry it has opened, the more clearly it has come to light that the one thing needful is not merely a reform of political economy, but its fusion in a complete science of society. This is the view long since insisted on by Auguste Comte; and its justness is daily becoming more apparent. The best economists of Germany now tend strongly in this direction. Schäffle, who is largely under the influence of Comte

Schäffle.

and Herbert Spencer, has actually attempted the enterprise of widening economic into social studies. In his most important work, which had been prepared for by previous publications, *Bau und Leben des sozialen Körpers* (1875-78; new edition, 1881), he proposes to give a comprehensive plan of an anatomy, physiology, and psychology of human society. He considers social processes as analogous to those of organic bodies; and, sound and suggestive as the idea of this analogy, already used by Comte, undoubtedly is, he carries it, perhaps, to an undue degree of detail and elaboration.

Schäffle's direct study of socialism, embodied in his *Die Quintessenz des Socialismus* (1875), is so favorable to socialism that he is often called a socialist, and to answer this charge he wrote his *Die Aussichtslos der Sozial Demokratie* (1885, the Impossibility of Social Democracy), but Cossa says that this book does little to disabuse the reader of the charge that Schäffle is a socialist.

Not all modern German economists, however, lean toward socialism. There is a band of liberal economists who, under the lead of Prince-Smith (1809-74), have organized at Berlin an economic society and have held congresses. It founded in 1863 the quarterly *Vierteljahrsschrift für Volkswirtschaft und Culturgeschichte*.

Of other German general economic periodicals, Cohn gives the following succinct account: "For a long time there was but a single journal of political economy. It was small in size and hardly regular in its publication. Then this solitary periodical was

combined with a journal of general political science, so that for a decade there was no journal whatever devoted exclusively to economics. Such in brief was the career of the *Archiv der Politischen Oekonomie und Polizeiwissenschaft* (Archive of Political Economy and of the Science of Police). It was founded by Rau in 1835. After 1843, it was continued as a "new series," with Georg Hansen as assistant editor. But in 1853 it was combined with the *Zeitschrift für die gesammte Staatswissenschaft* (Journal of General Political Science), a publication which the Political Science Faculty of the University of Tübingen had founded in 1844.

It was not until 1863 that a second independent journal of political economy appeared; the *Jahrbücher für Nationalökonomie und Statistik* (Annals of Political Economy and Statistics), edited by Bruno Hildebrand. It was significant of the changes which time had wrought, even in practical political economy, that contemporaneously with this journal, the *Vierteljahrsschrift für Volkswirtschaft* (Quarterly Journal of Political Economy) was started. It was published by Julius Faucher and Otto

Reviews.

Michaelis, as the organ of the German free-trade party. Hildebrand's *Jahrbücher*, on the other hand, confined itself to purely scientific ends, giving expression to this purpose partly by the purely historical character of its articles. . . . In 1872 Johannes Conrad became associate editor, and in 1878 assumed full charge of the work. At this time the tendency toward political economy in the Tübingen *Zeitschrift für die gesammte Staatswissenschaft* was becoming more and more pronounced, under the controlling influence of Albert Schäffle (and later, after 1878, of Adolph Wagner). Then with the founding of the German Empire the *Jahrbuch für Gesetzgebung, Verwaltung und Rechtspflege des deutschen Reichs* (Annals of Legislation, Administration, and Judicature in the German Empire) came into existence, edited by Fr. von Holtzendorff. After a short time, in 1887, the word *Rechtspflege*, Judicature, in its title was replaced by *Volkswirtschaft*, Political Economy. A little later this periodical came into the hands of that competent editor, Gustav Schmoller (1881), and entered upon a remarkably prosperous career. Closely related to the original intentions of the *Jahrbuch*, with its subjects and treatment, is the *Annalen des Norddeutschen Bundes und des Deutschen Zollvereins* (Annals of the North German Federation and the German Customs-Union). It first appeared in 1868, and in 1870 was changed to *Annalen des Deutschen Reichs für Gesetzgebung, Verwaltung und Statistik* (Annals of the German Empire; a Periodical Devoted to Legislation, Administration, and Statistics). It is edited by Georg Hirth, and contains a valuable collection of materials, as well as a series of critical, and partly also general, more academic contributions.

At the same time a number of statistical journals have sprung up in connection with the more important statistical bureaus of the German states. Especially noteworthy is the one edited by that highly gifted and energetic man, Ernst Engel, the *Zeitschrift des kgl. Preussischen Statistischen Bureau*s (Journal of the Royal Statistical Bureau of Prussia), established in 1861.

K. AUSTRIA.

The Austrian school of economics has gained at the present time a deserved prominence. Its earlier days were of small importance.

Cossa mentions von Czörnig and Ficker, Neumann-Spallart, Brachelli, the Bavarian K. Th. von Inama-Sternberg, the historian of German economics, Professor Mischler of Prague, Beer, Plener, Peez, Neunrath, Hertzka (q. v.), Kudler, Karl von Hock; but the three great names in Austria are Sax, Menger, and Böhm-Bawerk. Says Cossa: "Emil Sax was born in 1845, became professor at the German University of Prague, was elected a member of the Reichsrath, and has written a sound book on working men's houses, but his great celebrity as an economist was achieved by his masterly special account—Schönberg's *Manual* summarizes it—of the means of transportation.

Sax.

With no unsteady hand he pointed out the public nature of all such arrangements, proceeding by way of the most impartial and clear-headed analysis. These merits put his work on a footing far superior to that of such books as Cohn's and Wagner's, which show many marks of personal bias. Sax has held his own in discussions of method,

defending the conclusiveness of deductive reasoning; he has subjected the influence of the higgling of the market, as well as that of such moral influences as modify it, to a searching scrutiny, and thus has thrown light upon both; he has also set forth even in the domain of pure science the inevitable necessity of State intervention. Equally remarkable is the originality of our author in the book where he seeks to base the whole of finance upon deductive reasoning, and to give it a place in pure science; and he has followed the same argument in dealing with value. But in respect of this last point he certainly is guilty of serious overstatements, and resorts to a form of presentation which is anything but clear.

"A still more remarkable influence is that of Carl Menger, born in 1840, a professor at Vienna. His very first production received very high praise, though hardly so much as it deserved. Then came essays on capital and money in which, though ignorant of what Jevons had done, and without any recourse to the calculus, he reached conclusions which were either parallel to those of Jevons or altogether original on the subject of the relative and purely personal measure of value for goods instrumental, substitutive, and complementary. He also made applications quite peculiarly his own, which formed the basis for a series of writings by his pupils, von Wieser, now a professor at Prague, Zückerkandl, and Komorzynski."

Menger's distinguishing characteristic, however, is his criticism, first made in his *Untersuchungen*, on the tendencies of the historical school. Menger does not despise history. He has done much to encourage its study. But he criticizes the historical school as being too purely inductive, and as not giving sufficient emphasis to the physiologic side of economics, especially as regards value. His special work has been to consider right method in economic science; the full title of his chief book is *Untersuchungen über die Methode der Socialwissenschaften und der Politischen Oekonomie insbesondere* (Leipzig, 1883).

Of Böhm-Bawerk Cossa says: "Among all Menger's pupils, however, Eugen von Böhm-Bawerk, professor first at Innsbruck and now at Vienna, is undoubtedly the leader. He began with a remarkable monograph, proving that established ownership, whether *de jure* or *de facto*, tho it doubtless plays an important part in constituting individual capital, cannot properly be viewed by political economy as social capital. Far more clear, tho far more brief than Wieser's, is our author's development of the theory of value, based tho both accounts are upon the conception of the margin of utility established by Menger. But now we come to Böhm-Bawerk's greatest work, which is incontrovertibly his history and theory of interest upon capital, which receives at his hands an explanation hinging upon the difference in value between present and future products; no matter whether the products in question are destined for consumption as such, or swallowed up in the course of production. This is a book of profound research, acute criticism, and extreme lucidity."

For his views, see BÖHM-BAWERK.

Among other pupils of Menger Cossa mentions Gross, Mataja (Böhm-Bawerk's successor at Innsbruck), Meyer, Philippovitch, H. von Schullern, and Seidler.

Of the Austrian school Cossa says: "The Austrian theory of the margin of utility, admirable as it is, may be made too prominent. Should it not rather be used to supplement and correct the doctrine of current value, instead of being put in the place of normal value and made to serve as the cardinal doctrine of a new economics based purely on psychology?"

An economic quarterly is published in Vienna, the *Zeitschrift für Volkswirtschaft, Socialpolitik und Verwaltung* (Vienna, 1892).

L. ITALY.

Modern Italy has recently witnessed no small development in the economic sciences. While no great contribution to original thought may have been developed in Italy in political economy, corresponding to Italy's contribution to criminology, nevertheless, a large number of careful and instructive writers have appeared. The following account is in the main abridged from an article

on *The Present Condition of Political Economy in Italy*, by Ugo Rabbeno, in the *Political Science Quarterly* (vol. vi. p. 439).

Early in the century among the most prominent names among Italian economists were Giovanni Fabroni (1752-1822); Luigi Molinari Valeriani (1758-1828); Melchiorre Gioja of Piacenza (1767-1820); Antonio Scialoja (1817-77); Gian Domenico Romagnosi (1761-1835); Arrivabene and others, who were in the main of the school of liberalism and acquainted Italy with the doctrines of Adam Smith, Ricardo, and Malthus.

A little later, and according to Rabbeno, the dominant influence up to 1870, we have the Sicilian economist, Francisco Ferrara (1810-). Ferrara is a strong adherent of the *laissez-faire* school, and has strenuously opposed the coquetting of some of the younger Italian economists with socialist principles. Ferrara was editor of *Giornale di Statistica* (1836-46), and of the *Biblioteca dell' Economista* until 1870. He succeeded Scialoja in Turin. Others of this period were Marco Minghetti of Bologna (1818-86); Girolamo Boccardo, professor at Genoa (1829-); and Stephano Juacini di Caselbuttano (1837-91). To Senator Angelo Messadaglia, professor at the University of Rome (1820-), Rabbeno gives, with Cossa and Boccardo, large credit for the development of Italian economics. Boccardo did much to acquaint Italy with the German economists, as the earlier writers had introduced the English.

About 1870, due in part to the new life developed by the realization of Italian unity and, according to Rabbeno, to becoming acquainted with the German economists and the historical school, a new day began for Italian economics. Old chairs were reestablished at Bologna, Pisa, Parma, and Modena; new ones created at Genoa, Cagliari, Messina, and Rome aided the growth. Emilio Nazzini (1832-), twenty-five years professor at Forlì, in many works and notably in his *Sunto di Economia Politica* (1873), felicitously combined the ideas of the English classical school with those of the modern German economists. Fidele Lampertico (1833-), in his *Economia dei Popoli e degli Stati* (1874-84), soberly set forth the principles of the historical school. Antonio Ciccone (1808-93) studied various subjects historically. Vito Cusumano (1843-) enthusiastically advocated the German ideas, especially in his *Le Scuole Economiche della Germania in Rapporto alla Quistione Sociale* (1875). Ferrara denounced these writings as favoring socialism, but they did their work. Luigi Luzzatti (1841-), the prominent advocate of cooperative banks (*q. v.*), calmly answered him, and in concert with Lampertico and Scialoja, summoned a congress of economists at Milan in 1875. Later on he founded, in Padua, the *Associazione per il Progresso degli Studi Economici*. Ferrara and his school in turn gathered at the Adam Smith Club in Florence; while, as a reply to them, Luzzatti, Forti, and Favaro founded the important *Giornale degli Economisti* at Padua (1875-78). In its issue of September, 1875, it said:

"Between the classical economists at one extreme and the socialistic iconoclasts at the other, there is to-day a mediator in the historical or inductive school. . . . Its adherents do not admit *a priori* either harmony or contradiction of interests. They investigate the world as it is, and not as it ought to be. . . . They admit liberty as a principle; they also put their faith in the energy of individual action. But they do not propose to construct economic romances on the presumption either of necessary harmony or necessary antagonism in human interests. They respect and uphold progress equally with liberty; and where compulsory social action, *i. e.*, the action of the State, serves to prevent conflicts which liberty promotes and to procure benefits which liberty obstructs, they accept in their economic proceedings a directive action, *viz.*, governmental interference."

Among its contributors were Lampertico, Boccardo, Cossa, Ferraris, and others. Carlo Ferraris (1850-) carefully studied administration. Lo Savio similarly studied the State. Gradually the controversy grew less intense, and Minghetti, Lampertico, and Luzzatti revived at Rome the former Florentine *Società d' Economista Politica Italiana*, on conciliatory plans open to all schools. But professional socialism (Martello of Bologna, Fontanelli, Bertolino, and Berardi follow Ferrara) has gained a hold in Italy. Prominent in this school are Carlo Francesco Ferraris of Padua, well known for his monetary studies; Augusto Mortara,

Italian
Historical
School.

who in his *Doviri della Proprietà Fondiaria* (1885) asks for drastic State control of land tenure. Giuseppe Toniolo (1845-) of Pisa, Forti, Ducati, Camillo Supino, Augusto Montanari, Ricca Salerno, and Cognetti hold a more moderate position. Senator Alessandro Rossi and Egisto Rossi have become prominent in the advocacy of a protective tariff.

We now come to some greater names, in the main connected with the Austrian school of economics. First among these is Luigi Cossa, for over thirty years professor at Pavia, where he has developed a seminary of political economy, limited to no school, and noted for wide economic research. His *Guida allo Studio dell' Economia Politica* has been translated into many languages, and tho by no means always accurate, is in many departments the only book covering the whole field. Another name prominent in Italy is Maffeo Pantaleoni (1857-), head of the Bari school of commerce. Graziani, Mazzola, Emilio Cossa, Conigliani, and De Viti are others of this school. They are almost all especial students of financial questions, and more or less connect all economic and financial phenomena with the theory of final utility. Pantaleoni, Mazzola, Zorli, and De Viti are associated in the successfully revived *Giornale degli Economisti* (1886-).

In Florence Franco, Della Volta, and De Johannis edit the *Economista*, holding more orthodox theories. We have still to mention one of the greatest names in modern Italian economics. Achille Loria (1857-), long professor at the University of Sienna and then at Padua. He can scarcely be connected with any one school. He defends the Ricardian theory of rent and value against the Austrian school, and yet on questions of money opposes Ricardo. He goes a long way with the socialists, and yet opposes Marx's theory of value. On the whole he is of the historical school, with a strong leaning to professorial socialism. One more school may be mentioned in Italy, which the Italians call the sociological school, and to which belong Schiatarella, Puviani, Zorli, Lo Savio, Luzzato, Bocardo, and Ugo Rabbino himself, with his able studies of cooperation, and—perhaps greatest of all in this line—Cognetti de Martini, professor at Turin, well known for his sociological studies among the lower animals and primitive civilizations.

M. BELGIUM AND OTHER EUROPEAN COUNTRIES.

Political economy in Belgium is so closely identified with France as to be with difficulty separated from it. Some Belgians we have, therefore, already noticed (see Section I), but Belgium early developed economic writers of special interest in social reforms. Colins and Huet (*q. v.*) belong rather to the history of social reform than of economics, but Professor Émile de Laveleye (1822-92), a pupil of Huet and professor at Liège, stands as high in economics as in social reform. His works on finance, his defense of bimetalism, his studies of primitive property, as well as histories of socialism, have won for him world-wide fame. Charles Périn we have already seen to have made Louvain a center of Roman Catholic social thought; a work which has been ably continued by his successor, Victor Brants. Other Belgians of note are Denis, Ducpétiaux.

HOLLAND.

Holland has considerable activity in political economy. The science is ably taught at the universities of Leyden, Utrecht, Groningen, and Amsterdam, while the reviews, *De Gids* (general), *De Economist* and *Vragen der Tijds* (special), follow closely the best work done in the science. The economy is mainly of the classical school, but with many corrections and modifications. W. C. Mees (1813-84), president of the Netherlands Bank, Cossa calls an authority of the first order, writing on coinage, the famous Bank of Amsterdam, and on workhouse labor. Among living Dutch economists, the first position is held

by N. G. Pierson (born 1839), professor at Amsterdam in 1877, succeeding Mees at the Netherlands Bank in 1884; he was made minister of finance in 1891. He is a strong supporter of the English school, particularly of Ricardo, Mill, Jevons, and Marshall, an energetic opponent of socialism, a free trader without being an optimist, a believer in the moderate intervention of the State in the labor problem. The author of many books and articles in the *De Gids* and *De Economist*, his great work is his *Political Economy*. Other writers who may be mentioned are van Rees (1825-69), with his historical disquisitions; Quack, with his essays on socialism; and Anton Beaujon (died 1890), with his work (in English) on fisheries and his monograph on free trade.

DENMARK.

Political economy in Denmark has had many writers, first, of the mercantilist school, then of the physiocrat, of the classical, and now of the historical German school; even socialism in Denmark being unusually prominent. A political economy society was founded in 1872, and a monthly, the *Nationalökonomisk Tidsskrift*, in 1873. The best writers for this are Professor H. Westergaard, the statistician; V. Falbe-Hansen, head of the government bureau of statistics; W. Scharling, author of valuable monographs on the variation of price; Petersen Studnitz, the editor of the review; Krebs, W. Arntzen, H. Ring, Cl. Wilkens, author of a sociology. All these last five are strong adherents of the German school.

NORWAY AND SWEDEN.

Political economy in Norway has followed the same lines as in Denmark, owing to the identity of language and the political union dissolved only in 1814. Purely descriptive and local discussions in economics have been the main result.

Sweden has an older economic literature, especially as to manufactures. A. Chydenius (1729-1803) was the first in his day. D. Davidson, professor at Upsala, is among the foremost to-day.

RUSSIA.

Economics in Russia began with mercantilism, but Trityakov's lectures (1772) and the translation of *The Wealth of Nations* (1802) first really developed the science. Turguev's monograph on taxes Cossa praises very highly. To-day, economics in Russia are considerably developed, and with such forward strides that Cossa predicts for them a brilliant future. It is ably taught in the universities and in the reviews, the *Economic Journal*, the *European Messenger*, the *Russian Messenger*, the *Journal of the Ministry of Finance*, the *Magazine of Political Science* (founded 1873). Nevertheless, over all hangs the censorship of the press. N. G. Thernyshevskiy attained much prominence in 1859-62, till banished for a while to Siberia in 1863. Among the most prominent to-day are Sieber, and Alexander van Oettingen, who has brought statistics to bear on ethical data.

SPAIN AND PORTUGAL.

Political economy here Cossa calls the mere echo of opinions expressed elsewhere, and especially in France. The *Gaceta Economista* (1860-68) and the proceedings of the Madrid Economic Society (1835-77) and of the Academy of Moral and Political Science, contain some of the best thought. Works on finance and history are the most frequent. The doctrines of the professorial socialists have been attacked by Rodríguez, Sanroma, and Carreras, and defended by Giner, Azacárate, Botello, and Sanz y Escartín.

SWITZERLAND.

Some Swiss writers have been considered in connection with the French school. Leon Walras, the eminent professor at Lausanne, stands at the head of the French school of mathematical economists. See his *Éléments d'Économie Politique Pure* (1874-77) and *Théorie Mathématique de la Richesse Sociale* (1883). Secrétan, the veteran professor at Lausanne, coquets with an ideal socialism.

N. THE UNITED STATES.

To Benjamin Franklin (1706-90) undoubtedly belongs the honor of being the first practical economist in the United States. A work of his on population is of importance, and he produced others in which he attacked slavery, defended paper money, and pointed out that labor is the measure of value. Dickinson's *Letters to a Gentleman* (1765) set forth sound ideas on commerce and money, and Pelatiah Webster declared vigorously against forced currency. A far more important place belongs to Alexander Hamilton (*q. v.*), the author of remarkably able official reports on the public credit, on banks (1790), and on money and manufactures (1791). He consistently supported bimetalism, the institution of one federal bank of circulation, and the necessity of a moderate protection of nascent industries by tariffs. He nowhere countenances protection for protection's sake, his position on this last point being nearly that now occupied by fair traders.

His Report on Manufactures and the memorial drawn up by Albert Gallatin (1832) and presented to Congress from the Philadelphia Convention in favor of tariff reform, deserve to be mentioned as an able statement of the arguments against protection (*q. v.*). The school of Adam Smith, however, had early representatives. Three editions of the *Wealth of Nations* appeared in America in 1789, 1811, and 1812; and Ricardo's principal work was reprinted here in 1810. Daniel Raymond, in his *Thoughts on Political Economy* (1820); and Willard Phillips, in his *Manual of Political Economy* (1828), made known the principles arrived at by Adam Smith and some of his successors. Rae, a Scotchman, settled in Canada, published (1834) a book entitled *New Principles of Political Economy*, which has been highly praised by J. S. Mill, especially for its treatment of the causes which determine the accumulation of capital.

Simpson's *The Workingman's Manual* (1831), and Colton's *Political Economy of the United States* (1848), favor protection. Alexander Everett, in his *New Ideas on Population* (1833), attacks Malthus by attributing errors to him, and by maintaining that the demand for labor and the day's wage increase in proportion as population grows more dense. Stephen Colwell, in his *Ways and Means of Payment* (1859), presents a subtle and accurate analysis of the mechanism of payments. Thomas Cooper of Columbia College, in his *Lectures on the Elements of Po-*

litical Economy (1826), praised without stint by MacCulloch, Francis Wayland, in his *Elements of Political Economy* (1837), and Henry Vethak, with his *Principles of Political Economy* (1838) have all covered more general grounds, in the main favoring the English orthodox economy. The first American to make a real mark in the economic world and to found a school sometimes called the American, sometimes the Pennsylvania school, was Henry Charles Carey (*q. v.*) (1793-1879).

Carey first published an essay on wages (1835), in which he attacked a pessimism which he found lurking in the very essence of the theory of a wages fund. His political economy (1838) gives the theory of value as determined by the cost of production, deducing from this that the increase of profit, being absolute only and not relative, is more than counterbalanced by the increase of wages, which is both absolute and relative, with the result that improvement in the condition of working men must inevitably be continuous. In his *Credit System* (1838) he is preoccupied with the scarcity of money; in his *Past, Present, and Future* (1848) he recants his earlier liberal views, returns with redoubled vigor to the charge against Ricardo and Malthus, and then states his famous theory of the order of cultivation for lands. From this, which he declares overthrows the Ricardian law of rent (*q. v.*), he deduces the laws of (1) increasing returns, and (2) of the greater relative accumulation of capital than of population. He restated these ideas for the popular mind in the *Harmony of Interests* (1850), and his system is presented still more broadly in his *Social Science* (1858)—his most considerable work. Here he stands for the doctrine of a providential identity between cosmic and social laws—a theory which receives more detailed statement in his *Unity of Law* (1872).

Professor Ingram says of Carey: "His aim was, while adhering to the individualistic economy, to place it on a higher and surer basis, and fortify it against the assaults of socialism, to which some of the Ricardian tenets had exposed it. . . . Inspired with the optimistic sentiment natural to a young and rising nation with abundant undeveloped resources and an unbounded outlook toward the future, he seeks to show that there exists, independently of human wills, a natural system of economic laws, which is essentially beneficent, and of which the increasing prosperity of the whole community, and especially of the working classes, is the spontaneous result—capable of being defeated only by the ignorance or perversity of man resisting or impeding its action. He rejects the Malthusian doctrine of population, maintaining that numbers regulate themselves sufficiently in every well-governed society, and that their pressure on subsistence characterizes the lower, not the more advanced, stages of civilization. He rightly denies the universal truth, for all stages of cultivation, of the law of diminishing returns from land. His fundamental theoretic position relates to the antithesis of wealth and value. . . ."

"Ricardo saw in the productive powers of land a free gift of nature which had been monopolized by a certain number of persons, and which became, with the increased demand for food, a larger and larger value in the hands of its possessors. To this value, however, as not being the result of labor, the owner had no rightful claim; he could not justly demand a payment for what was done by the original and indestructible powers of the soil." But Carey held that land, as we are concerned with it in industrial life, is really an instrument of production which has been formed as such by man, and that its value is due to the labor expended on it in the past—though measured, not by the sum of that labor, but by the labor necessary under existing conditions to bring new land to the same stage of productiveness. He studies the occupation and reclamation of land with peculiar advantage as an American, for whom the traditions of first settlement are living and fresh, and before whose eyes the process is indeed still going on. The difficulties of adapting a primitive soil to the work of yielding organic products for man's use can be lightly estimated only by an inhabitant of a country long under cultivation. It is, in Carey's view, the overcoming of these difficulties by arduous and continued effort that entitles the first occupier of land to his property in the soil. Its present value forms a very small proportion of the cost expended on it, because it represents only what would be required, with the science and appliances of our time, to bring the land from its primitive into its present state. Property in

Carey.

land is therefore only a form of invested capital—a quantity of labor or the fruits of labor permanently incorporated with the soil; for which, like any other capitalist, the owner is compensated by a share of the produce. He is not rewarded for what is done by the powers of nature, and society is in no sense defrauded by his sole possession. The so-called Ricardian theory of rent is a speculative fancy, contradicted by all experience. Cultivation does not in fact, as that theory supposes, begin with the best, and move downward to the poorer soils in the order of their inferiority. The light and dry higher lands are first cultivated; and only when population has become dense and capital has accumulated, are the low-lying lands, with their greater fertility, but also with their morasses, inundations, and miasmas, attacked and brought into occupation. Rent, regarded as a proportion of the produce, sinks, like all interest on capital, in process of time, but, as an absolute amount, increases. The share of the laborer increases, both as a proportion and an absolute amount. And thus the interests of these different social classes are in harmony.

"But, Carey proceeds to say, in order that this harmonious progress may be realized, what is taken from the land must be given back to it. All the articles derived from it are really separated parts of it, which must be restored on pain of its exhaustion. Hence the producer and the consumer must be close to each other; the products must not be exported to a foreign country in exchange for its manufactures, and thus go to enrich as manure a foreign soil. In immediate exchange value the landowner may gain by such exportation, but the productive powers of the land will suffer. And thus Carey, who had set out as an earnest advocate of free trade, arrives at the doctrine of protection: the 'coordinating power' in society must intervene to prevent private advantage from working public mischief."

Among Carey's pupils the most original is E. Peshine Smith (*Manual of Political Economy*, New York, 1853), whose account of population is especially noteworthy, and indeed was adopted by Carey himself. W. Elder (*Questions of the Day*, 1871), is a subtle and effective writer, but somewhat inconstant. Robert Ellis Thompson (*Social Science and National Economy*, 1875; *Elements of Political Economy*, 1882; *Protection to Home Industry*, 1886) is the ablest recent representative of this school. W. D. Wilson, who is now of Pennsylvania, has attempted, in his *First Principles* (1875), the very difficult task of making Carey's views harmonize with those of Malthus.

In the period including and following the War appeared Amasa Walker's *Science of Wealth* (1866; eighth edition, 1883), and A. L. Perry's *Elements of Political Economy* (1866). A. Walker and Perry are free traders; Perry is a disciple of Bastiat. The *Science of Wealth* is particularly full in discussing monetary questions. He criticizes the United States banking system and attributes to it the crisis of 1873. Professor John Bascom's *Political Economy* (1859; reprinted in 1874) is a text-book which has been much used in America. It favors monometalism, opposes banks of emission, and proposes the substitution of certificates, based on gold and payable in gold, for greenbacks. Francis Bowen's *Principles of Political Economy* (1856, afterward entitled *American Political Economy*, 1870), has been another popular text-book.

Of President Walker—Amasa Walker's son, General Francis Amasa Walker, president of the Massachusetts Institute of Technology in Boston—Ingram says: "The name of no American economist stands higher." He has written many special treatises, the substance of which is contained in his *Political Economy* (New York, 1883), and summarily presented in his *First Lessons* (1880). His greatest special work is on wages,—*The Wages Question* (1876; new edition, 1891),—in which he draws a clear line between the *entrepreneur* and the capitalist, attacking the wage-fund theory, contending that wages are in reality the residuum of the value left attaching to the product after interest and profits have been deducted. His work on *Money* (1878 and 1891) defends international bimetalism. His *Land and its Rent* (1883) gives a refutation of Carey, dealing similarly with Henry George.

Of the present state of American economics Cossa says:

"American universities have multiplied, new chairs of economics have been founded, administrative fac-

ulties have been organized as at New York and Philadelphia, the American Economic Association (1885) has been formed, special reviews have been brought out, excellent monographs have been published in collected form. Controversies have been carried on through the writings of many young professors fresh from Germany and more especially from Halle; nor has there been lacking a powerful influence wielded by the more matured thought of older professors, who combine a knowledge of all that German science has achieved with an unwillingness to follow blindly its too exclusive vagaries. Such are the leading facts which explain the strides made during the last ten years by the study of economics in America, and account for the eminence there attained by a group of able writers who have nothing to fear from a comparison with the ablest scientific lights of Europe, whether as to knowledge of principles or power of steady work."

Cossa mentions prominently Professor R. T. Ely. With his *French and German Socialism, Labor Movement in America, Socialism and Social Reform*, and constant articles in magazines and the religious weeklies, no man in America has done more fairly and discriminatingly to acquaint the reading public with the importance of the present socialist and labor movement. At the same time his *Taxation in American Cities*, and various articles on railroads and other natural monopolies, have been an important contribution to constructive economic science, showing how the community may adopt many of the good points in socialism without accepting its extreme theories. Again, Professor Ely's *Principles of Political Economy*, revised as *Outlines of Economics*, has been very widely accepted in both England and America, as a popular progressive text-book of general political economy. Finally, as a leader in the foundation of the American Economic Association, of the Christian Social Union (in America), and of the American Institute of Christian Sociology, together with his *Social Aspects of Christianity* and frequent addresses before academic and religious bodies, Professor Ely has done much to promote economic study both in the university and in the churches. First at Johns Hopkins and now as professor at the University of Wisconsin, Professor Ely has been frequently and at least once bitterly denounced as a socialist, but has held his own as an accurate thinker, courageous enough to champion all that is good, and critical enough not to identify himself with what he considers impractical and extreme in socialism.

Professor E. J. James of the University of Chicago is not the author of numerous books, but has been of marked influence with various important monographs on *The Canal and Railway*, on *The Municipality and Gas Supply*, and studies of various federal constitutions. He is even better known by his presidency of the American Academy of Political and Social Science, and his editorship of the *Annals* of the Academy with their frequent contributions not only to historical study, but to original economic theory. Associated with him at the University of Pennsylvania was Professor R. P. Faulkner, prominently known for his translation of Meitzen (on statistics), and his own valuable studies in statistics. Professors Mayo-Smith and E. R. A. Seligman of Columbia are other prominent contributors to American economics from the standpoint of historical studies—Professor Mayo-Smith being especially prominent for his studies of immigration and his recent work on statistics. Professor Seligman on the canons and incidence of taxation. With their associates in the Columbia Faculty of Political Science, Professors Burgess, Munroe Smith, F. J. Goodnow, H. L. Osgood, W. A. Dunning, J. B. Moore, and now J. B. Clarke and F. H. Giddings, they edit the *Political Science Quarterly*, among the most progressive and important of American economic journals. In the West, Professor Henry Carter Adams of the University of Michigan at Ann Arbor, Cossa says, has written "valuable economic treatises on the *Relation of the State to Industrial Action* (1887), on *Taxation in the United States* (1884), and on *Public Debts* (1887)," while as statistician of the Interstate Commerce Commission, and in charge of the United States railway statistics, he fulfils an important function outside of university work. Professor J. W. Jenks of Cornell is the able secretary of the American Economic Association, and a care-

R. T. Ely.

E. J. James.

H. C. Adams.

ful student and writer on the important questions of trusts, monopolies, etc.; Professor John B. Clark of Columbia University, a President of the American Economic Association, is author of a *Philosophy of Wealth*, and various monographs; Professor J. K. Commons of Syracuse University, stands with Professors Ely and Bemis among the more advanced of American economists in their friendship to socialistic ideas (without at all being socialists), and is author of *The Distribution of Wealth, Proportional Representation*, and various articles in favor of monetary, electoral, and Christian social reforms; Chancellor James H. Canfield, of the University of Nebraska, is a Vice-president of the American Economic Association, and a writer on taxation and the tariff; Professor E. W. Bemis, recently of Chicago University, is a writer of monographs and careful studies of labor organizations and the municipalization of natural monopolies. Separate somewhat from the above writers in holding distinctively more for the necessity of historical study and the deduction of cautiously pronounced principles, is Professor W. J. Ashley, now of Harvard University, formerly of Oxford, England, and then of Toronto. Cossa says of him that his works on the *Economic History of England* are justly celebrated. His criticisms of Thorold Rogers and others of his school are trenchant, but entitled to the greatest weight.

Among the more conspicuous upholders of the traditions of the classical school in economics are Professors Charles F. Dunbar and W. G. Sumner, at the head respectively of the Department of Economics in Harvard University and at Yale. Professor Dunbar is an editor of the *Quarterly Journal of Economics*, founded at Boston in 1885, and published for Harvard University, and is particularly at home on questions concerning currency and credit, as in his *Chapters on the Theory and History of Banking* (1892).

Professor W. G. Sumner of Yale has written on the tariff, American currency, bimetalism, wages, civil service reform, and is popularly known for his *What Social Classes Owe to Each Other*, in which he comes to the strongly asserted position that they owe nothing. Among others on the whole of the classical school, are Professor A. T. Hadley, also of Yale, a careful writer on

The Classical School.

railways, the Interstate Commerce Law, etc., and a student of the facts of wages, etc. Professor F. W. Taussig of Harvard is prominent for his studies of the tariff and his defense of monometalism in his *Silver Question in the United States*, and various economic articles. Professor J. Lawrence Laughlin is at the head of the economic department of University of Chicago, and a writer on bimetalism, the tariff, and general studies of political economy. Professor Simon Newcomb of Washington has forcibly written on general political economy from the *laissez-faire* position. More original than any of the above men, according to Cossa, either of the historical or classical school, and coming nearer to the Austrian school than any other, and yet developing original principles and positions of their own, are

F. H. Giddings.

Professor F. H. Giddings of Columbia University and Professor S. N. Patten of the University of Pennsylvania. Professor Giddings is especially prominent for his monographs on the province and theory of sociology developed now into his important treatise on *Sociology*. Professor Patten has written brief but important studies on the premises of political economy and concerning the concepts of utility. His monograph on the *Theory of Social Forces* (1896) shows how far he studies the psychologic side of economics. With this school stands Professor Clark, whom we have also noticed above. President E. B. Andrews of Brown University is a strenuous advocate of bimetalism, and well known for his works on recent American history and general political economy. Professor E. R. L. Gould of the University of Chicago, both as a scholar and as an investigator for the United States Census and Labor Commission, has carefully investigated the conditions of working men, and of the poorer classes, both in Europe and America. Professor A. G. Warner has written the one complete book on *American Charities*, besides studying relief methods in Germany and other countries. Professor E. A. Ross has defended bimetalism and written on taxation. Many names perhaps as important as some of those mentioned must be omitted, as not bearing particularly on Social Reform. Professor D. R. Dewey of the Institute of Technology in Boston has devoted him-

self to statistical studies. John Graham Brooks, as lecturer, writer, and expert for the Census, has carefully investigated the Norwegian company system of temperance reform and various relief methods in Germany and France, as well as in this country. Professor Lester F. Ward is one of the chief sociologists in the country. Still others, as well known as most we have mentioned, though without being professors of political economy, write on economic themes with learning and ability. Such are Edward Atkinson, the statistician; Carroll D. Wright, United States Labor Commissioner; Dr. Albert Shaw of the *Review of Reviews*; Mr. Charles B. Spahr of the *Outlook*; Mr. George Gunton, president of the School of Economics, New York City; Mr. Henry George and T. G. Shearman, the prominent single-tax advocates; the Rev. N. P. Gilman, editor of the *New World*; the Rev. Dr. Washington Gladden of Columbus, O.

V. RADICAL VIEWS IN POLITICAL ECONOMY.

For the detailed economic views of the various schools of social reform—we must refer the reader to the various articles, Socialism, Individualism, Anarchism, the Single-Tax, Eight-Hour Movement. We here simply point out that there are many writers who from very various standpoints and sometimes with an economic ability comparable to that of the professed economists considered above, have presented views quite opposed to any of the views stated in this article. Such writers usually deny utterly that the so-called professed economists have reached any settled conclusions, or have even done much for the cause of economic truth. There is some ground for this view.

Said Mr. Leslie Stephen (presidential address at the annual meeting of the Social and Political Education League, March, 1892): "There is no science of sociology, properly scientific—merely a

heap of vague empirical observations, too flimsy to be useful in strict logical inference." Mr. Kidd says, speaking of "probably the largest section" of the community (*Social Evolution*, p. 5): "They feel that some change is inevitable. . . . But at present they simply sit still and wait. They have no indication as to the direction in which the right path lies. They look in vain to science and authority for any hint as to duty. They are without a faith, for there is at the present time no science of human society." He says again (*Social Evolution*, p. 236): "It has to be confessed that in England during the nineteenth century the educated classes in almost all the great political changes that have been effected have taken the side of the party afterward admitted to have been in the wrong; they have almost invariably opposed at the time the measures they have subsequently come to defend and to justify. This is to be noticed alike of measures which have extended education, which have emancipated trade, which have extended the franchise. The educated classes have even, it must be confessed, opposed measures which have tended to secure religious freedom and to abolish slavery. The motive force behind the long list of progressive measures, carried during this period, has in scarcely any appreciable measure come from the educated classes; it has come almost exclusively from the middle and lower classes, who have in turn acted, not under the stimulus of intellectual motives, but under the influence of their altruistic feelings."

Even Professor Taussig of Harvard, writing in *The Nation*, December 28, 1893, and referring to "fantastic" radical social proposals, says: "The temptation is strong under such conditions, to hold fast to authority and accepted doctrines and to refuse to give aid and comfort to the enemy by admitting that the theories of current political economy are not settled and established scientific truths. But, in fact, there are few of them which the criticism of the last quarter of a century has not impugned more or less. The doctrines of exchange, money, international trade have suffered least; those as to production and distribution most. The latter, it must be confessed, need to be largely recast."

Lack of Science.

Such being the asserted condition of political economy to-day, the leaders of the various schools of reform, and especially among working class reforms, treat professorial economics with an ill-concealed contempt; yet the same men are often very glad to welcome or even to strain any admissions which may happen to drop from the professor's pen and can be used to favor any desired end.

The radical school which comes nearest to economic doctrines accepted in the universities, and to which modern economists on their part have shown themselves most friendly, is that of the socialists. Socialism, indeed, of the Marxist type pro-

Socialism. fessedly bases itself upon the principles of value and rent held by Ricardo and the classical school, and on that basis constructs views the opposite of the classical. On the other hand, many economists of the historical school come so near to socialism as often to be called socialists by their critics. The economic basis of socialism will be considered under socialism, yet such writers as Rodbertus, Marlo, and Marx, in Germany, and the writers of the *Fabian Essays* in England, cannot be ignored in the field of political economy. Ingram says in his *Britannica* article on political economy :

"With such writers as St. Simon, Fourier, and Proudhon, Lassalle, Marx, Engels, Marlo, and Rodbertus (who, notwithstanding a recent denial, seems rightly described as a socialist) we do not deal in the present sketch (see Socialism); but we must recognize them as having powerfully stimulated the younger German economists (in the strict sense of this last word). They have even modified the scientific conclusions of the latter, especially through criticism of the so-called orthodox system. Schäffle and Wagner may be especially named as having given a large space and a respectful attention to their arguments. In particular, the important consideration, to which we have already referred, that the economic position of the individual depends on the existing legal system, and notably on the existing organization of property, was first insisted on by the socialists. They had also pointed out that the present institutions of society in relation to property, inheritance, contract, and the like are (to use Lassalle's phrase) 'historical categories which have changed, and are subject to further change.'"

Of the socialists of the chair, we have spoken above. See also SOCIALISTS OF THE CHAIR.

In England socialism has so influenced economic thought that Sydney Webb can write (*Socialism in England*, p. 46) :

"That one competent economist, not himself a socialist, publishes regretfully to the world that all the younger men are now socialists, with many of the professors." And that "Professor Henry Sidgwick (professor of moral philosophy, Cambridge), the most cautious of men, even publishes an article with a view to correct the world's mistaken impression that political economy is opposed to socialism, and shows that, on the contrary, the socialist proposals are a plain and obvious deduction from accepted economic principles." (*Contemporary Review*, November, 1886.)

Mr. Webb says further (*idem.*, p. 47) :

"It was computed in December, 1887, that out of a total of 14 courses of lectures on economics being delivered under the auspices of various public bodies in London, eight, and possibly more, were being given by professed socialists. I have been told that one of the university extension societies lately found some difficulty in obtaining young economist lecturers

sufficiently free from what some of its older members thought the socialistic taint."

Outside of Germany and England the influence of socialism on professional economic thought is not so marked, but in Belgium, France, Austria, and Italy, we have seen its influence strongly marked on more than one writer, while in the United States such men as Professors Ely, Bemis, Commons, Jenks, Adams, James, and others of the historical school are at least as socialistic in their views as many of the so-called Katheder Socialisten in Germany. Everywhere we thus see the influence of socialism upon the economists.

Says Professor de Laveleye: "It was at one time imagined that the means of combating socialism would be found in the teachings of political economy; but, on the contrary, it is precisely this science which has furnished **Socialism and Political Economy.** the socialists of to-day with their most redoubtable weapons." (Introduction to *Contemporary Socialism.*)

The value of these utterances, however, can easily be both over- and underestimated. They by no means indicate that political economists are on the high road to socialism. There is even among them at present a reaction against socialism. Frightened by their own admissions, they are drawing back and trying to show that, while there is considerable truth in socialism, society need not accept the whole socialist position.

On the other hand, the value of these admissions by the economists must not be under-estimated. Their main use is to prove that there is no case to be drawn from political economy against socialism. Says Mr. Kidd, speaking of socialistic propositions (*Social Evolution*, p. 208): "A somewhat startling admission has to be made. . . . It is that the arguments by which their advocates lead up to them are unanswered, and even unanswerable, from the point of view from which the greater number of their critics have assailed them."

Coming to ask what is the economic basis of the socialist writers, one must in the first place distinguish between the early Utopian socialists and later evolutionary socialists, and secondly, as far as their economic basis goes, one must distinguish between two main schools of socialists. The early communists, Plato, More, Doni, Campanella, Harrington; the radical social reformers of the eighteenth century, Rousseau, Mably, Morelli, De Warville, Babeuf; the Utopian socialists of the first half of the present century, Owen, Fourier, Gall, St. Simon, Enfantin, Buchez, Considerant, Cabet, Weitling, even Louis Blanc, had, properly speaking, no economic basis for their socialism. They had various philosophic views, and often acute sociological principles, as is illustrated by the connection between Comte and the St. Simonians; but they had little or no political economy. Modern socialism has however developed considerable strict economic thought, principally of two schools, the German school of so-called scientific socialism, and the English school of Fabian socialism. In Germany, Rodbertus, Marlo, Marx, Engels, and to a less extent, Lassalle, took the then generally accepted Ricardian theory of rent, and the position that labor is the source of all exchange, which had come to them from Adam Smith, and, without questioning these, ably and with great acumen built upon them the socialistic superstructure of surplus value, appropriated from the working man by the capitalists, and the condemnation

of the working man, through the asserted "iron law of wages," to receive the lowest wage that would support and reproduce the workman's life. The English socialists of the Fabian Society on the other hand have denied that labor is the source of all value, but have agreed rather with Jevons (see VALUE), and on the whole have been influenced economically by J. S. Mill as much as by Marx. In their ideals these schools agree completely, but differ in their economic analyses.

Value in exchange, according to the English school, depends in part at least upon final utility, and is produced by land, labor, and capital; so that the socialization of land, labor, and capital is necessary to a right production and distribution. (See SOCIALISM.) Around these two schools cluster all shades of economic and much very obscure socialistic thought.

Socialism, however, is by no means the only radical school that has developed its own economic thought. Less known perhaps in professorial circles than any other radical school, and yet with some very clear economic thought, is the so-called eight-hour philosophy.

Ira Steward, George E. McNeill, and George Gunton have argued very ably that wages depend neither on a wage fund, nor on the amount of production, nor are reduced to the lowest point which supports life, but depend on the cost or standard of living held by the various classes of wage-earners; they argue that this standard of living is developed by men's wants; that men's wants are very largely the result of leisure, and that therefore the supreme way to improve the wage-earner's condition is to shorten his hours of work. For the details of this able view, see SHORT-HOUR MOVEMENT.

Coming to individualist views, we have first the economic views as to rent, interest, wages, etc., developed by Mr. Henry George, who finds in the private monopoly of land the source of at once high rent and low wages. His views, while they are accepted to-day by few trained economists, are admitted by all to be at once brilliantly stated and based (albeit with fatal relative exaggeration) on some profound economic as well as ethical truths. (See the SINGLE-TAX.) See also Flürscheim for an important modification of Mr. George's view.

More strictly individualistic are the radical views of such writers as Wordsworth Donisthorpe in his *Individualism, A System of Politics*; Herbert Spencer in his various works; Auberon Herbert with his Voluntaryism. Still more extreme are the economics of the so-called philosophical anarchists, the American, Joseph Warren, with his view that cost determines value, and his resultant conclusion that, if there were no law, each man would receive the full value of

what he produced; the great French philosopher, and no mean economist, Proudhon, with his critique of private property; the German Max Stierener, and B. R. Tucker, the subtle

editor of *Liberty* (New York). Such are a few, at least, of the radical social reformers of various schools who have developed economic thought. The details of all their views, and a discussion of them, will be found under the respective names of the writers and their schools; but neither the theories themselves, nor their influence upon economic thought, can be ignored in any study of modern political economy.

References: Blanqui's *Histoire de l'Économie Politique en Europe* (1837-38) translated into English; J. K. Ingram's *History of Political Economy* (1888); Luigi Cossa's *Guida* (revised edition, and translated into English as *An Introduction to the Study of Political Economy*, 1893), is the most complete, though not the most reliable history. Some chapters of Dr. Gustave Cohn's *System der Nationalökonomie*, have been translated by Dr. J. A. Hill, and published by the American Academy of Political and Social Science as *A History of Political Economy* (1894). S. S. Price has a convenient *History of Political Economy since Adam Smith* (1891).

Among German works Ingram mentions a brief but excellent history by H. von Scheel in the *Handbuch der politischen Oekonomie* (really a great encyclopedia of economic knowledge in all its extent and applications), edited by Gustav Schönberg (1882); the *Geschichte der National-ökonomik in Deutschland* (1874), by Wilhelm Roscher; a vast repository of learning on its subject, with occasional side-glances at other economic literatures, *Die neuer National-ökonomie in ihren Hauptrichtungen*, by Moritz Meyer (third edition, 1882); a useful handbook dealing almost exclusively with recent German speculation and policy.

Of French works Ingram says: "Some of the biographical and critical notices by Eugène Daire and others in the *Collection des Principaux Economistes* will also be found useful, as well as the articles in the *Dictionnaire de l'Économie Politique* of Coquelin and Guillaumin (1852-53), which is justly described by Jevons as 'on the whole the best work of reference in the literature of the science.'"

See also the various topics, CAPITAL, LABOR, etc.

For brief studies of the great writers, see W. J. Ashley's *Economic Classics*, a series of reprints (1895). For brief statements of the more orthodox economy, see W. S. Jevons' *Political Economy Primer* (1878); A. and M. P. Marshall's *Economics of Industry* (1890), and F. A. Walker's *First Lessons in Political Economy* (1891). A short political economy of the more advanced school is Professor J. E. Symes' *Political Economy* (1889). Among the longer but representative works are J. S. Mill's *Principles of Political Economy* (1892), which Cossa calls "even now the best English treatise on economics." Professor Marshall, with his yet unfinished *Principles of Economics* (vol. i. 1890), is considered by many economists the leading English authority to-day. Professor R. T. Ely's *Outlines of Economics* (1893) is largely used, as a text-book of the more advanced type. One of the best of the few books on its important subject is J. N. Keynes' *Scope and Method of Political Economy*. The best English dictionary of economics is the *Dictionary of Political Economy*, now being published, edited by R. H. I. Palgrave. (See also Bibliography in the Appendix to this Encyclopedia.) Among the best books on political economy from the socialist point of view are *The Fabian Essays* (1890), and Karl Marx' *Capital* (tr. 1889). Henry George (*Progress and Poverty*, 1879) presents the economic views of the Single-Taxers. George Gunton (*Progress and Wealth*, 1889) gives the important economic

view of the eight-hour philosophy. Wordsworth Donisthorpe (*Individualism*, 1889), and B. R. Tucker (*Instead of a Book*, 1893), give the radical individualistic and anarchistic views. For particular subjects in political economy, see the respective subjects; see also SOCIOLOGY.

POLITICAL SCIENCE may be defined as the science of politics, or the science of the constitution and government of the State or body politic. Among the subjects of which it treats are the principles on which States are constituted; the forms they may assume; the placing of the supreme power or sovereignty; the functions of government, the conduct of the legislative, executive, and judicial powers; the defense of the people; the liberties of the people; diplomacy, etc., etc. In Professor J. W. Burgess' *Political Science and Constitutional Law*, he treats of The Nation, The Geographical Distribution of Nations, National Political Character, The State (its origin, form, and ends), The Formation of Constitutions, Individual Liberty, and Civil Liberty. For a study of the various features of political science, see STATE; NATION; NATURAL RIGHTS; DEMOCRACY; CONSTITUTIONALISM; INDIVIDUALISM; SOCIALISM; also CONGRESS; PARLIAMENT; PRESIDENT; JUDICIARY; TAXATION; FINANCES, etc., etc.

In this article we are concerned simply with the history of political science. It may be said to have begun with the Greeks. The laws of Manu in India, the sayings of Confucius and Mencius in Chinese, the sacred books of the Hebrews, and the priestly traditions of Egypt and Babylon all enunciate occasionally apothegms as to government, chiefly in advice to kings, but there is no approach to a systematic view of the constitution of States till the Greeks, and with them not till the time of Plato and Aristotle. Homer and Solon give occasional advice as to rulers, and Aristophanes satirizes the folly of the people and the wickedness of demagogues, but this is not political science. In the following history we give only an outline, referring the reader to different articles for details.

I. CLASSIC TIMES.

Greek political science begins with Plato and Aristotle, the Thucydides, Socrates, and others had already contributed valuable ideas. With them, as with all Greeks, the State is supreme, and the origin of the State is discussed in the same way as the origin of the universe. It is both natural and divine. The various forms of government are distinguished between. It may be monarchical, tyrannical, aristocratic, plutocratic, democratic, oligarchical. Plato's *Republic* develops his ideal of a communal State. (See PLATO; COMMUNISM; FAMILY.) His *Laws* outline the State he considers more immediately possible; in the *Politics* he describes the ideal statesman. The best condition is to be under a perfectly wise ruler unfettered by laws; the worst condition is to be under a foolish ruler without laws. In fact, laws are a clumsy necessity. The perfect State

is necessary to the perfect citizen. The family should be subject to the State (See PLATO.)

Aristotle begins with the concrete and the actual, as Plato with the ideal. In his *Politics* he analyzes the State. He is said to have studied 360 constitutions. His State is a community, a large household. Man cannot exist in solitude. No passage in political literature is better known than his "ἄνθρωπος φύσει πολιτικὸν ζῶον." A cityless man must be either superhuman or beneath contempt; he must be in a state of perpetual strife. The State is natural. It has grown up from the household and the village community. The head of the family was the first king. Slaves are a necessity, but must be well treated. Communism is not practical. Aristotle says: "Carefulness is least in that which is common to most; for men take thought in the chief place for their own, and less for the common stock." Yet friendship must rule; "friends' goods are common." But this communism must start from the individual, not from law. "The pleasure we take in anything is increased beyond expression when we esteem it our own; and I conceive that the individual's affection for himself is by no means casual, but is of man's very nature."

The State is the continuity of the race within a manageable compass, and must have an enduring constitution. Pollock's *History of the Science of Politics* thus puts Aristotle's views:

"A normal or right constitution is that which is framed and administered for the common good of all, whether the sovereign power be with one, with few, or with the many. A constitution framed in the exclusive interest of a class, even tho it be a majority of the whole, is wrongful and perverse. Royalty, aristocracy, and commonwealth (πολιτεία) are the normal forms; their respective corruptions are tyranny, oligarchy, and democracy—tyranny being a monarchical government worked for the advantage of the monarch over all subjects; oligarchy, the government of a privileged class for the advantage of the rich over the poor; and democracy, the government of the multitude for the advantage of the poor over the rich." (See ARISTOTLE.)

Later Greek thought turned more upon questions of morals than of politics. The Cynics protested against the exaltation of the State, and the Stoics furnish the connecting link between Greek and the Roman political conceptions. In the stoical conception of the individual conforming his life to natural laws is the germ of that doctrine of natural rights which has played so large a part in political science. Rome, not Greece, is the typical home of the Stoic. "To the Stoics and the Roman lawyers," says Lecky (*History of European Morals*, vol. i., chap. ii.), "is mainly due the clear recognition of the existence of a law of nature above and beyond all human enactments which has been the basis of the best morality, and of the most influential tho most chimerical political speculation of later ages."

But Rome's genius was practical rather than philosophical. Polybius, in his analysis of the Roman constitution, and Cicero, in his presentations of Greek thought, are almost the only writers among the Romans to directly treat of political science. The real contribution of Rome to this science is the jurisprudence which was built up by the juriconsults.

Rome.

It gave forms and laws to the customs of a great State. It sought to base government on ideas of liberty and justice. Even when Rome grew most imperial she preserved the forms of liberty. It has been said that "the theory of the Roman Empire was that of a representative despotism, and that under the empire "the various offices of the republic were not annihilated, but gradually concentrated in a single man" (Lecky, *History of European Morals*, vol. i., chap. ii.). Greece in theory had made the State dominant over the individual; Rome in theory made the individual dominant over the State. It is not the only case where the individual has in fact been more free under the former than under the latter condition. Out of Rome arose the political problems of

II. THE MEDIEVAL PERIOD.

The main political problem of the Middle Ages was the relation of Church and State. Rome had bequeathed to the successors of Charlemagne the traditions of a great State. The Church had built upon the simple teachings of Christ a great secular power. Thomas Aquinas (*q.v.*), in a treatise *Of the Government of Princes*, left unfinished, but completed by his disciple, Ptolemy of Lucca, argued the independence of the Church. Dante (*q.v.*), in his *De Monarchia*, defended the independence of the State. (For the discussion, see AQUINAS; CANON LAW; DANTE; MIDDLE AGES.) Both sides admit the need of a wise ruler. Only under such a ruler, said Dante, is freedom possible.

"For citizens are not for the sake of the consuls, nor a nation for the king; but contrariwise the consuls are for the sake of the citizens, the king for the sake of the nation. For as a commonwealth is not subordinate to laws, but laws to the commonwealth, so men who live according to law are not for the service of the lawgiver, but he for theirs; which is the philosopher's opinion in that which he hath left us concerning the present matter. Hence it is plain also that the consul or king in regard of means be the lord of others, yet in regard of the end they are the servants of others; and most of all the monarch, who, without doubt, is to be deemed the servant of them all."

But this, tho the main, was not the only problem of the Middle Ages. Out of the unsettled condition of the times, out of the battle between the conflicting claims of emperor and pope, of kings and barons, of empire and free city, rose the claims of the right of local government and the conception of limited monarchy.

III. THE MODERN PERIOD.

Pollock says that the modern study of politics begins with Macchiavelli. He seems rather the link between the Middle Ages and the present, but to belong to neither. Concerning the vexed question of how to interpret his great work, *The Prince*, see MACCHIAVELLI; but whether it be interpreted as satire or heartless policy, Macchiavelli shows with masterly keenness how an unlimited monarch may bend all to his will. He is modern in his study of facts; he is medieval in his worship of the State and kingly power. Bluntschli considers his great service to have been that he divorced political science from theology. To Jean Bodin (*q.v.*), in his *Of the Commonwealth*, we owe the modern and neces-

sary concept of sovereignty (*q.v.*). Sovereignty is not above moral law; justice is its best support; yet the State is above enactments. "The State can do no wrong." There are, however, laws, like those of the family, of property, even of the succession to the French crown, with which, Bodin says, the State cannot meddle. From the inviolability of property he deduces the consequence that even the most absolute monarch cannot tax his people without their consent. We see here plainly the influence of the Reformation, the emphasis upon individual responsibility, and the right of the individual to judge even the king. On this question Luther, Reuchlin, Colet, More, Erasmus, Politian, Calvin, Bacon, all wrote. Hugo Grotius declares the State to be "the complete union of free men who join themselves together for the purpose of enjoying law and for the sake of public welfare" (*De jure belli*, vol. i., chap. i., § 14). This is almost the social contract.

Of the early English writers on political science Pollock says:

"Fortescue, both in his book, *De Laudibus Legum Angliæ*, and in his less known treatises on the Law of Nature and the Monarchy of England, is careful to represent the king's power as not absolute but limited by the law, or, to use the language borrowed by him from St. Thomas Aquinas' *De Regimine Principum*, not 'royal' but 'political.' The king is the head of the body politic, but can act only according to its constitution and by the appropriate organs in each case. And it is said in general terms that the king's power is derived from the consent of the people. But the question where political supremacy really lies is not followed up. Neither is any definite theory of the origin of government put forward. More's *Utopia* calls for mention on account of its literary fame; but tho it contains incidentally not a few shrewd criticisms, open and covert, on the state of English society in the first quarter of the sixteenth century, we cannot count it as an addition to political science. It is a Platonic or ultra-Platonic fancy, bred of the Platonism of the Renaissance. Even more than the *Republic* of Plato it belongs to the poetry as distinguished from the philosophy of politics. In the *De Republica Anglorum*, or *English Commonwealth*, of Sir Thomas Smith, first published after the author's death in 1583, we find something much more like a forerunner of Hobbes. Indeed, so clear and precise are Smith's chapters on sovereignty that one is tempted to think that he must somehow have had knowledge of Bodin's work."

Early Writers.

More modern in its appeal to facts is Montaigne's great *Essai des Loix*. Like Aristotle, he endeavors to study States and laws as they are, and from them to construct his generalizations. Much of his information is unreliable, and his writings are therefore of unequal value; but much is also of very great value, and he may be considered almost the father of modern historical research and comparative political science. His interpretation of the English Constitution emphasizes the necessity of separating the legislative, judicial, and executive powers, an idea which has played so large a part in America, but is to-day much criticised, especially in England. He feared the corruption of democracies, yet held that liberty should be the governing political principle.

This brings us to Hobbes (*q.v.*) and his *Leviathan*. (For a fuller discussion of the origin of and the difference between Hobbes', Locke's, and Rousseau's forms of the theory of natural rights and the social contract, see NATURAL RIGHTS.) With Hobbes all men are

by nature free and equal ; but since in this state without government they would constantly be at war, they have compacted together to give over their natural rights to some person or persons who have the sovereignty, and, having given away their rights, they no longer have them, and hence they can only absolutely obey. The sovereign is irresponsible and absolute. The people are his subjects.

The Social Contract.

With Locke, the people have made a similar compact, but have reserved the right to withdraw their allegiance when they will. Hence the right to revolution, his *Essay on Civil Government* being an elaborate defence of the Revolution of 1688. (See LOCKE ; HOBBS.)

Rousseau's social compact is one where the people surrender their rights to all the people and not to the sovereign. "Each of us puts his person and faculties in a common stock under the sovereign direction of the general will ; and we receive every member as an inseparable part of the whole." (See ROUSSEAU.)

We pass over these theories in brief because they are discussed under the special articles above referred to, but these theories have changed the whole modern world. Entering into the thought of France through Rousseau and numerous writers of the eighteenth century (see FRANCE), the doctrine of the natural rights of man was the main intellectual cause of the French Revolution. Crossing the ocean, it produced various Declarations of Rights in various States, as notably in Virginia ; it molded the Declaration of Independence of the United States, and has affected the whole history of the United States even more than that of France. Federalists and Jeffersonians, Republicans and Democrats, broad and strict constructionists have differed in the interpretation of the United States Constitution, but all have been agreed that government can only do that which the Constitution empowers it to do, or, at least, that which can be read into the Constitution. All else is reserved to the individual ; constitutions and charters are compacts by which the sovereign voters allow the government certain acts. In Europe, governments, municipal, State, or national, can do what they will. In the United States, the presumption is against government action ; and city, State, and even the Federal Government can do only what the people vote that they may do ; action beyond this often requires constitutional amendments most difficult to obtain. Under which system the individual is most free is to-day a debated point. A growing minority in the United States believe that there is really more individual freedom in Europe than in the United States ; that the United States is bound by "the dead hand" of an iron Constitution, framed for conditions which have long passed away, and that, as in the case of Greece and Rome, the greatest freedom is not in that country which theoretically most exalts the individual over the State, but in that country where the power of a democratic State is greatest. The individual in Rome and America is freed from the State, a member of which he is, to be delivered, bound hand and foot, to private despotisms in which he has no voice. Whether this view be correct or not, it will be seen how

far these theories of the social compact and of natural rights have affected the world, and particularly the United States. (See CONSTITUTIONALISM ; NATURAL RIGHTS.) In England first arose a check to these theories and more balanced views. Hume brilliantly showed the fallacy of the social contract, and Blackstone carefully built up where Hume tore down. Of Blackstone, Pollock says :

"While Rousseau's *Contrat Social* was almost fresh from the press, Blackstone was handling Locke's principles in England after quite another fashion. If we dismiss from our minds Bentham's fervid criticism, and approach Blackstone in an unprejudiced mood, we shall find that he not only was faithful to his lights, but materially improved on Locke in more than one point. For one thing, he distinctly refuses to believe in the state of nature as an historical fact, and thereby avoids a difficulty which Locke had palliated rather than met by ingenious but weak excuses. 'Society had not its formal beginning from any convention of individuals.' Blackstone treats the family as the unit of society, and reduces the original contract, tho he does not abandon the term, to the fact that men hold together in society because they cannot help it."

The Social Unity.

Burke, however, most brilliantly criticised the theory of the social compact. His theoretical statements are intertwined with his historical and political writings, and this fact renders him at times contradictory, but also saves him from going to extremes. He opposes both Protestant oppression in Ireland and Jacobin violence in France. His *Reflections on the French Revolution* is explained by his *Appeal from the New to the Old Whigs*. He says : "Metaphysics cannot live without definitions, but prudence is cautious how she defines." He believes in the people almost as much as Rousseau, and tells us that "as a law directed against the mass of the nation has not the nature of a reasonable institution, so neither has it the authority ; for in all forms of government the people is the true legislator." Even the whole people "have no right to make a law prejudicial to the whole community." But he asks : "What are the people ? 'A number of vague, loose individuals' are not a people, neither can they make themselves one offhand by convention. A nation is born of history ; it is a compact of the living, the dead, and those yet unborn. It is far more natural than an imaginary 'state of nature,' for 'art is man's nature.'" Rousseau's *Contrat Social* Burke calls "chaff and rags, and paltry blurred shreds of paper about the rights of man." (See BURKE.) This study of facts leads us to

IV. THE PRESENT CENTURY.

Here the first great name is Bentham. His *Fragment on Government* appeared in 1776, but he belongs distinctly to the nineteenth century. He bases the State on sovereignty, and, laying the foundation of the modern English theory of the State, says : "When a number of persons (whom we may style subjects) are supposed to be in the habit of paying obedience to a person, or an assemblage of persons, of a known and certain description (whom we may call governor or governors), such persons altogether (subjects and governors) are said to be in a state of political society."

Laws are the commands of the supreme governor, or, to use the term now adopted, the sovereign. And the field of the supreme governor's authority is indefinite. As to the subject, Bentham says that while his duty is, as Hobbes says, to "obey punctually," his right is also to "censure freely." The basis of censure is to be the Benthamite measure of right; utility, "the greatest good of the greatest number." (See BENTHAM.)

Austin (*q.v.*) is a writer whose works have been much discussed and much misunderstood. He writes abstractly and dogmatically, developing the clear concept of sovereignty with little reference to moral, social, or historical considerations. This lack, Pollock says, "has been supplied by Sir Henry Maine in the two last chapters of his *Early History of Institutions*, and later by Mr. Frederic Harrison, in the *Fortnightly Review*. Still more lately Professor Holland has exhibited the results of the English school in a form wholly freed from the old controversial encumbrances, and thereby freed also from the extreme insularity which has prevented Austin's work entirely, and Bentham's to a great extent, from being appreciated by Continental thinkers."

The German school of political science is characteristically transcendental. It begins with Kant's *Rechtsstaat* and the German *Naturrecht*; it is developed in Fichte's socialistic treatment of his early individualistic conception of the State as composed of individuals, and Hegel's individualistic treatment of a socialistic conception of the State; it results in the paternalism of German State socialism, and the democratic socialism of Marx and Lassalle.

German political science, however, like German political economy, has developed a strong historical school. Even Hegel, in his theories, has much reference to history. Savigny, however, is the great German founder of the historical school. The problem, however, most discussed in political science in the present century has been the function and the extent of the function of the State. Wilhelm von Humboldt in 1791 argued that the sole duty of the State was the maintenance of the legal security of each individual; but most Germans have differed from this. Fichte notably broke through these narrow bounds. Friedrich J. Stahl considers the State "the union of the multitude to an ordered common existence, the setting up of a moral authority and power, exalted and majestic, to which the subjects must submit." Fr. Schmittbenner declared the State to be "an ethical organism for the purpose of giving public expression life, law, well-being and culture." Waitz (*Politik*, 1862) says, "The State is not something arbitrarily made; it does not arise by a contract between men nor by the power of one or more individuals. The State grows like an organism, but not according to the laws, nor for the ends of mere natural life; it has its foundation in the higher moral tendencies of man, and is a sphere for the realization of moral ideas; it is not a natural but a moral organism."

More recent thought of this school has em-

phasized the element of nationality. Welcker in Freiburg, Lieber in New York, Laurent in Ghent, Mancini and Padelitti in Rome, Pierantoni in Naples, and notably Bluntschli in Zürich and Munich, have emphasized this thought.

The opposition to the historical and national school has been mainly in England. Mill criticized the paternal theory of the State from the radical standpoint, though he later in life in many practical ways modified this and learned even to call himself a socialist. (See MILL.) Buckle and Bagehot apply the methods of natural science and environment to the theory of the State; Baron Eötvös in Hungary, Laboulaye in France, Morley in England, follow Mill's liberalism. Herbert Spencer bitterly opposes any extension of the function of the State, in which he is opposed by Huxley (*q.v.*) and Ritchie (*q.v.*). Latest political science, however, devotes itself more to special subjects and historical research and analysis. Gneist in Germany, Stubbs, Anson, and Dicey in England, Macey in America, are among the chief students of the English Constitution. Laboulaye writes admiringly of the American Constitution. Treitschke, Lorenz von Stein and others have studied Prussian and German administration. De Tocqueville (early in the century) and Bryce and Lecky (recently) have written general studies of American democracy. Paul Janet, in France, has written what some consider the best general history of political science.

POLITICAL SCIENCE IN AMERICA.

—It would be difficult to overestimate the influence which the rise of the great American Republic has had on the recent phases of political philosophy. Not that the United States has produced a striking literature of the subject. The American spirit is more at home in practice than in theory. It has been the facts of our political history, far more than the literary formulation of our political science, that have produced important results. To the philosophers of Europe, groping blindly about among the rubbish of antiquated systems for a foundation on which to build a strong modern theory of the State, the development of American political institutions was full of suggestions. The Americans themselves worked away at their nation-making quite untroubled, for the most part, by philosophical perplexities. In the crises of attaining their independence the speculative minds among them followed unquestioningly the theories of natural rights and social contract, which were the staple of English and of Continental thought. There was nothing original in the ideas of Otis, Adams, Mason, or Jefferson; only in the application was novelty to be found. In the crisis of constitution-making, the same was true. Hamilton, Madison, and the other leaders in the movement of 1787-80, followed the theories

of Locke and Montesquieu and Burke; but exhibited a marvelous sagacity in distinguishing the features of those theories that were of immediate applicability to the problems at hand, and in rejecting that which, however attractive in philosophy, was not of practical moment.

The reaction of American methods on Europe became manifest at the outbreak of the French Revolution. The formulation in written documents of the rights of subjects and the form and powers of Governments followed American precedents; and the effect of this practise, in classifying thought on political subjects, was enormous. In America itself, speculation in reference to the written Constitution took a narrow legal form. The meaning of the language in this one concrete document absorbed our interest, and we became a race of constitutional lawyers. But beyond the seas the written Constitution, as a new phenomenon in politics, excited debate as to its abstract significance, and as to its importance, not to a particular State, but to the State in general. A new turn was given to the perennial discussion as to the relative position of monarch and people in reference to ultimate political authority. European thinkers, with the concept of a written constitution to work upon, were able to assign to the popular will a much more definite function in the abstract state. Moreover, the progress of an untrammelled democracy on this side of the water attracted the attention of social philosophers. The study of our institutions has been the source of such profound reflections, on both the good and the bad aspects of democratic development, as are to be found in de Tocqueville, in Maine, and in Bryce.

The crisis of our struggle for national unity, culminating in the Civil War, produced a considerable volume of literature, in which a solution for our practical problems was sought in the principles of abstract political theory. Lieber's *Political Ethics*, published before 1840, was the most complete treatise of a broad philosophical character prior to the war; and this work followed very closely the lines of German speculation of the day. Of our great *ante-bellum* statesmen, Calhoun was the most endowed with the spirit of speculation, and his *Disquisition on Government* embodies some very suggestive ideas on the ultimate principles of Government, apart from his peculiar interpretation of the American Constitution. Of the works called forth by the exigencies of reconstruction at the end of the war, Hurd's *Theory of Our National Existence*, Brownson's *American Republic*, and Mulford's *The Nation*, are notable. All of these betray a close dependence on prominent schools of European thought, but all are devoted to adapting the old formulas to the determination of a national sovereignty in the Constitution of the United States. This question of sovereignty in relation to our written constitution, is a characteristic feature in the work of Jameson, *The Constitutional Convention*, and in that of Burgess, published as late as 1891, on *Political Science and Comparative Constitutional Law*.

The definitions and distinctions evolved in these latter works in the conception of sovereignty have denoted a clear advance in political theory, and have been correspondingly influential. A similar line of advance is to be seen in the works of Anson and Dicey on the English Constitution, and these writers, the latter in particular, reveal their indebtedness to American institutions for light in pushing their way. At the same time continental thought, especially since the problem of German national organization was solved, has looked for inspiration and example across the Atlantic. Laband and Jellinek, the leading German publicists, are finding solutions for the problems of constitutional law and politics in the same conceptions of sovereignty that have been developed by American conditions.

In summary, it is not unfair to say that American facts and American theories, together, have given to individual rights their surest present guarantee through written constitutions, and to national authority its surest support through the interpretation of sovereignty in those constitutions.

WM. A. DUNNING.

POLLOCK, SIR FREDERICK, eldest son of Sir William Frederick Pollock, was born in 1845, and educated at Eton and Trinity College, Cambridge. He was called to the bar in 1871 and was examiner in law at Cambridge, 1879-81. He was Professor of Jurisprudence at University College, London, in 1882-83, and then at Oxford. He was Professor of Common Law in the Inns of Court, 1889-90. He is editor of the *Law Quarterly Review*, and of the *Law Reports* since January, 1895. He has published works on law, a history of political science, etc.

POLL TAX. See TAXATION.

POLYANDRY (Gr. *πολῖς*, *many*, and *ἀνὴρ*, *man*) is the social state where the women have more husbands than one. It is sometimes limited to the marriage of a woman to two or more brothers. It has prevailed in savage times more or less all over the world. It still exists in Tibet, Ceylon, and some parts of India. See FAMILY.

POLYGAMY (Gr. *πολῖς*, *many*, and *γάμος*, *marriage*) is the social state where the husband has more than one wife (polygyny), or the wife has more than one husband (polyandry). See POLYANDRY and POLYGyny.

POLYGyny (Gr. *πολῖς*, *many*, and *γυνή*, *woman*) is the social state where the husband has more than one wife. It prevails in most savage lands, and is allowed in some semi-civilized lands. See FAMILY.

POOL-SELLING is the selling of pools or stakes where a combination of persons stake a sum of money on the success of a horse, or on whatever thing the pool may be; the money to be divided among the successful betters according to the amount put in by each. There has been considerable agitation against pool-selling, and laws have been passed against it. See GAMBLING.

POOR-LAWS (ENGLISH).—The poor-laws of England, which have played so large and important a part in her economic and social history, date mainly from the Elizabethan period.

In feudal times the poor were recognized as having direct claim on their lords; there needed to be no other legal provision. What more was needed was left to monastic and other ecclesiastical organizations, and to hospitals. There was no inquiry into the causes of destitution; application for relief was the one thing needful. The inevitable consequence of this want of discrimination was that the very machinery for the relief of the poor became a means of increasing their number and deteriorating their character. The downfall of feudalism and the transition to an industrial and commercial society, too, developed pauperism which differed widely from the poverty of preceding centuries, and completely outgrew the machinery for its relief.

Steps were first taken simply for the repression of the poor. An act of 12 Richard II., after providing for labor for persons able to work (see *Labor and Labor Laws*, vol. xiv. p. 167), enacts "that beggars impotent to serve shall abide in the cities and towns where they may be dwelling at the time of the proclamation of this statute, and, if the people of the cities and towns will not, or may not, suffice to find them, that these, the said beggars, shall draw them to other towns within the hundred, rape, or wapentake, or to the towns where they were born, within 40 days after the proclamation made, and there shall continually abide during their lives." This is the first enactment in which the impotent poor are directly named as a separate class, and on that account it has been mistakenly regarded as the origin of the English poor-laws; but it makes no provision for their relief, and the chief characteristic of the statute is the fact of its having openly recognized the distinction between "beggars able to labor" and "beggars impotent to serve."

Early Legislation.

But the problem grew. The reckless waste of national resources by Henry VIII.; the dissolution and spoliation of the monasteries, and the resultant transfer of land and other property from the possession of semi-popular trustees to nobles greedy for increased rents; the debasement of the currency which raised the cost of the necessities of life, and was not accompanied by a proportionate increase in wages; and the confiscation of the lands belonging to the craft-gilds—all combined to bring about a state of distress and misery among the masses of the people which has persisted, in varying extent and intensity, down to the present day. The Agrarian Revolution of the sixteenth century, by which men were displaced to make room for sheep, and the impoverishment of the small farmers which followed in its train; the discovery of a new world and the consequent birth and development of the "great industry" and the vast foreign commerce of to-day; the continuous enclosure of common lands, and the enforced aggregation of men into the towns, had all also added to the deterioration of the national life, and contributed to establish pauperism as a national institution.

In 1536 Parliament first attempted to cope with the problem by enacting that voluntary alms should be collected in each parish for the purpose of relieving the impotent poor. "Every preacher, parson, vicar, and curate,"

says the act, "as well in their sermons, collections, bidding of the beads as in the time of confession, and making of wills, is to exhort, move, stir, and provoke people to be liberal for the relief of the impotent." But this scheme failed, and was repealed four years later. In 1551 another attempt was made to establish a voluntary poor fund. A book was directed to be kept in every parish, containing the names of the householders and the impotent poor, and in Whitsun week collectors were to be appointed whose duty it was on the following Sunday at church to "gently ask every man and woman what they of their charity will give weekly towards the relief of the poor. . . . If any one able to further this charitable work do obstinately and frowardly refuse to give or do discourage others, the ministers and churchwardens are to gently exhort him. If he will not be so persuaded, the bishop is to send for him to induce and persuade him by charitable ways and means, and so, according to his discretion, take order for the reformation thereof." This act was also ineffective and was repeated word for word in another act.

Passing by various acts of similar import and growing more and more toward the compulsory relief of the poor, we come to the Elizabethan acts. Early in Elizabeth's reign the spiritual persuasion toward obstinate persons withholding contributions was strengthened by the aid of the civil power. A few years later (1572) legislation took a more vigorous turn "for the punishment of vagabonds and for relief of the poor and impotent."

Elizabethan Acts.

The act 14 Eliz. c. 5, reciting that "all the parts of this realm of England and Wales be presently with rogues, vagabonds, and sturdy beggars exceedingly pestered, by means whereof daily happeneth in the same realm horrible murders, thefts, and other great outrages, to the high displeasure of Almighty God, and to the great annoy of the common weal, and for avoiding confusion by reason of numbers of laws concerning the premises standing in force together," repealed before-mentioned statutes and made provision for various matters, "as well for the utter suppressing of the said outrageous enemies to the common weal as for the charitable relieving of the aged and impotent poor people." Persons above 14, and being rogues, vagabonds, or sturdy beggars, and "taken begging in every part of this realm, or taken vagrant, wandering and misordering themselves," were upon their apprehension to be committed to prison to the next sessions or jail delivery without bail, and on conviction "shall be adjudged to be grievously whipped, and burnt through the gristle of the right ear with a hot iron of the compass of an inch about, manifesting his or her roguish kind of life, and his or her punishment received for the same." This judgment was not to be executed if, after imprisonment, "some honest person, valued at the last subsidy next before that time to five pounds in goods or 20s. in lands, or else some such honest householder as by the justices of the peace of the same county, or two of them, shall be allowed, will of his charity take such offender before the same justices into his service for one whole year," under recognizance to keep this poor person for that period and to bring him, if still living, before the justices at the year's end; on the other hand the pauper, departing within the year against the will of his master, was to be whipped and burnt as above provided. The offender was absolved from a second punishment for a short time, but if after threescore days, and being of the age of 18 or more, he "do oftsoons fall again to any kind of roguish or vagabond's trade of life," then the said rogue, vagabond, or sturdy beggar, from thenceforth was "to be taken, adjudged, and deemed in all respects as a felon," and should suffer as a felon—sub-

ject, however, to like redemption as on the first charge, conditioned for two years' service; but offending a third time he was to "be adjudged a felon" and suffer pains of death and loss of lands and goods as a felon, without allowance or benefit of clergy or sanctuary. Offenders under 14 were punishable by whipping or stocking, as provided by the repealed statutes.

This was harsh, but the short-lived law of Edward VI. was harsher still. It allowed, however, for many exceptions, and called for charitable relief.

The numerous charities and endowments and foundations of almshouses, by will and otherwise, of the sixteenth and seventeenth centuries, still extant in numerous buildings throughout the country, are illustrations of the spirit of the legislation here referred to. It is not improbable that legislation sometimes prompted the donations, but more probable that such legislation was a reflex of the general disposition prevalent for generations after the ordinary channels of voluntary charity were obstructed.

Still, legal repression and private charity did not work, and occasioned the legislation of 1601, laying the foundation of the poor-law system which has endured in substance even down to the present century.

By this act two or more "substantial householders" were to be yearly nominated by the justices of the peace to serve as overseers of the poor in each parish. The overseers were to raise "weekly or otherwise, by taxation of every inhabitant, such competent sums of money as they shall think fit," for (a) setting to work the children of all such whose parents shall not be thought able to keep and maintain them; (b) for setting to work all such persons, married and unmarried, having no means to maintain them, and who use no ordinary and daily trade of life to get their living by; (c) for providing a convenient stock of flax, hemp, wool, thread, iron, and other ware and stuff, to set the poor on work; (d) for the necessary relief of the lame, old, impotent, blind, and such other among them being

poor and not able to work. Children whose parents cannot maintain them are to be apprenticed till the age of four-and-twenty years in the case of boys, and twenty-one years or the time of marriage in the case of girls. The overseers may, with the leave of the Lord of the Manor, erect houses for the impotent poor on any waste or common. No provision is made for the erection of any house in which work may be done, and it was evidently intended that the flax, hemp, etc., should be worked up at the houses of the poor. But an act of 1576 had already empowered the justices of each county to erect "houses of correction" in which "such as be already grown up in idleness and so rogues at this present" should be set to work under strict prison discipline; and the justices were now ordered to commit to these places, or to the common jail, those who refused to work on materials provided by the parish. What they had to expect at the houses of correction may be seen from one of the rules of the Suffolk House for the year 1580—"Item, it is ordered and agreed upon that every strong or sturdy rogue at his or her first entrance into the said house shall have 12 stripes upon his bare skin with the said whip provided for the said house; and every young rogue or idle loiterer six stripes with the said whip in form aforesaid. And that every one of them, without fail, at their first coming into the said house, shall have put upon him, her, or them some clogs, chain, collars of iron, ringle, or manacle, such as the keeper of the said house shall think meet."

The new act was only gradually carried out. In 1622 "A Wellwisher" complains, in a tract called, "Grievous Groans for the Poor," that "tho' the number of the poor do daily increase, there hath been no collection for them, no not these seven years, in many parishes of this land, especially in country towns; but many of those parishes turneth forth their poor, yea and their lusty laborers that will not work, or for any misdemeanor want work, to beg, filch, and steal for their maintenance, so that the country is pitifully pestered with them; yea and the maimed soldiers that

have ventured their lives and lost their limbs on our behalf are also thus required. . . . So they are turned forth to travel in idleness (the highway to hell) . . . until the law bring them unto the fearful end of hanging."

In 1630 a royal commission was appointed to examine into the working of the law, and new legislation resulted. In 1662 the statute 13 and 14 Charles II. recited various evils, and developed the law of settlement, which proved so fruitful in ills.

It said "by reason of some defects in the law, poor people are not restrained from going from one parish to another, and therefore do endeavor to settle themselves in those parishes where there is the best stock, the largest commons or wastes to build cottages, and the most woods for them to burn and destroy, and, when they have consumed it, then to another parish, and at last become rogues and vagabonds, to the great discouragement of parishes to provide stocks, where it is liable to be devoured by strangers." Justices of the peace, upon complaint by the parish officers, within 40 days after any such person's coming to settle as before mentioned in any tenement under the yearly value of £10, were empowered by warrant to remove such person to the parish where he was last legally settled either as a native, householder, sojourner, apprentice, or servant for not less than 40 days, unless he gave sufficient security for the discharge of the parish.

Law of Settlement.

This act at once divided England into fourteen thousand warring communities, each determined, at whatever cost to the national welfare, to throw its burden of involuntary charity upon its neighbor. A huge code of case law, developed by hundreds of judgments and appeals, was founded upon the muddled sentences of the original acts. Every possible subtlety as to the effect of every variety of hiring or apprenticeship, or the validity of indentures given by a parish where the churchwardens and overseers were the same persons, was defined to a hair's breadth, while the incurable vagrant, the too ambitious laborer, the widow, the lunatic, the invalid, the miserable causes and instruments of this warfare, were carted and whipped and scorned and driven backward and forward from one cruel little parish to another.

The eighteenth century saw some changes in the law. It had evidently produced evil. By the statute 1 James II. c. 17 (one of the acts continuing the act of Charles II.), it had been enacted that, as poor persons "at their first coming to a parish do commonly conceal themselves," the 40 days' continuance in a parish required by the act of Charles to make a settlement, were to be accounted from the time of the person's delivering a notice in writing of the house of abode and number of the family to the parish officer. Hence persons coming to work under a certificate, on its production, were removed back again, lest they gain a settlement at the end of 40 days. This mischievous result was sought to be avoided by a certificate of acknowledgment of settlement, and then and not before, on becoming chargeable to another parish, the certificated person could be sent back to the parish whence it was brought (8 and 9 Will. III. c. 30). This provision led to additional legislation, complicating the law of settlement. It was not until toward the close of the eighteenth century that an important inroad on the law relating to the removal of the poor was made by requiring actual chargeability before removal to their place of settlement (35 Geo. III. c. 101); and at the same time justices were empowered to suspend removal in the case of sickness.

There was with this some development of relief. In 1676 William III., when appointing his new Board of Trade, instructed them to "consider of proper methods of setting on work and employing the poor, and making them useful." In the same year a Bristol merchant

named John Cary proposed the erection of a workhouse for the united parishes of Bristol. Two years later a new "corporation" was formed for London, and several houses in Bishopsgate Street were bought. Into these houses were taken "the poor distressed children that lay up and down in the streets of the city," and others, for each of whom the churchwardens of the various city parishes paid a shilling a week. There were about four hundred in all. At Bristol, Cary succeeded in getting his workhouse established. The example of Bristol was followed by Plymouth, Worcester, Hull, Exeter, and other places. The results, in suppressing vagrancy and keeping down the rates, were so good that in 1722 a general act was passed allowing parishes either singly or in combination to build workhouses, and to refuse relief to all who would not enter them. At once a very large number of workhouses were erected in many parts of England. Their first effect was shown in a very considerable decrease of the rates.

Those who administered the workhouses were under no illusion as to the cause of this decrease. In a book published in 1725, describing about a hundred of the newly established houses, a correspondent from Rumford writes: "I must, sir, observe to you that the advantage of the workhouse to the parish does not arise from what the people do toward their subsistence, but from the apprehension the poor have of it." The workhouses were run for profit. Sir Matthew Hale, one of the wisest and best men of his time, some time before 1662, advocates the building of workhouses for the employment of the poor. "By this means," he says, "the wealth of the nation will be increased, manufactures advanced, and everybody put into a capacity for eating his own bread." John Locke's report to the Board of Trade, written in 1697, contains exact calculations as to the value of the labors of young children, and of those who, being decayed of their full strength, could yet do something. Even Henry Fielding, with all his experience as a police magistrate and his own practical good sense, suggested in 1753 that the workhouse might be made a place where industrious destitute men might support themselves by the sale of their work; and lesser men than Hale and Locke and Fielding issued, from the middle of the seventeenth till the end of the eighteenth century, a constant succession of pamphlets advocating various schemes for "employing the poor to profit," generally by engaging them in the woolen or linen manufactures.

A few years, however, sufficed to develop the injurious effects of this mode of dealing with the poor, and the accumulated evils of the working of the poor-laws led, in 1783, to the passing of the statute 22 George III., c. 83, known as "Gilbert's Act," the principle of which was extensively adopted in subsequent legislation. Only the aged and infirm were to be sent to workhouses, and the principle was deliberately adopted that work was to be found in the neighborhood for the able-bodied, and that any difference between their wages and the sum necessary for their maintenance

was to be made up from the rates. In 1790 another act was passed, attempting to create a system of inspection of poor-houses by justices and the clergy. But as soon as the French War had begun (1793), the poor-laws began to be administered in a spirit of blind panic. By this time the justices had taken upon themselves most of the responsibility for the amount and character of the relief granted by the parish overseers. It had been originally intended by the poor-law of Elizabeth that they should, through their right of appointing the overseers, exercise a general control over the system, but an act of 1691 had been so interpreted as to give them an unlimited right of ordering relief themselves, in spite of the opposition of the overseers.

In 1795 the magistrates of Berkshire "and other discreet persons," at a meeting held at Speenhamland, near Newbury, announced that they would make an allowance in aid of wages to "all poor and industrious men and their families," raising the household income in each case to a minimum varying with the price of bread. Next year the clauses of the act of 1723 allowing parishes to offer the workhouse test instead of outdoor relief were definitely repealed. And so began the pauperization of the English rural population. Hitherto relief, in theory at least, had been confined to the exceptionally unfortunate. Now the rates were to become part of the normal industrial system; farmers discharged their men in a body, to take them back next day as paupers with part of their wages paid by the parish.

Says Thorold Rogers (*Work and Wages*, chap. xv.):

"I can conceive nothing more cruel, I had almost said more insolent, than to condemn a laborer to the lowest possible wages on which life may be sustained, by an Act of Parliament, interpreted and enforced by an ubiquitous body of magistrates, whose interest it was to screw the pittance down to the lowest conceivable margin, and to inform the stunted recipient that, when he had starved on that during the days of his strength, others must work to maintain him in sickness or old age."

The terrible suffering and demoralization of the English laborer that resulted from the system can to-day be scarcely credited. Under the law, the laborer was guaranteed against starvation, and there was no incentive to work. He could not live except by pauper relief. He cared therefore little about work. It was really the parish that sold his labor. In some parishes the laborers were put up at auction. Sometimes children of either sex were sold to manufacturers in job lots (the manufacturer sometimes contracting to take one insane child for so many healthy ones). Often children of both sexes were given over to gangmasters, who would let them out to farmers, working them in the field by day and lodging them in barns by night without any pretense of decency. The poorhouses were called "bastiles," and hated. The degraded laborer came to look upon pauper relief without shame, and the distributor of the relief would go around and distribute the bread the laborer could not buy. The poor-relief rates rose till they threatened to devour the rents of the landlords. The landlords themselves were

**Pauperizing
Labor.**

compelled to desire a change. Various minor changes led to the great reform law of 1834.

Says Graham Wallas (see references at the end of this article):

“Political economy’ had by this time consolidated itself in the writings of Ricardo, and MacCulloch, and James Mill. Malthus had demonstrated the important part which the struggle for life had played in the history of human society as well as in the animal world. No member of Parliament could now repeat without criticism the light-hearted argument of Mr. Charles Gray in 1751, that the poor-law ‘makes young laborious people venture to marry when nothing else would, and helps to propagate a race of the most useful subjects we have.’ The old ideas as to the profitable employment of the poor scarcely appear in the reports of the Commons committees of 1824 and 1828, and having been rediscovered, without a suspicion of their past history, by Robert Owen in 1812, were now associated in men’s minds with revolutionary schemes of equality.

“At the same time the new doctrine, that human society is best managed when no man is either hindered or helped in supporting himself and his family, seemed to be justified by actual experience in poor-law administration.

“In the parish of Southwell, near Nottingham, the rates had already been enormously reduced by the building of a prison-like workhouse and the exaction of labor, useless, perhaps, but severe and unpaid, as a condition of bare subsistence. Similar experiments, with the same success, had been tried in several other parishes.

“The ‘laws of political economy’ were vaguely felt to have established themselves in a position of gloomy orthodoxy, and when in 1832, during a lull in the fierce struggle for the Reform Bill, the Whigs in power appointed a

Law of 1834. Royal Commission on the poor-laws, its strongest members were known and ardent partizans of the newly accepted science. Their report, after two years of incessant labor on the part of the commissioners and their paid assistants, was presented in 1834, and is still the most magnificent State paper in existence, admirable in form and crushing in argument. It ended by recommending a radical alteration of the whole system. Parishes were to be formed, with or without their consent, into unions, whose accounts were to be inspected and whose by-laws were to be drawn up by a body of three commissioners sitting in London, and represented by traveling subcommissioners in the country. Outdoor relief to able-bodied persons was to be prohibited. Finally, and chiefly, the whole administration of the law was to be regulated on the principle that ‘the condition of the paupers shall in no case be so eligible as the condition of persons of the lowest class, subsisting on the fruits of their own industry.’”

The report was adopted, almost unchanged, by overwhelming majorities. Repression of the poor was now the order of the day. Outdoor relief was gradually ended. Families were broken up, lodged in poorhouses, husband and wife being separated. It produced its hardships. Says Mr. Wallas:

“The sordid abominations of the old law were soon forgotten, and the religious working man as well as the revolutionary Chartist loathed the new science which aimed, it was said, at reducing the population to Parson Malthus’ standard by starving the paupers and separating man and wife in direct defiance of the word of God. Meanwhile the rates, in spite of the new law, were creeping up to the old level, and that great rise in agricultural wages for which the more sincere of the political economists had hoped did not take place. Freedom of combination was the first condition of such a rise, and on the very night after the new poor-law was introduced, Lord Howick repeated the refusal of the Whig Cabinet to interfere with that flagrant sentence of transportation upon the Dorchester laborers which made combinations in agriculture impossible.

“The opposition to the new law soon penetrated to the House of Commons, and it was with increasing difficulty that the powers of the commissioners were from time to time renewed. At last, in 1847, the Poor-law Commission was dissolved, two out of the three worthy gentlemen of the day disappeared, having per-

haps taken themselves rather too seriously as solitary protesters against an evil world, and an official Poor-law Board with a parliamentary head was created. By 1871 so many duties of various kinds had been assigned to the department that it took the name of the Local Government Board, which it still retains. Sixty years have now passed since the new poor-law was first enacted. During that time the great evil noted by the commissioners of 1834, the relief of able-bodied men in aid of wages or as a premium upon idleness, has practically disappeared. Of the 728,042 persons in receipt of relief on the 1st of July, 1891, there were only 3641 adult men in good health receiving indoor and 3419 outdoor relief—these last being helped only in some urgent crisis. There were at the same time not more than 6351 women in health inside the workhouses, and 52,679, almost all of whom were widows, receiving relief outside. Our pauper population now consists of deserted or orphan children, helpless old men and women, invalids, and lunatics. Their number has remained wonderfully steady for the last twenty years, tho it does not at present increase with the increasing population. But the amount spent in their relief does slowly increase, and there is no sign of that extinction of the poor-rates to which most political economists in the early part of the century looked for as a result of good administration.”

Relief is now given under a series of general orders and instructional circulars issued by the Local Government Board and its predecessor, the Poor-law Board. While local guardians are not supposed to act contrary to these regulations, they have considerable latitude in administration. The regulations provide that no relief shall be given to any able-bodied male person while he is employed for wages or any remuneration, and that every able-bodied male relieved out of the workhouse shall be set to work, and be kept employed so long as he continues to receive relief. The exceptions to these rules are:

Present Methods.

Cases of sudden and urgent necessity, defined as “destitution requiring instant, but not permanent, relief”; cases of sickness, accident, or bodily or mental infirmity; burial expenses; widows within the first six months of widowhood; widows with legitimate child or children dependent on them and incapable of earning their livelihood, and with no illegitimate child born after the commencement of widowhood; wives and children of soldiers, sailors, marines, or militiamen, or of prisoners or convicts; wives and children of not able-bodied persons not residing in the parish.

Outdoor relief is given in money and in kind, but in the case of able-bodied persons it is laid down that “one-half at least shall be given in articles of food or fuel or in other articles of absolute necessity.” Relief may also be given by way of loan. The relieving officer has to investigate the cases of all applicants; he can give temporary relief in kind, where necessary, and must report to the guardians as to the health, ability to work, etc., of the applicant and his family. The guardians are then to decide on the merits of each individual case.

Indoor relief is administered under a general order issued in July, 1847.

Of the working of the law, Mr. J. F. Oakeshot (see references) says:

“The growth of humanitarian feeling has had its influence on Poor-law administration, and the inhumanity of 50 years ago would not be tolerated by public opinion to-day. At the same time the administration of the law is still wanting in humanity. Over the entrance of Dante’s Hell was written, ‘Abandon hope, all ye who enter here,’ and if the effect of our Poor-law system were to be summed up in a single sentence we should have to use the same words. In

the desire of insuring that 'the situation of the paupers shall not be made really or apparently so eligible as the situation of the independent laborer of the lowest class,' we deliberately feed them worse than criminals (the prison dietary is luxurious in comparison with the poor-law standard), and we allow the law to be administered with such harshness that many men and women every year deliberately prefer death by starvation outside the workhouse to accepting relief from the rates with its deprivation of the privileges of citizenship and its dishonorable stigma of pauperism alike on aged and young, infirm and able-bodied, deserving and undeserving. Mr. Charles Booth in his recently published work, *The Aged Poor in England and Wales*, states that 'as regards entering the workhouse, it is the one point on which no difference of opinion exists among the poor. The aversion to the "house" is absolutely universal, and almost any amount of suffering and privation will be endured by people rather than go into it.' A recent return ordered by the House of Commons (C-476) shows that in London alone, in 1892, no less than 31 persons, of whom 12 were 50 years old and upward, were certified by the verdicts of coroners' juries to have died of starvation. In no case could any application for relief be traced; and they were never discovered to be in want by the relieving officers, or by any charitable society or individual. Who can say how many times 31 would have to be multiplied if a similar return were made for the whole country, and if we included all those whose deaths were accelerated by starvation, but which were declared by juries to have been due to 'natural causes.'"

Mr. Robert Treat Paine (see references) says of the poor-law of 1834:

"The fundamental principle of this reform was 'That the situation of the person receiving relief should not on the whole be made really or apparently so eligible as the situation of the independent laborer of the lowest class.'

"This principle has been everywhere accepted. . . .
 "In fact the soundness of this principle is unquestioned. The lot of the pauper must not be made too attractive. Yet I am led to ask whether repression has not been guilty of a fatal error. Has not the system been left to such mere officialism as to be hard and depressing, and at last brutalizing?

"And this in two directions. First, to the worthy poor, so that all England is now vibrating in recoil from the sad lot of the old and worthy and suffering poor. Second, to the idle, the dissolute, the loafer, and the tramp—the unworthy poor.

"Do not present conditions in London and New York force us to face a new and graver problem? Yes, and the conditions in cities of the second rank also.

"Do not the new race of brutally degraded paupers laugh to scorn the principle of the English Reform of 1834, that their lot shall not be made too attractive? Do they not defy differences of detail of poor-law administration?

"Has not the principle of repression miserably failed, when its effort to make the lot of the pauper not over-eligible hardens tramps into such brutal degradation that in their game with society they seem just now to hold in their hands the winning cards, and yet on the other hand the worthy poor of England are in such straits that a great pension scheme throws its baleful shadow across the land? . . . Who will not agree with me that *repressive charity alone is hard* and that negative measures alone will fail? . . .

"The conviction that the lot of the poor in England is too hard and their treatment under the poor-law too severe has caused such reaction that a pension scheme of \$85,000,000 a year hangs in the air, and a royal commission has been created to consider the condition of the poor."

For proposed reforms in the poor-law and methods of dealing with the whole problem, see POVERTY.

POPULATION.—(See also BIRTH- AND DEATH-RATE; DEATH-RATE; MARRIAGE; CITIES, MALTHUSIANISM.) We give in this article the principal sociological facts of population, leaving the discussion of the problems involved to the above articles.

I. POPULATION OF THE WORLD.

According to the estimate made by Ernest George Ravenstein, F. R. G. S., for 1890, the population of the earth by continents is as follows:

CONTINENTAL DIVISIONS.	Area in Square Miles.	INHABITANTS.	
		Number.	Per Sq. Mile.
Africa	11,514,000	127,000,000	11.0
America, N.	6,446,000	89,250,000	13.8
America, S.	6,837,000	36,420,000	5.3
Asia	14,710,000	850,000,000	57.7
Australasia	3,288,000	4,730,000	1.4
Europe	3,555,000	380,200,000	106.9
Polar Reg.	4,888,800	300,000	0.7
Total	51,238,800	1,487,900,000	29.0

From *Proceedings of the Royal Geographical Society* for January, 1891.

Some recent authorities, however, put the earth's population at nearer 1,700,000,000. The density of population of the more civilized countries, in the order of density, is as follows:

	Population.	Density per Square Mile.
Belgium	6,993,798	536
Holland	4,558,094	357
Great Britain and Ireland	37,888,152	321
Italy	30,158,408	272
Germany	49,424,135	235
Switzerland	2,933,335	186
France	38,218,903	183
Austria-Hungary	41,284,966	171
Denmark	2,172,205	148
Portugal	4,306,554	124
Servia	2,157,447	116
Rumania	5,000,000	98
Spain	17,246,688	90
Greece	2,217,000	88
European Turkey	5,600,000	83
European Russia	93,703,331	49
Sweden	4,774,409	28
United States	62,622,250	21
Norway	1,999,176	15
Australia	3,230,000	1
UNITED STATES:		
North Atlantic Division	107.37
South Atlantic Division	32.08
North Central Division	29.68
South Central Division	18.94
Western Division	2.58

Ravenstein's estimate of the earth's fertile regions, in square miles, is 28,269,200; steppe, 13,901,000; desert, 4,180,000; polar region, 4,888,800.

The population of the earth according to race, as estimated by John Bartholomew, F.R.G.S., Edinburgh, is:

RACE.	Location.	Number.
Indo-Germanic or Aryan.....	Europe, Persia, etc..	545,500,000
Mongolian or Turanian.....	Greater part of Asia	630,000,000
Semitic or Hamitic	North Africa, Arabia	65,000,000
Negro and Bantu..	Central Africa	150,000,000
Hottentot and Bushmen.....	South Africa.....	150,000
Malay and Polynesian.....	Australasia..... and Polynesia.....	35,000,000
American Indian...	North and South America.....	15,000,000
Total.....		1,440,650,000

The numbers in the world according to creed, as estimated by M. Fournier de Flaix (American Statistical Association Publications, 1892-93, p. 37) are as follows :

CREEDS.	Number of Followers.
1. Christianity.....	477,080,158
2. Worship of Ancestors and Confucianism.....	256,000,000
3. Hinduism.....	190,000,000
4. Mohammedanism.....	176,834,372
5. Buddhism.....	147,900,000
6. Taoism.....	43,000,000
7. Shintoism.....	14,000,000
8. Judaism.....	7,056,000
9. Polytheism.....	117,681,669

Mulhall's estimate of the number speaking the different European languages is :

LANGUAGES.	NUMBER OF PERSONS SPOKEN BY.		PROPORTION OF THE WHOLE.	
	1801.	1890.	1801.	1890.
English.....	20,520,000	111,100,000	12.7	27.7
French.....	31,450,000	51,200,000	19.4	12.7
German.....	33,320,000	75,200,000	18.7	18.7
Italian.....	15,070,000	33,400,000	9.3	8.3
Spanish.....	26,190,000	42,800,000	16.2	10.7
Portuguese...	7,480,000	13,000,000	4.7	3.2
Russian.....	30,770,000	75,000,000	19.0	18.7
Total.....	161,800,000	401,700,000	100.0	100.0

CHRISTIANITY.	
CHURCHES.	Total.
Catholic Church.....	230,866,533
Protestant Churches.....	143,237,625
Orthodox Greek Church.....	98,016,000
Church of Abyssinia.....	3,000,000
Coptic Church.....	120,000
Armenian Church.....	1,690,000
Nestorians.....	80,000
Jacobites.....	70,000
477,080,158	

RELIGIOUS DIVISIONS OF EUROPE.

COUNTRIES.	Catholic Church.	Protestant Churches.	Orthodox Churches (Greek).	Jews.	Mohammedans.	Unclassified
Russia.....	9,600,000	3,400,000	73,310,000	3,400,000	3,000,000	290,000
Germany.....	17,100,000	29,478,000	590,000	32,000
Austria-Hungary.....	31,100,000	3,900,000	3,100,000	1,700,000	100,000
France.....	35,387,000	580,000	40,000	84,000

* New York State census of 1892. The population of the territory embraced within the limits of "Greater New York" as proposed by the commission is about 3,100,000. This will constitute the New York of the immediate future the second city of the world.

Concerning the population by sex, Professor Mayo-Smith (*Statistics and Sociology*, p. 39) tells us that Europe has 1064 and the United States 952 females for every 1000 males. Italy, Servia, and Greece have more males than females; in all other European countries females are in excess, varying from Norway, with 1091; Scotland, with 1072; Sweden, with 1065; England and Wales, with 1064, to Belgium, with 1005, and France, with 1014. Switzerland has 1057; Germany, 1039; Ireland, 1029. In Europe, however, more males are born than females; but the male mortality is also greater. In cities the excess of females is usually greater. The demand for servant girls and saleswomen is far more in the cities than in the country.

Prostitution attracts some. In Asia, Africa, and Australasia males are generally considered to be in excess.

As to age, in England, 23.9 per cent. of the population are under 10 years of age; 21.3 between the years of 10 and 20; 47.3 between 20 and 60; 7.5 over 60 years. The corresponding figures for Scotland are: 24.3 under 10; 21.6 between 10 and 20; 46.2 between 20 and 60; 7.9 over 60. For Ireland they are: 20.8 under 10; 23.4 between 10 and 20; 45.3 between 20 and 60; 10.5 over 60. For France, 17.5 under 10; 17.4 between 10 and 20; 52.5 between 20 and 60; 12.6 over 60. For Germany, 24.2 under 10; 20.7 between 10 and 20; 47.1 between 20 and 60; 8.0 over 60.

II. STATISTICS FOR THE UNITED STATES.

The following table, giving the voting, school, and militia ages, was compiled from the Reports of the Census of 1890 by the *World Almanac*:

STATES AND TERRITORIES.	VOTING AGES—MALES 21 YEARS AND OVER.					PERCENTAGE.		SCHOOL AGES. Total population, 5 to 20 years old.	MILITIA AGES. Total Population, Males, 18 to 44.
	Total.	Native-born.	Foreign-born.	Whites.	Colored.	PERCENTAGE.			
						Native.	Foreign.

* North Dakota.

† South Dakota.

‡ Including 5338 persons in Greer County (in Indian Territory) claimed by Texas.

§ Includes 5328 persons on public ships in the service of the United States not credited to any State or Territory.

|| Includes 6100 persons on public ships in the service of the United States not credited to any State or Territory.

NOTE 1.—According to the census the population of Alaska for 1880 was 33,426, and for 1890, 32,052, of which latter 4298 are white, 23,531 Indian, 2288 Mongolian, 1823 mixed blood, and 112, all other persons.

NOTE 2.—According to the census of 1890 the population of Indian Territory was as follows: Five-Tribe Indian (Cherokees, Creeks, Seminoles, Choctaws, and Chickasaws), 45,494; other Indians, 4561; total Indians, 50,055. Colored and Five-Tribes colored citizen claimants, 18,636; Chinese, 13; whites, including some Indian citizen claimants, 109,384; unknown, 9; Quapaw Indian Agency, 1224; total, 179,321.

NOTE 3.—The total population returned by the Indian census enumerators was 325,464. This included 189,349 reservation Indians and other Indians not taxed, 109,384 whites and 18,636 colored persons, 13 Chinese, and 9 unknown in Indian Territory, and 8073 whites, employees and others, on reservations and at posts.

NOTE 4.—The total number of Indians in the United States, exclusive of Alaska, on June 1, 1890, was 248,155, divided as follows:

Reservation Indians and other Indians not taxed.....	189,349
Taxed Indians counted in the general census.....	58,806
Total.....	248,155

The following tables, giving the constituent elements of the population of the United States, are compiled from the compendium of the eleventh census (1890):

* Includes all persons of negro descent.

For a discussion of the principles involved in these tables, see MARRIAGE; also DIVORCE. Some of the facts, however, speak for themselves. That there should be more than twice as many widowed females as males, and considerably more divorced women than men, indicates unquestionably that men remarry more frequently than women. That in the

United States, the North Atlantic, and North Central States, the average number of persons to a family has steadily decreased during the last two decades, and that in the South and West it has slightly increased, is another significant fact. For the facts as to the increase or decrease of marriages and divorces in the United States, see those articles.

POSTAL SAVINGS-BANKS are savings-banks (*q. v.*) conducted in connection with post-offices and under the management of the State. The United States and Germany, alone among the great civilized countries of the world, do not have postal savings-banks.

The establishment of post-office savings-banks was first effectually mooted in England in 1860 by Mr. C. W. Sykes of Huddersfield, whose suggestion was cordially received by Mr. Gladstone, then chancellor of the exchequer.

A bill—entitled “An Act to grant additional facilities for depositing small savings at interest, with the security of Government for the due repayment thereof”—received the royal assent on the 17th of May, 1861, and was brought into operation on the 16th of September. The banks first opened were situated in places theretofore unprovided with private savings-banks. Within two years nearly all the money-order offices of the United Kingdom became savings-banks; about 367,000 new deposit accounts were opened, repre-

senting an aggregate payment of £4,702,000, including a sum of more than £500,000 transferred from trustee savings-banks, the accounts of which were closed.

In 1891, on a single day, there were as many as 72,869 persons making deposits, who laid by in one day \$790,110. The daily average number of deposits was 29,412, and the average amount of deposits each day was \$350,900. During the year there were 992,155 new accounts opened. The total number of persons in the United Kingdom using the privilege is over 5,000,000.

An interesting department of the English postal savings-banks is thus described in a recent report of the British office :

"It will be remembered that on the 1st of September last an act came into operation which relieved parents from the obligation of paying fees for the education of their children in elementary schools, and that the deficiency thereby caused in the income of the various schools is now made good by grants from the public exchequer, representing in the aggregate over £2,000,000 per annum. It was desired by the Government that strenuous efforts should be made to divert into the savings-banks some portion, at least, of this large sum, and that parents should be induced to train their children at the earliest age to take advantage of the various opportunities for thrift offered by the post-office. Accordingly . . . on the day on which school pence used formerly to be paid the manager receives the pence brought by the children and gives in exchange a corresponding amount of stamps affixed to slips, which the children take home to their parents as evidence of the transaction. At certain intervals these slips are collected, and a clerk from the nearest post-office attends at the school for the purpose of opening accounts and receiving further deposits in the individual names of the children. About 1400 schools adopted the scheme, and others are added daily. It is estimated that the school children had within three months deposited a sum of about £14,000, and it is anticipated that savings of over £60,000 will have been received by the end of the year."

Steps have been taken, too, to interest railway employees in a similar plan. In the Colonies, too, it has had great success. In India, as in England, the use of the postal savings-banks has extended the opportunity of thrift into many parts of the country where, otherwise, it would be impossible to afford such accommodation without incurring a cost too great to be borne by the business of the district.

One of the minor advantages of the system is that it gives the Government a sum to be borrowed in case of necessity, as the cheapest and most popular form of loan.

IN ENGLAND.

The principal features of the regulations governing the service are as follows :

Postal savings-bank offices are open for the receipt and payment of money daily.

At these offices ordinary deposits of one shilling, or any number of shillings, will be received, subject to the limits of £30 in one year, ending December 31, and £200 in all, inclusive of interest. A depositor may, not more than once in any savings-bank year, deposit money to replace money previously withdrawn in one entire sum during that year. In addition, deposits will be received for immediate investment in government stock, and in connection with government insurance and annuities.

Any person desirous of saving one shilling by means of penny contributions for deposit in the postal savings-bank may do so by purchasing with any penny so saved a penny stamp, and affixing it to a form to be obtained at any post-office. Instructions as to this form are printed thereon.

On opening an account a person must state his Christian name or names and surname, occupation, and residence. He must also sign a declaration to the effect that he takes no benefit from any savings-bank account, unless it be as personal representative of a deceased depositor, or as a member of a friendly society. If such declaration, or any part thereof, is not true, the deposits will be liable to forfeiture.

Every deposit must be entered at the time in the de-

positor's book by the postmaster, or other person receiving it, who must affix to the entry his signature and the stamp of his office.

In addition to the receipt in the book, the depositor will receive an acknowledgment by post from the savings-bank department in London.

Interest at the rate of £2 10s. per cent. per annum, which is at the rate of 6d. a year, or 1/2d. a calendar month for each complete pound) is allowed until the sum due to a depositor amounts to £200. When the balance declared on ordinary account, inclusive of accumulated interest and dividend, exceeds £200, no interest is allowed on the amount in excess of £200. The calculation of interest is made from the first day of the calendar month next following the day on which a pound has been deposited or completed, up to the last day of the calendar month preceding the day on which a warrant for repayment is issued; and after each 31st day of December the interest is added to the principal.

When a depositor wishes to make a withdrawal from his account, he should fill up and forward to the savings-bank department a notice of withdrawal, which he can obtain at any postal savings-bank office. He will then receive by post a warrant, which he should present, together with his book, at the post-office where payment is to be made, and the postmaster will take from the depositor a receipt on the warrant.

IN FRANCE.

Of all the departments of the Government the post-office is the one which is known best, and whose services are most highly appreciated.

Private savings-banks can, in the majority of cases, only have their windows open for deposits and payments for two or three hours per week. The 7000 post-offices, however, which are branches of the postal savings-banks, are open every day, including Sundays and holidays, and during the greater part of the day.

The public can draw money and pay money at every post-office, and can draw at one post-office money deposited in another.

Besides these highly appreciated facilities, the direct management of the postal savings-bank by the Government, represented by the administration of posts, offers absolute security to depositors.

By reason of these facilities and this security the postal savings-bank has been enabled to prosper and develop, altho it only pays 3 per cent. interest; a lower rate than that paid by private savings-banks, which existed before the establishment of the postal savings-bank, and which still exist.

Even communes where there is no post-office, and, therefore, no agency of the savings-bank, are visited at least once a day by the rural letter-carriers, who can serve as intermediaries between the post-offices and the depositors for making deposits. It may, therefore, be said that there is not a commune and not a hamlet in France where savings cannot be collected.

These statistics are taken for the latest years from the *Statesman's Year Book* for 1895, and for the earlier years from Mr. Wanamaker's investigation of the subject, described in his report as postmaster-general in 1892. They show that, in Europe alone, over 12,000,000 of people use the postal savings-banks and deposit some \$420,000,000 a year. Remembering those who use this system in Australia, India, and other colonies it is small wonder that Mr. Wanamaker recommended that the United States should adopt the system and that several bills to that effect are now pending in Congress.

See Report of the Postmaster-General for 1892.

POSTAL SERVICE.—I. HISTORY. The earliest postal service of the world was probably that of the trained runners or couriers who carried official and military messages between the cities of Greece and Rome, developing into the heralds and nuncios and embassies between governments in later times.

At first they carried simply official messages. Gradually they came to carry private messages. Then all letters of the fifteenth and perhaps the fourteenth century in England evidently were carried by a system of messengers. The University of Paris organized a system of messengers in the thirteenth century. Sir Brian Tuke, in 1533, is described as Master of the Messengers.

History.

In 1635 Thomas Witherings was authorized to run a post night and day between London and Edinburgh, "to go thither and back again in six days." Eight lines of post were established. The postage was *ad* for less than 80 miles, *8d.* to any place in Scotland. In 1685 a penny post was established in London and suburbs. It was a private speculation, but, on succeeding, was annexed to the Crown. In 1783 mail-coaches were substituted for boys on horseback. In 1837 Rowland Hill published a pamphlet, analyzing the postal system and showing £282,308 as the probable outgoings for receipt and delivery and £144,209 as the probable outgoings for transit. In other words, the expenditure which hinged upon the *distance* the letters had to be conveyed was £144,000, and that which had nothing to do with distance was £282,000. Applying to these figures the estimated number of letters and newspapers (126,000,000) passing through the office, there resulted a probable average cost of $\frac{3}{8}$ of a penny for each, of which $\frac{1}{8}$ was cost of transit and $\frac{2}{8}$ cost of receipt, delivery, etc. Taking into account, however, the much greater weight of newspaper and franked letters as compared with chargeable letters, the apparent average cost of *transit* became, by this estimate, but about $\frac{1}{10}$, or less than $\frac{1}{10}$ of a penny.

From this Hill argued that as it would take a nine-fold weight to make the expense of transit amount to one farthing; he further inferred that, taxation apart, the charge ought to be precisely the same for every packet of moderate weight, without reference to the number of its enclosures.

Parliament was induced to appoint a committee, which sustained Mr. Hill and showed that postage was extensively evaded by all classes of society, correspondence suppressed, more especially among the middle and working classes of the people, and thus,

in consequence, the cost unnecessarily high. As a result, Rowland Hill was placed in charge. A bill was passed, enabling reforms to be put into effect. A penny was adopted as the uniform rate for every inland letter not above half an ounce. Facilities for prepayment were afforded by the introduction of postage-stamps, and double postage was levied on letters not prepaid. Arrangements were made for the registration of letters; and the money-order office, by a reduction of the commission charged for orders, became available to an extent which it had never been before.

As far back as 1792 a money-order office had been established as a medium for sailors and soldiers to transmit their savings, and its benefit had afterward been extended to the general public; but the commission charged had been so high that it was only employed to a very limited extent. The immediate result of the changes introduced in 1840 was an enormous increase in the amount of correspondence, arising in part from the cessation of the illicit traffic in letters, which had so largely prevailed before; but

for some years there was a deficit in the post-office revenue.

With the development of the railway system came the carriage of letters by train, adding to the expenses of the post-office, but gradually the former gross revenue of the post-office was exceeded in 1851, and the net revenue in 1863. Many reforms were introduced: (1) The establishment of postal savings-banks (1861); (2) the transfer to the State of the telegraphic service (1870); (3) the introduction of postal cards (October, 1870); and (4) the establishment (1883) of a parcel post.

The French postal system was founded by Louis XI. (1464). In 1627 France originated a postal money-transmission system. Mazarin's edict of 3d December, 1643, shows that France at that date had a parcel post as well as a letter post. Important postal reforms in France are: The extension of postal facilities to all the communes of the country; the adoption of postage stamps (1840); the organization of an excellent system of not only transmitting but insuring articles of declared value, whatever their nature (1850); the issue of postal notes payable to bearer (1860); the establishment of a post-office library (1878); the creation of postal savings-banks (1880).

The German postal system also began early. In Strasburg a messenger code existed as early as 1443. A postal service was organized at Nuremberg in 1570.

The Prussian system began with the Great Elector, and with the establishment, in 1646, of a government post from Cleves to Memel. Frederick II. largely extended it. The first mail steam-packet was built in 1821; the first transmission of mails by railway was in 1847; the beginning of the postal administration of the telegraphs was in 1849; and, by the treaty of postal union with Austria, the germ was virtually set of the International Postal Union.

The first postal service established in any portion of what is now the United States was probably made by the General Court of Massachusetts in 1639.

In 1672 the government of the Colony of New York established a "post to goe monthly from New York to Boston"; and notice was given to "those that bee disposed to send letters, to bring them to the secretary's office, where in a lockt box they shall bee preserved till the messenger calls for them, all persons paying the post before the bagg bee sealed up."

In 1692 the English Government put the colonial postal service in charge of a deputy postmaster-general, and in 1710, by formal act of Parliament (9 Queen Anne, chap. x.), the first organized system for the transmission of the mails in the Colonies was created.

In 1753 Benjamin Franklin, who had been postmaster at Philadelphia, was made postmaster-general. A penny post was established at Philadelphia; in 1756 the first stage, probably, in the Colonies began to carry the mails between Philadelphia and New York. In 1758 newspapers,

which previously had been carried in the mails free, were charged with postage. Other reforms and improvements were begun, so that in 1774, the last of Franklin's administration under the Crown, the net revenue of the postal service was over £3000. On January 30 of that year Franklin was removed from office, as he himself calls it, "by a freak of the ministers," due to his pronounced advocacy of the cause of the Colonies; but in July, 1775, he was appointed, by the Second Continental Congress, "Postmaster-General of the United Colonies." When the Constitution

England.

Cheap
Postage.

went into operation, Congress, by act of September 22, 1789, provided for the "temporary establishment of the post-office," the regulations to be "the same as they last were under the resolutions and ordinances of the late Congress."

In 1792 an act was passed to establish a general post-office.

So insignificant was this department that in 1790 Samuel Osgood, in a letter to Alexander Hamilton, gravely discussed the question whether the Postmaster-General should not be required to occupy the room at the seat of government where the mails were received and dispatched, in order that he might personally superintend the work.

But the service rapidly grew. In 1816 better rates were granted. In 1834 railroads were first used. In 1851 a great advance was made toward cheap postage. Letters not over one-half ounce, prepaid, could be sent 3000 miles for three cents. In 1855 the registry system was authorized; in 1863 the free delivery system; in 1864 the money order system; in 1885 the special delivery. Other reforms have been the introduction of railway post-offices and, very recently, electric street postal cars; the system of delivery, postal cards, and return cards, etc., etc.

In 1874 a Universal Postal Union was formed, mainly owing to the efforts of Dr. von Stephan of Germany, tho it had been proposed to the various countries by the United States in 1862.

Universal Postal Union.

The approximate number of letters and postal cards transmitted annually in the mails of European countries is as follows: Great Britain and Ire-

land, 1,500,000,000; Germany, 1,200,000,000; France, 700,000,000; Austria-Hungary, 600,000,000; Italy, 250,000,000; Russia, 200,000,000; Belgium, 130,000,000; Spain, 120,000,000; Switzerland, 110,000,000; Netherlands, 100,000,000; Sweden, 100,000,000.

The number of pieces of postal matter of all kinds which pass through the mails of the United States annually is about 3,800,000,000. The annual aggregate number of letters transmitted through the post-offices of the world may be estimated at 8,000,000,000, and of newspapers, 5,000,000,000.

The United States transmits 71 pieces of mail per capita to its population; Great Britain, 61; Germany, 41, France, 37.

The main expenses of the department in 1894 were railroad transportation (\$25,661,567), payment of postmasters (\$15,889,700), free delivery service (\$11,239,251), clubs (\$8,759,386), railway clubs (\$6,878,194), star routes (contract routes) (\$5,806,855), railway postal car service (\$2,921,957), mail messenger service (\$1,208,972), foreign mails (\$1,250,154).

Expenses.

The Postmaster-Generals assert the cause of the deficiency in the department is that so much matter for other departments is carried free. The report for 1894 says (p. 4): "If the free business transacted by this department for the other departments of the Government were paid at regular rates, as has at times been suggested, the post-office department would be self-sustaining." Says Mr. Wanamaker in his Report (1893): "Bundles of wire six feet high, and six feet around, bags of seeds, supplies for the army, tons of documents packed in wooden cases that sometimes require three men to handle them, millions of blanks of the census office, are piled into the post-offices.

Cause of Deficiency.

The reason for it is, that the Post-Office Department is compelled to carry anything sent under a penalty frank, and finally franks are used by all the departments and their agents for the purpose of carrying everything they choose to send."

II. STATISTICS.

The following data for the United States are taken from the annual reports of the Postmaster-General:

Year Ending June 30	Post-Offices.	Extent of Post-routes.	Revenue of the Department.	Railway Mail Service.		Total Expenditure of the Department.
				Number of Employees.	Annual Expenditure.

Mr. Bissell in his Report for 1894 says, that the one great, and in his opinion unnecessary loss of revenue to the department arises from the undue amount of mail matter transmitted at second-class rates (one cent a pound). The 256,000,000 pounds of this matter carried in 1893, added to the 44,000,000 carried free, was, he says, about two-thirds of the weight of the mails. He says this rate is abused to carry trashy serials, advertising sheets, bogus papers, sample copies, etc., etc. He recommends the careful modification of this law, to distinguish between real journals and publications and advertising sheets, etc. (But see below.)

July 1, 1893, there were 610 free delivery offices. July 1, 1894, there were 10,264 domestic money-order offices, which transmitted, the 12 months previous, \$138,793,579. There were 2625 international money-order offices which transmitted abroad \$13,792,455, and received \$6,568,493. There were issued 7,765,310 postal notes valued at \$1,640,094. The gross revenue received from the money-order business was \$960,347. The number of pieces of mail matter received at the dead letter office was 7,101,044, of which 2,975,998 were restored to their owners containing money or notes, exclusive of merchandise valued at \$1,000,663. The sale of stamps, cards, etc., was \$70,239,910 in value. There were mailed at pound rates, papers and periodicals aggregating 254,799,306 pounds; 44,962,995 pounds of matter were carried free. There were mailed 2,383,730,000 letters; 468,490,000 postal cards; 1,429,450,000 pieces of second-class matter; 589,180,000 pieces third-class; 48,240,000 fourth-class; 23,166 post-office appointments were made, 1028 being Presidential post-office appointments; 351 post-office burglars were arrested; 1621 offices were burglarized during the year; 558 offices burned; 50 postal cars burned and wrecked; 48 mail trains and stages robbed; 5926 complaints were received concerning registered mail, and 56,877 concerning unregistered; of 41,419 cases investigated, no loss occurred in 6731 cases, leaving 56,072 with a claimed loss—this is less than one complaint for 87,000 pieces carried; 29,614 employees were on the civil service list.

Miscellaneous Statistics.

The employees of the Post-office are expected to work eight hours a day besides what Sunday work is necessary. Overtime is paid for, though too often the employees have to contest for such pay. Their wages are \$600, \$800, \$850 and \$1000, according to the time they have worked in the department. The number of postmasters is about 67,368; clerks, 111,875; letter carriers, 10,892; sub-contractors, 11,478; mail messengers and railway postal clerks, 13,762. (*The Story of Our Post Office.*)

The number of post-offices in the United Kingdom, March, 1834, was 20,016. The staff of officers was 74,819 (10,908 women), besides 61,000 who did not hold permanent positions. There were delivered the year ending March 31, 1894, 1,812,000,000 letters; 248,500,000 post cards; 574,300,000 book packages; 164,900,000 newspapers; 547,000,000 parcels; 10,524,774 money orders valued at £28,720,820. The revenue exclusive of the postal telegraph was £10,472,875; the expenses, £7,738,602. There are 46 miles of pneumatic tubing in London.

(See also POSTAL SAVINGS BANKS and TELEGRAPH.)

Great Britain.

III. POSTAL REFORMS.—In his report for 1892 Mr. Wanamaker outlines his ideal postal system:

"My ideal for the American postal service is a system modeled upon a district plan, with fewer offices, and those grouped around central offices and under thorough supervision. By this means at least 20,000 offices could be abandoned that produce no revenue to the department. In the place of every abolished non-money-order and non-registry office might be put an automatic stamp-selling machine and a letter-box to receive mail. With the money saved should be instituted a system of collection and delivery by mounted carriers, bicycles, and star-route and messenger contractors, and the free delivery gradually spread all over the country. The classes of postage should be reduced to three, and the rate of postage the world over to one cent for each half-ounce for the average weight of a letter is now three-eighths of an ounce. I would indemnify, to the extent of \$10, for every lost registered letter."

Mr. Wanamaker goes on to recommend

postal telegraph and telephone, pneumatic tubes, etc. Many would go much further. Mr. J. L. Cowles, in his *A General Freight and Passenger Post* (1896), advocates the government ownership of postal, baggage, and express cars, and the operation of these services by the government, paying the railroads a reasonable sum for hauling the cars. He shows (p. 112) that the annual saving to the people would be \$22,670,257 per year, or more than enough to pay the entire equipment in a single year, after which there would be a clear gain of \$22,000,000 annually, and far better service than now.

He shows from Postmaster-General Vilas's report for 1887, that the Government then paid the railroads merely for rent of the 432 postal cars then in use (besides the 8 cents a pound for transportation), \$1,881,240 per year, while the cars could easily be re-duplicated for \$1,600,000. On one line alone \$50,037 was paid per year for rent of cars that could be built for \$17,500.

He shows (p. 68) that for transportation the Government pays the railroads on an average 8 cents a pound for an average haul of not over 4.42 miles; yet the express companies deliver goods from houses in New York to houses in Chicago for \$3 per hundred pounds, and certain transcontinental roads have been fighting for nine years for the legal right to carry foreign books, carpets, cutlery, etc., from New Orleans to San Francisco at eight-tenths of a cent a pound. Some trains (he says) get their entire cost from their receipts from the Post Office. Yet people wonder that the post-office has a deficit.

Extreme individualists would take the post-office out of government operation.

Mr. Frederick Millar, in *A Plea for Liberty* (chap. ix.), criticizing the English postal system, argues that all the reforms in the post-office system have been forced on it from without; that the very monopoly enjoyed by the State is a tacit acknowledgment of its inability to compete with private enterprise; that postage is still very much dearer than it need be; that its operations are not conducted in a business way; that in 1887 the postmaster-general declared that the theft of postal orders had "reached portentous dimensions"; that the authorities of the post-office are unjust to their employees, and the employees arbitrary and impudent to the public; that there have been strikes in the post-offices, as in any business; that the parcel post has failed to compete with the railroads; that the postal savings-banks are not as well managed as private banks, are not open at hours convenient for the working-classes; that the telegraph service does not pay; that at Christmas-time the post-office is disorganized; in a word, that the State post-office stands "self-condemned."

To this it is answered by socialists that the above writer, living where both post and telegraph are in government hands, has not had much experience of the delights of private ownership of the means of communication. The telegraph rates of the private Western Union Company of the United States are more than twice those of England (State system), and the accommodation, or lack of accommodation, the private

Socialist View.

telegraph gives to the small places is well-nigh atrocious. In the larger cities, where it pays, private companies *might* give better accommodations (tho usually they do not) than the State, but the State thinks of the whole people, and provides accommodation where it does not pay. The United States has 70,064 post-offices; the private Western Union Company has not half that number of offices. The United States postal service carries packages to small places as cheap as the private express companies do to larger places, and to thousands of places where there is no private express service. Undoubtedly, no postal service is perfect and reforms everywhere can be made, but the United States postal service has been more progressive than private companies, pays its employees higher wages, charges lower rates, has its offices open longer hours, for example, than the private telegraph offices, and accommodates far more of the population. (See TELEGRAPH; TELEPHONE; INDIVIDUALISM; SOCIALISM.)

POVERTY. For the statistics of poverty, see PAUPERISM; WEALTH (section, Distribution of); UNEMPLOYMENT; WAGES.

We consider here the meaning of poverty, the causes of poverty, and the means proposed for its prevention or relief.

I. WHAT POVERTY MEANS.

We quote upon this point a statement, written by Mr. Ira Steward, and published in the Fourth Annual Report of the Massachusetts Bureau of the Statistics of Labor (1873). He says:

"Poverty is the great fact with which the labor movement deals. The problems that now most disturb and perplex mankind will be solved when the masses are no longer poor. Poverty makes the poor poorer, and independence impossible. It corrupts judges, ministers, legislators, and statesmen. It decides marriages, shortens human life, hinders education, and embarrasses progress in every direction. It gives rise, directly and indirectly, to more anxiety, suffering, and crime than all other causes combined. Poverty crams cities, and their tenement houses, with people whose conduct and votes endanger the Republic. The dangerous classes are always *poor*. There is a closer relation between poverty and slavery than the average abolitionist ever recognized. . . . The anti-slavery *idea* was that every man had the right to go and come at his will. The labor movement asks how much this abstract right is worth, without the power to exercise it. . . . The laborer instinctively feels that something of slavery still remains, or that something of freedom is yet to come, and he is not much interested in the anti-slavery theory of liberty. He wants a *fact*, which the labor movement undertakes to supply.

"But has not the middle class its poverty—a poverty that should excite the most anxiety, and the most searching inquiry?

They are a large majority of the people, and their poverty is generally carefully concealed. . . . The middle classes have the strongest motives for never making any parade or public complaint of their poverty. To advertise oneself destitute, is to be without credit. . . . Poverty that publishes or argues one's incapacity closes many a door to more profitable or advantageous situations or promotions. The more expensive and superior style of living adopted by the middle classes, must, therefore, be considered in the light of an *investment*, made from the soundest considerations of expediency. . . . Very few among them are saving money; many of them are in debt; and all they can earn for years is, in many cases, mortgaged, to pay such debt—'debt that increases the load of the future, with the burden which the present cannot bear.' . . . The poverty of the great middle classes consists in the fact that they have only barely enough to cover up their poverty, and that they are within a few days of want, if through sickness or other misfortune employment suddenly stops. . . .

"But the most alarming fact concerning the poverty of the *native* middle classes in this commonwealth is that, for two or three decades past, marriages and births have so far decreased among them that we are nearly or quite justified in saying that they are now dying faster than their children are being born; and that it is to foreign sources (and to Americans born in other States), and to the lower class of native-born, we must credit the present increase in our census returns. . . . With the mass of intelligent people, early or late marriages, and few or no children, is largely a question of poverty and wealth. . . .

"Poverty, however, falls most crushingly on woman. In all countries, and in all ages, among the lower and middle classes, she has worked harder, and for less pay, than men. A woman who has no resources for a living except from the labor of her own hands, is tolerably sure to become in time, either the poor man's slave, or the rich man's plaything; to marry for a home, or do worse. To make prostitution unnecessary is a part of the problem of social science; but prostitution means getting a living.

The Cause of Intemperance.

The science that will solve this problem will easily dispose of war, intemperance, financial convulsions, and a dozen other evils that now disturb the peace of the race. Poverty is the mainspring of selfishness, for it is the destitution of the mass of mankind that prevents them from thinking and doing for others. As Mill says, 'all their thoughts are required for themselves.' . . . The two classes most peculiarly open to the temptation of intemperance are the very poor and the very rich young men. . . . The steps of some young men turn finally to the light, warm, welcome saloon, not from force of appetite, for they have never yet drunk enough

to create the craving for stimulating beverages, nor because it is fashionable, for their wages are not sufficient to lift them up to that level ; but because they are without homes, and are starving for society.

“The sons of the wealthy have homes, and all that money can bring for their entertainment. But in many cases they have nothing whatever to do. They are corrupted by idleness, and it is their extreme wealth that makes their hours of idleness possible. . . . The most terrible of all stagnations is idleness. It means moral and social rottenness, and intemperance is only a single manifestation of it. . . .

“No one is fully educated until the discipline of hard labor has been added to the culture of books, travel, and good society, and, on the other hand, no one is educated who has had no chance to learn anything but to work hard and steadily, and to ‘know his place.’ . . . The law of ‘supply and demand,’ so often quoted as regulating wages and prices, means nothing, more nor less, than the great fact of the poverty of the poor, and the power and comparative independence of the wealthy. . . . Starving men will always bid for wages at starvation prices. . . . The law of supply and demand is said to regulate the price of commodities, but the ‘demand’ is limited by the great fact of the poverty of the mass of consumers. . . . ‘A glut in the market’ has never yet meant anything more than that millions of people are too poor to pay for the food, clothes, houses, books, and opportunities that are waiting for customers. . . .

“It is poverty that compels one man to borrow of another, and the price paid for the use of the money loaned is what we call interest—so that interest on money is poverty again. . . . It is the enormous profits made directly upon the labor of the wage classes, and indirectly through the results of their labor, that, first, keeps them poor, and, second, furnishes the capital that is finally loaned back to them again. . . .

“It is clear that the large fortunes accumulated by the wealthy can only be defended upon the theory that their services are actually worth the compensation they receive. Are their services worth the price charged? . . . If it is fair to ask hands how much they could do without brains, it is just as fair to ask brains how long they could live without hands. The alternative presented to mankind, in case the services of managers were withdrawn, is a reduced rate of production, which means poverty. But, on the other hand, the alternative presented to those who manage labor, in case the so-called brainless workers were withdrawn, is death, or hard work with their own hands, for fields were never tilled, nor houses reared, nor garments made, nor food cooked, without manual labor. . . . The capital of the capitalist is not simply the wealth he has somehow acquired, tho this is, indeed, a very important part of his capital. The other part, without which the first would be worthless, and to which the political economist

seldom, or never, refers, but to which we now call special attention, is the great and terrible fact of the poverty of the masses. It is their poverty, destitution, and consequent dependence, that compel them, every day of their lives, to make the best terms possible with those who hold in their possession the surplus wealth of the world. . . .”

II. CAUSES OF POVERTY.

As to the causes of poverty there are various views. Professor A. G. Warner, in his *American Charities*, has collected and tabulated the findings of a large number of investigations of the causes of actual cases of poverty in the United States, England, and Germany. He includes in his table practically all the findings, as to actual cases of poverty, thus far made in a scientific way by trained investigators. His table embodies the results of investigations by the charity organization societies of Baltimore, Buffalo, and New York city, the associated charities of Boston and Cincinnati ; the studies of Charles Booth in Stepney and St. Pancras parishes in London ; the statements of Böhmert (*Armenwesen in 77 Deutschen Städten*) for 77 German cities, published in 1886. It will be seen that here, if anywhere, we have a scientific analysis of the facts of the case, as collected by persons without any particular bias, certainly not socialists. The conclusions, and especially the averages of even this table, however, should not be used without reading the explanations that follow it. We give Professor Warner's table, quoting, however, only his percentages.

Of this table Professor Warner says : (pp. 36, 37).

“The first duty of one presenting such a table as this is to indicate clearly what it does not show. It deals, as already indicated, only with the exciting causes of poverty; and yet this fact is not kept clearly in mind, even by careful workers. Mr. Booth, for instance, includes ‘pauper association and heredity’ in this list of causes; and the American societies include ‘nature and location of abode.’ Both of these are by their nature predisposing causes, rather than immediate or exciting causes; and it is confusing to mix the two. Secondly, many of the persons whose cases are here tabulated have been, as Mr. Booth says, the football of all the causes in the list. Under such circumstances to pick out one cause, and call it the most important, is a purely arbitrary proceeding. Any one of the causes might have been inadequate to produce pauperism, had not others cooperated with it. A man is drunk and breaks his leg; is the cause ‘accident’ or ‘drink’? When this question was submitted to a group of charity organization workers, it was very promptly answered by two of them; but their answers were different. A man has been shiftless all his life, and is now old; is the cause of poverty shiftlessness or old age? A man is out of work because he is lazy and inefficient. One has to know him quite well before there can be sure that laziness is the cause. Perhaps there is hardly a single case in the whole 7000 where destitution has resulted from a single cause. . . .

Explanation of Table.

“The impossibility of giving an accurate statistical description of the facts is still clearer when we try to separate the causes indicating misconduct from those indicating misfortune. Back of disease may be either misconduct or misfortune. The imprisonment of the bread-winner indicates misconduct on his part, but may only indicate misfortune on the part of wife and children. The same is true in the case of abandoned children and neglect by relatives. This particular classification is made in deference to popular inquiry

Poverty Causes Low Wages.

* Including large family, nature of abode, pauper associates, and heredity.
 † These averages are of unequal value, depending upon the number of cases they are averaged from. A glance at the columns will show how many cases each average represents. The totals and averages for drunkenness and unemployment are among the most complete.

only. In the writer's opinion its chief value consists in showing how little it is worth.

"But after all possible allowance has been made for the 'personal equation' of the investigator, and for all the inevitable inconclusiveness of the figures, there is a residuum of information to be got from the tables. They give, as well as such statistics can, the conclusions reached by those who are studying pauperism at first hand. If the figures furnished by all the investigators were added together into one great total, and this only were put before him, the author would indeed hesitate to base any conclusions whatever upon it. But when it is found that different investigators, at different times, in different places, reach conclusions which, while varying in many and often inexplicable ways, are yet in agreement as regards certain important facts, we can but think that the figures to some extent reflect actual conditions."

It will be seen from this table that the chief single cause of poverty, as here studied, is sickness or death in the families of the poor. Lack of work stands second, altho, if the averages as to lack of work, insufficient work, and poorly paid work be added together, as well they might be, they form the supreme cause of poverty. Drink stands third, tho only one-half as great a cause as unemployment. Says Professor Warner (pp. 60 and 65):

"Probably nothing in the tables of the causes of poverty, as ascertained by cold counting, will more surprise the average reader than the fact that intemperance is held to be the chief cause in only from one-fifteenth to one-fifth of the cases, and that where an attempt is made to learn in how many cases it had a contributory influence, its presence cannot be traced at all in more than 28.1 per cent. of the cases." (See *INTEMPERANCE*.) Professor Warner sums up the case by saying: "The general conclusion regarding drink as a cause of poverty is sufficiently well formulated by Mr. Booth. 'Of drink in all its combinations, adding to every trouble, undermining every effort after good, destroying the home and cursing the young lives of the children, the stories tell enough. It does not stand in apparent chief cause in as many cases as sickness and old age; but if it were not for drink, sickness and old age could be better met.'"

It will also be seen from the table that causes indicating misconduct average only 21.3 per cent., while causes indicating misfortune average 74.4, or over three times as much. Four per cent. of the cases are not classified; but the causes indicated as unclassified belong to causes indicating misfortune much more than misconduct, at least as far as the individual studied is concerned. How far poverty is the result of other people's misconduct or hereditary misconduct is not here shown. But as for the persons immediately concerned, misfortune is shown to be nearly four times as much the cause of poverty as their misconduct.

This seems to be the most careful analysis of the causes of poverty yet made; but not all will accept its conclusions. Certain schools of thought are apt to find the especial evil they attack the main cause of poverty. The followers of Mr. Henry George, for example, are apt to believe that poverty mainly exists because, on the one hand, the landowner receives the lion's share of the annual product of the community, and, on the other hand, private property in land prevents the opening up of natural opportunities. (For a discussion of this, see *SINGLE TAX*.) A large number of people believe drink to be the main cause of poverty (see *INTEMPERANCE*). In another school of thought overpopulation is the main

cause (see *MALTHUSIANISM*). Socialists usually believe that poverty mainly exists because under a competitive system the capitalistic classes take from the producing classes a large share of their product. Theologians are wont to declare that all poverty comes primarily from sin. Individualists usually assert that poverty mainly comes from the inefficiency of the workers in one form or another—shiftlessness, lack of thrift, unwillingness to save, etc., etc.

Professor F. H. Giddings of Columbia College, in his essay on the *Ethics of Social Progress*, argues that the poor are poor to-day because society does not need them and they contribute little or nothing to production. He says:

"Neither oppression nor greed has been at any time the first cause of legal bondage or of economic dependence. Both are secondary causes, induced by experiences with a slavery already existent.

"Modern civilization does not require, it does not even need, the drudgery of needle-women or the crushing toil of men in a score of life-destroying occupations. If these wretched beings should drop out of existence, and no others stood ready to fill their places, the economic activities of the world would not greatly suffer. A thousand devices latent in inventive brains would quickly make good any momentary loss. The true view of the facts is that these people continue to exist after the kinds of work that they know how to perform have ceased to be of any considerable value to society. Society continues to employ them for a remuneration not exceeding the cost of getting the work done in some other and perhaps better way.

"The economic law here referred to is one that has been too much neglected in scientific discussion. It ought to be repeated and illustrated at every opportunity, for at present it stands in direct contradiction to current prepossessions. We are told incessantly that unskilled labor creates the wealth of the world.

"It would be nearer the truth to say that large classes of unskilled labor hardly create their own subsistence. The laborers that have no adaptiveness, that bring no new ideas to their work, that have no suspicion of the next best thing to turn to in an emergency, might be much better identified with the dependent classes than with the wealth-creators. Precisely the same economic law offers the true interpretation of ancient slavery. In strictness civilization did not rest on slavery. It was not in any true sense maintained by slavery. The conditions that created the civilization created economic dependence, and they are working in the same way, with similar results, to-day. . . . The condition and assurance of freedom to-day is the ability to devise new things, to create new opportunities, to make not only two blades of grass grow where one grew before, but to make a hundred kinds of grass grow where before grew only one kind.

"Accordingly, the practically unfree task-workers of this present time are those who, unaided, can accomplish none of these new things. They are those who might do well in old familiar ways, but who have nothing to turn to when their ways cease to be of value to the world. To live they must force depreciated services upon society on any terms that society can continue to pay. They are unfree task-workers, not because society chooses to oppress them, but because society has not yet devised or stumbled upon any other disposition to make of them. Civilization, therefore, is not cruel. It is ever supporting, and trying in many ways to utilize, the wrecks and failures of its own imperfect past."

Mr. Robert Treat Paine, in an address read at the International Congress of Charities, Correction, and Philanthropy, at Chicago, in 1893, said:

"Has not the new charity organization movement too long been content to aim at a system to relieve or even uplift judiciously single cases without asking if

**Inefficiency
and Poverty.**

there are not prolific causes permanently at work to create want, vice, crime, disease, and death; and whether these causes may not be wholly or in large degree eradicated? If such causes of pauperism exist, how vain to waste our energies on single cases of relief, when society should rather aim at removing the prolific sources of all the woe.

"The four great causes of pauperism and of degraded city life have long seemed to me to be these: 1. Foul homes. 2. Intoxicating drink. 3. Neglect of child life. 4. Indiscriminate almsgiving."

Mr. Charles Booth counts up twenty-three principal causes of pauperism (*Pauperism and the Endowment of Old Age*, p. 9):

Crime, vice, drink, laziness, pauper association, heredity, mental disease, temper, incapacity, early marriage, large family, extravagance, lack of work, trade misfortune, restlessness, no relations, death of husband, desertion, death of father or mother, sickness, accident, ill luck, old age. He says, "that, as causes, old age stands first, sickness next, and then comes drink" (p. 148).

Among 1610 cases, however, of the poor and very poor in London, he shows 4 per cent. due to "loafing," 14 to drink, 27 to illness, large families, or other misfortunes, 55 to "questions of employment" (*Labor and Life of the People*, vol. i. p. 147). A large part of this lack of employment may be among the old.

Mr. J. G. Godard in his *Poverty, Its Genesis and Exodius*, argues that waste of wealth, poverty itself, are prominent causes of poverty, but that the main cause is unequal distribution. He argues that men must be poor, either because there is not enough produced for all, because some of it is wasted, or because some get too much. He shows for England that, tho' relatively the number of the poor is somewhat less to-day than it was, the annual wealth produced is nearly double what it was three generations ago, and "never in the whole history of England, excepting during the disastrous period at the beginning of the century, has the absolute number of the very poor been so great as it is now" (J. A. Hobson's *Problems of Poverty*, p. 26, 1891). Is there then, he asks, not enough produced? He shows that the total annual income of the United Kingdom in round numbers may be placed at £1,350,000,000 (Mr. Giffin in his *Essays on Finance*, vol. ii. pp. 460-72, estimating it in 1886 at £1,270,000,000). Dividing this by the population of the census returns for 1891 (37,740,283), he gets £35 per annum (£175) for each individual, or £175 (\$875) for each family of 5. He says, "Insufficient production of wealth may then be regarded as an actual cause of poverty, but one of minor influence." A more important cause of poverty he considers to be the waste of wealth. He quotes Professor Marshall as saying (*Principles of Economics*, vol. i. p. 731), "Perhaps £100,000,000 annually are spent even by the working classes, and £400,000,000 by the rest of the population of England, in ways that do little or nothing toward making life nobler or truly happier." This means a waste of over one-third of the whole. Poverty itself, he shows, causes much poverty. It checks profitable production; it causes large amounts of waste; leads to unequal distribution, compelling the poor to work for low wages. But, above all, he considers unjust distribution the main cause of poverty. He says (giving authorities for his conclusion), "One thirty-eighth of the population possess on the average £5000 per head, and thirty thirty-eighths of population possess on the average £6 per head. Inequality of distribution can scarcely be carried much further." Of the annual income he says, "Thirty million weekly wage-earners obtain £500,000,000 only; the remaining eight million persons thus receiving £850,000,000. This means that the average annual income of the one class is less than £17 per head, and the average annual income is more than £106 per head." (For other statements on this point and for authorities, and for similar facts as to the United States, see WEALTH,

Unequal Distribution.

DISTRIBUTION OF.)

III. PREVENTION AND RELIEF OF POVERTY.

The ways in which it has been or is proposed to prevent or relieve poverty are numerous as the causes assigned for it. One's conception of its main causes must obviously affect one's belief as to the way it may best be relieved or prevented. Thus the followers of Henry George believe that the solution lies along the lines of the Single Tax (*q. v.*; see also ANTI-POVERTY SOCIETY). Those who find its main cause in intemperance find its main cure in temperance (*q. v.*). Socialists find the only way out in socialism (*q. v.*). Many, and perhaps most trade-unionists, believe the main cure to be the eight-hour movement. (See SHORT HOUR MOVEMENT.) Individualists largely look for the solution to education (*q. v.*), the cultivation of thrift, etc. (See INDIVIDUALISM.) For a study of all these views we must refer the reader to their especial topics. (See also ANARCHISM; COOPERATION; UNEMPLOYMENT; CHRISTIANITY AND SOCIAL REFORM, etc.)

We review here some of the proposals for the relief of poverty which have been proposed by those who are identified with no one particular school of thought.

Mr. Charles Booth (*q. v.*), who perhaps has studied the facts of modern city poverty as carefully as any other one man, divides the residents of the poorer sections of London into eight classes: (A) The lowest class of occasional laborers, loafers, and semi-criminals; (B) the very poor, with casual earnings; (C) those of intermittent earnings; (D) of small regular earnings; (E) those of regular standard earnings, above the line of poverty; (F) the higher classes of laborers; (G) the lower middle class; (H) the upper middle class. Class A he thinks could be "harried out of existence" (*Life and Labor of the People*, vol. i. p. 160). Class B he thinks presents the main problem. It is *de trop*. The competition of B drags down C and D, and that of C and D hangs heavily upon E. We gain nothing from B. All that B does could be done by C and D in their now idle hours. . . . To bring Class B under State regulation would be to control the springs of pauperism. Hence he would put them under State control. He says: "These people should be allowed to live as families in industrial groups, planted wherever land and building materials were cheap, being well housed, well fed, and well warmed; and taught, trained, and employed from morning to night on work indoors and out, for themselves or on Government account; in the building of their own dwellings, in the cultivation of the land, in the making of furniture. . . . There would be no competition with the outside world. . . . What is the poor-law system? It is a limited form of socialism—a socialistic community (aided from outside) living in the midst of an individualist nation. My idea is to make the dual system, socialism in the arms of individualism, under which we already live, more efficient by extending somewhat the sphere of the former, and making the division of function more distinct. Our

Views of
Charles
Booth.

individualism fails because our socialism is incomplete. In taking charge of the lives of the incapable, State socialism finds its proper work, and by doing it completely would relieve us of a serious danger."

More recently Mr. Booth, in his *Pauperism and the Endowment of Old Age*, finding pauperism largely a problem of the aged (see above) has proposed a vast scheme for pensioning all aged persons. (See OLD AGE PENSIONS.)

The Rev. Samuel Barnett of St. Jude's, Whitechapel, London, is even more radical. He says (*Practicable Socialism*, revised edition, pp. 101-107): "Individuals have given their money and their time, their failure is notorious, and societies have been formed to direct their efforts. The failure of these societies is not equally notorious, but few thinkers retain the hope that societies will reform society and make the conditions of living such that people will be able to grow in wisdom and in stature to the full height of their manhood. If it were a sight to make men and angels weep, to see one rich man struggling with the poverty of a street, making himself poor only to make others discontented paupers, it is as sad a sight to see societies hopelessly beaten and hardened into machines with no reach beyond their grasp. The deadness of these societies or their ill directed efforts have roused, in the shape of charity organization workers, a most striking missionary enterprise. The history of the movement as a mission has yet to be written; the names of its martyrs stand in the list of the 'unknown good,' but the most earnest members of a charity organization society cannot hope that organized almsgiving will be powerful so to alter conditions as to make the life of the poor a life worth living. Societies which absorb much wealth, and which relieve their subscribers of their responsibility, are failing; it remains only to adopt the principle of the education act, of the poor-law, and of other socialistic legislation, and call on society to do what societies fail to do. There is much which may be urged in favor of such a course. It is only society, or to use the title by which society expresses itself in towns, it is only

**Views of
Canon
Barnett.**

town councils which can cover all the ground and see that each locality gets equal treatment. . . . The first need is better dwellings. . . . Insanitary conditions and high rents are the points to which consideration must be directed. . . . Wise town councils, conscious of the mission they have inherited, could destroy every court and crowded alley, and put in their places healthy dwellings; they could make water so cheap, and bathing places so common, that cleanliness should no longer be a hard virtue; they could open playgrounds and take away from a city the reproach of its gutter children; they could provide gardens, libraries, and conversation rooms; they could open picture galleries and concerts; they could light and clean the streets of the poor quarters; they could give medicine to heal the sick, money to the old and poor, a training for the neglected, and a home

for the friendless. The first practical work is to rouse the town councils to the sense of their powers; to make them feel that their reason of being is not political but social, that their duty is not to protect the pockets of the rich, but to save the people. . . . If it be urged that when town councils do for social reform all which can be done, the condition will still be unsatisfactory, I agree; . . . no social reform will be adequate which does not touch social relations, bind classes by friendship, and pass through the medium of friendship the spirit which inspires righteousness and devotion. If therefore the first practical work of reformers be to rouse town councils, their second is to associate volunteers who will work with the official bodies. . . . As a rule it may be laid down that the voluntary work is most effective which is in connection with official work. . . . Teetotal advocates will preach in vain that drunkenness is the root of all evil, and that a nation of abstainers will be either a healthy, a happy, or a thoughtful nation. Thrift will be seen to be powerless to do more than to create a smug and transient respectability. . . . The nationalization of luxury must be the object of social reformers."

Mr. Robert Treat Paine, in the address above quoted, opposes Mr. Booth's plan, but is almost equally radical. He says:

"The problem of poor relief in great cities has got to be restated in ampler terms. The diseases of society are more aggravated, the dangers are graver, the need of radical remedies is more absolute than the new charity has yet fully and fairly faced. . . .

**Robert
Treat Paine.**

"When the poor sink below their poverty into pauperism, and pauperism becomes hopeless and degraded and brutal; when powerful and prolific causes are at work to swell the rising tide,—the day has gone when it is enough to go on dealing with details. . . .

"Pauperism is assuming a new and more terrible type in the largest cities, where paupers have lived so long in this condition that they know nothing better. . . . Strong drink is almost the sole solace of their dull routine. . . .

"Crimes of violence, crimes of lust, crimes against property not only prevail, but cease to shock, where the general level of life has lapsed into a new phase of barbarism. . . .

"What hope for boys and girls growing up in such atmosphere of sin, in overcrowded cities from which playgrounds have been excluded by rising rents; playgrounds for the innocent outpouring of the boys' animal spirits which will have some vent, if not in hockey and football, then in breaking into empty buildings, stealing lead pipes and stoning dispensary doctors or police with even-handed delight. . . .

"With population rents rise so that the average man—that is, the mass of the people—is forced to live in utterly unfit homes, fearfully overcrowded; hence, low vitality of body and soul, diseased morals and diseased bodies. . . .

"Repression alone is a failure. . . . In some cities all these evils are aggregated into great masses. . . .

"Merely to deal, no matter how wisely, with single cases of distress or crime, as they arise, is infinitely insufficient. . . .

"In the largest cities, where conditions are worse and the evils of pauperism, grown chronic and contagious, are blended with habits of drunkenness and other vice, breaking out into crimes against the law, pauperism cannot wisely be considered alone, but the problem of how to uplift the general level of life must be studied as *one whole problem*, especially as to the causes of the evils. . . .

"The methods of dealing with pauperism hitherto applied are impotent against this swelling tide of brutal, degraded pauperism. . . .

"Who does not know," says Professor H. C. Adams, 'that much of our so-called philanthropy tends to perpetuate those conditions which seem to make philanthropy necessary?' Professor W. G. Tucker, in his Phi Beta oration at Harvard last June, compels us to seek more radical cure, by more radical measures, when he says: 'The philanthropy which is content to relieve the sufferer from wrong social conditions, postpones the philanthropy which is determined at any cost to right those conditions.'

"Pauperism, vice, and crime are common factors of the inseparable and tremendous problem how to uplift the general conditions of life among the poor."

Mr. Paine then states what he believes to be the causes of poverty (see above) and then says:

"Which of the two causes dragging down the conditions of life among the masses, foul homes or intoxicating drink, is more potent, I do not know. Each leads surely to the other.

"Everywhere the conviction gains ground that it is impossible to elevate the conditions of the lower class of working people above the condition of their homes.

"Would to God my words could strengthen the conviction of every delegate to this Congress, as he goes home to his own city, that slums must be abolished!

"Probably no city has been wholly inactive. But I am sure no large city in this country has begun to act up to the standard required for the health or morals of the poor, or by economy to the public, or by principles of justice and right.

"Boards of health probably have power in all cities to vacate dwellings unfit for human habitation. All that is needed is *aroused public interest* to learn the unspeakable horrors of the homes of the wretched poor to-day, and then to insist on a *higher standard of habitability*.

"Boards of health will follow the public command and the public conscience. . . .

"Three agencies directly deal with the task of fitly housing the people:

"1. Philanthropic agencies which aim to improve the condition both of tenants and of the tenements they occupy.

"2. Economic agencies providing decent homes, often in model buildings.

"3. Municipal agencies aiming to abolish the worst evils and to destroy foul homes.

"High above each and all of these three agencies in its influence and promise of grand results I place the rising ambition of working men themselves to own their own homes. . . .

"If this laudable ambition is lacking among the lowest class, so also do both of the powerful agencies at work to provide model homes, whether by philanthropic or invested capital of which I have just spoken, shoot over their heads.

"The agency which must be invoked to rescue the very poor, whether virtuous and struggling or degraded and indifferent, is *the municipal power to destroy utterly unfit abodes of habitation*.

"Sad, indeed, is the fact that when charity aids some wretched family to move out of a vile basement or dark and nasty slum, presently some other like family moves in.

"The growth of public sentiment toward practical unanimity in this decision has been marked by important measures in London, Glasgow, and other cities of Great Britain. (See TENEMENT PROBLEM.)

"Intoxicating drink is the second great cause of pauperism, crime, and many other wretched conditions of degraded life.

"The temperance reform makes perceptible headway, altho the most powerful passions of mankind oppose its progress. In the last ten years England has seen a great improvement in the conditions of the working people in this respect.

"In the United States prohibition, or high license, or restricted license, or the Gothenburg system, or that new State system in South Carolina, or local option which secures no license in many cities and towns—all these movements mark a great popular awakening to the terrible influence of drunkenness upon the welfare of the people. . . .

"My object here is to propose and stimulate an alliance of these two forces, the friends of temperance and all the other forces working to improve the conditions of the poor. Such an alliance will strengthen,

both and lead each party to see the broader scope of their task. (See TEMPERANCE.)

"The third prolific cause of pauperism is found in the conditions of neglect or maltreatment of child-life in great cities. The Hon. A. S. Hewitt, in his address at the opening of the United Charities building of New York (*Charities Review*, April, 1893, p. 304), says: 'In this city a large number of children of both sexes live in an atmosphere of poverty and vice, and even crime, which educates them to be paupers and criminals instead of training them to become honest workmen and good citizens. And for this result, which is generally no fault of their own, they are punished, and, along with them, the industrious class of the community is also punished by taxation for the support of poorhouses, hospitals, and criminals. . . . Gangs of young men, not yet twenty-one years of age, are to be found in many parts of the city who, not having been permitted to learn trades, or having been denied the opportunity to follow some useful occupation, have grown up in idleness, and expend their animal energies in excesses which make them a terror to the neighborhood and a trial to the police, the only barrier between them and crime. In time most of them necessarily become criminals, and they are very sure to breed criminals.' (See DEPENDENT CHILDREN.)

"Indiscriminate almsgiving is the fourth and a most potent cause of pauperism. . . .

"Three reforms of the abuses of outdoor relief should receive universal sanction, and will effect in very large measure the end which all parties desire: dealing with the unworthy, those out of work, and the inefficient.

"First. To the unworthy, rigid prohibition of all relief, public or private, so that, abandoning all hope of it, they shall seek their own support. This includes the lazy, idle, shiftless, extravagant, or vicious paupers, as also in most cases those with relatives or friends.

"Second. The provision for men or women out of work demands most serious study of ablest economists and statesmen. (See UNEMPLOYMENT.)

"Third. The third and grand reform aims to recreate the inefficient, always in great cities a numerous class, into self-support by skill and cheer, and to save them from gratuitous relief as deadly poison. . . . One of the best standards to-day to test the progress of constructive Christian charity of the various towns and cities of our own or any country, is to see what practical measures have been devised to convert the inefficient into an efficient worker." (See INDUSTRIAL EDUCATION.)

Mr. H. M. Boies, in his *Prisoners and Paupers*, argues that one of the first things society should do is to stop the breeding of paupers and criminals. (See CRIMINOLOGY.) Of illegitimates he says:

"The first object society has to consider in the matter is to stop this illegitimate increase. The second is the reformation of the mother and of the father, if he can be caught. The third, the rearing of the children into the condition of independent good citizens. . . .

"Homeless children are a still larger class of paupers needing special care and attention. The deserted waifs of our city streets, the neglected offspring of the criminal and drunkard, orphans and half-orphans of the indigent, who may be unable or unfit to properly rear them, constitute an important and growing element of our denser communities, and require the immediate consideration of legislators for the protection of society. The pressure of necessity has compelled charitable societies and individuals to establish houses of correction and refuge, juvenile asylums, homes for the friendless, children's aid societies, and similar institutions here and there; but they are managed without any general, regular, or complete system, according to the ideas and ability of their benevolent promoters, and afford but a local and sporadic relief. (See DEPENDENT CHILDREN.)

"We have yet the third class of paupers for whom to provide. These are the wounded, maimed, exhausted, and sick in the battle of life; the true objects of charity and benevolence. Many of these have fallen out in the march from inherited weakness, or incapacity, but they have bravely undertaken the struggle, and are entitled to social and human sym-

H. M. Boies.

pathy and care. The sterner restrictions of legislative enactments are unnecessary, except to secure to them the aid and relief they may be unable alone to obtain. There are two methods of bestowing this in common use: one known as 'outdoor relief'; the other as 'almshouse treatment.'

"Public 'outdoor relief' is liable to serious abuse and imposition. Almost universally it makes confirmed paupers of the recipients, who soon come to depend upon, and demand it as a right due them from the public treasury. On these accounts 'outdoor relief' is regarded with disfavor by the public and humanitarians. As the administering officials are generally unable to properly investigate applications, they encourage fraudulent claims, waste the public funds, or pervert them to political purposes, thus stimulating instead of reducing pauperism. . . . Public outdoor relief should be prohibited by law, except in cases of sudden calamity, and to assist honest, hard-working children to maintain indigent parents at home; or indigent widows to keep their children under their own care. All other proper objects of charity should be provided for either in the almshouse or by private benevolence. This latter should be allowed opportunity, as a public necessity, to foster the birth and growth of divine charity in the human heart. For upon the development and diffusion of this spirit depends all human progress. In order that private benevolence may be wisely and efficiently administered in these days of steam and electricity, when those best able to give are least able to investigate, because of the incessant pressure of personal affairs upon their time, a system and organization are necessary. For it must be accepted as an axiom that every dollar that is given for the mere asking is worse than wasted.

"How then shall the real objects of charity, our third class of heterometrics, be provided for? That is, those whom age, disability, infirmity, or misfortune have rendered permanently dependent?

"Proper legislation might materially reduce the number of these also, by enforcing the support of the aged and children by the next of kin wherever it is possible. . . . [As for the remainder] experience and theory agree in an indisputable demonstration that they must be cared for in public almshouses. It is unwise and unsafe to attempt regular and permanent relief to them in any other way, for any other plan inevitably results in neglect and suffering to the worthy, in great imposture and abuse of charity, and in the increase of pauperism to an insupportable extent. It must be accepted as an axiom of public relief that, when it is to be continuous and regular, the aid must be rendered in a regularly organized institution. To this the applicant for assistance must be transferred before public support by taxation can be conferred. As the duty of maintenance rests upon society in general, the response must be from the social organization, and not from private charity; by equal taxation of all, rather than the benevolence of a few, however large their interest."

A full discussion of these various measures will be found under their respective heads. It should, however, here be plainly stated that many question the efficiency of many of these reforms, at least so far as they are carried alone. The importance of temperance as an effectual element in social progress no thinking man can question, but many economists hold that, *by itself*, temperance would not raise the wages of the poorer paid workmen *as a class*. Here and there if individuals give up drinking, they are able to save more, but if enough should give up drinking to make it affect the general class, it would probably lower their wages by the amount they would save in drink, for the simple reason that, under competition, laborers cannot get wages much above the cost of living in their class. If any employer should pay higher wages, some rival employer would get workmen—and under competition could get workmen—at a lower price, and so be able to produce cheaper, sell cheaper, and thus drive the more generous employer out of the market.

Employers, therefore, under competition, have no choice. They *must* pay wages enabling employees to live about on the standard of living of their trade and class. If, therefore, by temperance you lower the cost of living of a class, you will lower the price of wages by about the same amount.

So, to a less extent, with model dwellings and artisans' dwellings. Since the poorest often cannot be got to pay for their own house, or to occupy a model dwelling, the plan for workmen to own their homes, or occupy model dwellings, simply enables a somewhat high grade of labor to live more cheaply on the improved level, and so eventually to bring down their wages. Once more, workmen owning their homes cannot move to suit the shifting demands of the market. Nor can they strike. They are, therefore, much more under the power of their employer and compelled to accept what wages the employers are willing to give. Most trade-union leaders discourage men from owning their homes.

So, too, with technical education, says J. A. Hobson (*Problems of Poverty*, p. 179):

"In so far as technical education or general education enables a number of men who would otherwise have been unskilled laborers to compete for skilled work, it will no doubt enable these men to raise themselves in the industrial scale; but the addition of their number to the ranks of skilled labor will imply an increase in supply of skilled labor, and a decrease in supply of unskilled labor; the price or wage for unskilled labor will rise, but the wage for skilled labor will fall, assuming the relation between the demand for skilled and unskilled labor to remain as before."

It should be remembered, however, that these objections are not objections to the propositions in themselves, but to relying on them *alone* to meet the problems of poverty. As a part of social programs, together with other reforms studied elsewhere (see SOCIALISM; INDIVIDUALISM; SHORT HOUR MOVEMENT; SINGLE TAX), all admit these propositions to have their place. Says Mr. Hobson (*idem*, p. 181):

"There are those who seek to retard all social progress by a false and mischievous dilemma, which takes the following shape: No radical improvement in industrial organization, no work of social reconstruction can be of any real avail, unless it is preceded by such moral and intellectual improvement in the condition of the mass of workers as shall render the new machinery effective; unless the change in human nature comes first, a change in external conditions will be useless. On the other hand it is evident that no moral or intellectual education can be brought effectively to bear upon the mass of human beings, whose whole energies are necessarily absorbed by the effort to secure the means of bare physical support. Thus it is made to appear as if industrial and moral progress must each precede each other, which is impossible. . . . The falsehood in the above dilemma consists in the assumption that industrial reformers wish to proceed by a sudden leap from an old industrial order to a new one. Such sudden movements are not in accordance with the gradual growth which nature insists upon as the condition of wise change. But it is equally in accordance with nature that the natural growth precede the moral. Not that the work of reconstruction can lag far behind. Each step in this industrial advancement of the poor should, and must, if the gain is to be permanent, be followed closely and secured by a corresponding advance in moral and intellectual character and habits. But the moral and religious reformer should never forget that, in order of time, material reform comes first."

POWDERLY, TERENCE VINCENT, long General Master Workman of the Knights of Labor, was born at Carbondale, Pa., January 24, 1849, of Irish parentage. He attended school six years, and at 13 became a switch-tender for the Delaware & Hudson Coal Company, entering its machine shop a year later. In 1869 he went to Scranton, Pa., and shortly afterward joined the Machinists and Blacksmiths' National Union, soon becoming its president. His study of the labor problem led him to join the Knights of Labor, in which order he held various offices in the local and district assemblies. In January, 1879, he was chosen General Worthy Foreman, and in September of the same year was elected General Master Workman, which office he held 13 years. Mr. Powderly was Mayor of Scranton for two years, but declined a renomination in 1884. He practically reorganized the Knights of Labor (*q. v.*), and gave his whole time and talents to the cause.

In 1892, owing to dissensions in the order, he was defeated for reelection, and Mr. J. B. Sovereign was chosen in his place. The order, however, had long before this begun to decline, owing mainly to opposition to the policy of the Knights, in failing to sufficiently respect the autonomy of each trade, and in concentrating too much power in the General Executive Board. It was this policy which has given Mr. Powderly many enemies in the labor movement, but no one has questioned his ability and long usefulness to the cause of labor.

PREEMPTION LAW. See PUBLIC DOMAIN.

PRESBYTERIAN CHURCH AND SOCIAL REFORMS, THE.—The Presbyterian Church is committed to the cause of social reforms, first of all, by the principles on which such reforms rest. They were first most clearly enunciated and sharply defined by John Calvin. Mr. Froude says of him, "There was no reformer in Europe so resolute to tear out and destroy what seemed to be false, and so resolute to establish what was true in its principles and make truth to its last fiber the rule of practical life." These characteristics of the stern leader were so wonderfully impressed on his followers that they wrought for the good of man and from the highest motives. Mr. Froude says again, "The Calvinists abhorred, as no other body of men has ever abhorred, mendacity, all impurity, all moral wrong of every kind as they could recognize it. Whatever exists at this moment in England or Scotland of the fear of doing evil is the remnant of the convictions branded by the Calvinists into the people's hearts."

Green, in his *History of the English People*, recognizes truly the genius of the new life of Europe and of the Reformation, when he says, "A vast and consecrated democracy, it stood in contrast with the whole social and political framework of the European nations. Grave as we count the faults of Calvinism, alien as its temper may be in many ways from the temper of the modern world, it is in Calvinism that the modern world strikes its roots, for it was Calvinism that first revealed the worth and dignity of man. Called of God and heir of heaven, the trader at his counter and the digger of the field suddenly rose into equality with the noble and the king." The idea of the Reformation which is traceable to Calvin has often been regarded as largely theological in its character, and as dealing with speculative rather than practical truths. This is not true. The Reformation was not more of a theological than of a social and public reform. It was an endeavor to deliver people from their ignorance and sin, first by giving them right views of the truth and then adjusting their relations with one another. Consequently the nerve ideas distinctly traceable to Geneva and John Calvin have secured our modern civilization. Democratic government, free institutions, free schools, and popular education—these are the great pillars on which our social reforms rest. The struggle for these constituted the great battles in Holland, France, England, and later, in the United States. It required a revolution in all of these countries to establish these institutions, and our own Revolution was nothing, as Bancroft has said, "But the application of the principles of the Reformation to our civil government." The history of the Presbyterian Church has been a history of the struggle for the rights of man. It was a body of Presbyterians who wrote the Mecklenberg Declaration—the pen stroke that in 1775 separated one county in North Carolina from the British Crown, and which first asserted the principle that Americans are, and of right ought to be, free and independent. Dr. John Witherspoon was not more eminent as a theologian than as a patriot. The Synod of New York and Philadelphia was the first religious body to favor open resistance to England. Many of the Presbyterian ministers were actually engaged in civil service for their country. The blood of the Covenanter fought in the battles of the Revolution. The things at stake in these battles are the things at the bottom of all social reform. There is no progress of man without constitutional government, popular education, and deference to the rights of the people.

The Presbyterian Church, then, by reason of her principles, and of her history in illustrating and defending them, should be actively committed to every phase of social reform. Her protests against every evil have been constant and emphatic. Take, for example, the temperance reform, the center of all social reform; in this the Presbyterian Church has been unwavering in her testimony.

History.

Even as far back as 1854 the General Assembly took the following action :

" *Resolved*, That the General Assembly continue to view with deep interest the progress of the temperance reformation, most intimately connected with the vital interests of men for time and eternity, and that they do especially hail its new phase through the action of several State legislatures, by which the tariff in intoxicating liquors as a beverage is entirely prohibited. They commend this new system of legislation to the attention and support of all ministers and churches connected with this body for its blessed results already experienced, and as able, if universally adopted, to do much to seal up the great fountains of drunkenness, pauperism, and crime, and relieve humanity of one of its most demoralizing and distressing evils."

Then, as late as 1885, the same General Assembly adopted the following resolution :

"This General Assembly repeats the unvarying testimony of preceding assemblies against this wide-spread and destructive vice. That in the view of the evils wrought by this scourge of our race, this assembly would hail with acclamations of joy and thanksgiving the utter extermination of the traffic in intoxicating liquors as a beverage, by the power of the Christian conscience, public opinion, and the strong arm of the civil law."

No church can take a position more advanced and radical upon this subject than has steadily been taken by the Presbyterian Church.

In the matter of the anti-slavery reform the Presbyterian Church encountered peculiar difficulty because she was strong in the slaveholding States and the anti-slavery agitation divided the Church. But at a time when other churches had taken no strong general action upon this subject—namely, as early as 1818—the General Assembly took the following action:

"The General Assembly of the Presbyterian Church, having taken into consideration the subject of slavery, think proper to make known their sentiments upon it to the churches and people under their care. We consider the voluntary enslaving of one part of the human race by another as a gross violation of the most precious and sacred rights of human nature, as utterly inconsistent with the law of God, which requires us to love our neighbor as ourselves, and as totally irreconcilable with the spirit and principle of the gospel of Christ, which enjoin that 'all whatsoever you would men should do unto you, do ye even so to them.' Slavery creates a paradox in the moral system : it exhibits rational, accountable, and immortal beings in such circumstances as to scarcely leave them the power of moral action. It exhibits them as dependent on the will of others whether they shall receive religious instruction; whether they shall know and worship the true God; whether they shall enjoy the ordinances of the gospel; whether they shall perform the duties and endearments of husbands and wives, parents and children, neighbors and friends; whether they shall preserve their chastity and purity or regard the dictates of justice and humanity. Such are some of the consequences of slavery—conse-

quences not imaginary, but which connect themselves with its very existence. The evils to which the slave is ever exposed often take place in fact, and in their very worst degree and form; and where all of them do not take place,—as we rejoice to say, in many instances, through the influence of the principles of humanity and religion on the minds of the masters, they do not,—still, the slave is deprived of his natural right and degraded as a human being, and exposed to the danger of passing into the hands of a master who may inflict upon him all the hardships and injuries which inhumanity and avarice may suggest."

Surely this early declaration, repeatedly affirmed by subsequent assemblies, may be regarded as the moral seed which finally, through fire and flood, ended in the harvest of the emancipation.

In the various lines of moral reform, both in society and in the State, the Presbyterian Church is probably doing her full share. She is striving to apply the highest power of her principles to the deepest needs of man. The ethical possibilities of Christianity are about to be proven as never before. Strong men are rising up to attack the wild beasts of evil passions that so long have had their hands on the nation's throat—the beasts of intemperance, licentiousness, greed of money, prostitution of official position, tyranny of the strong over the weak. These beasts have made our fair cities bloody with their rage and assaulted the fair name of our country as the home of liberty and the friend of man. And these reforms are being pushed forward in the name of the Lord of hosts. And in this forward movement Presbyterian ministers and laymen have been, as they should be, conspicuous. They had been false to the historic glory of Presbyterians if they had not stood valiantly against every form of oppression and of unrighteousness.

CHARLES L. THOMPSON.

PRESIDENCY (UNITED STATES).—For the present constitutional functions of the office of the President of the United States, see article CONSTITUTION; for the present method of electing the President, see ELECTORAL COLLEGE.

We give in this article for conveniences of reference, first, the electoral and popular votes for Presidents at the different elections, and, secondly, a statement of various views as to the presidency and the prominent suggestions that have been made as to reforms in the office. We give, first, the electoral and popular votes from 1824 to 1892; second, the votes by States in the recent elections; and, third, the elections from 1789 to 1820.

It will be remembered that the President and Vice-President of the United States are chosen by officials termed "Electors" in each State, who are, under existing State laws, chosen by the qualified voters thereof by ballot, on the first Tuesday after the first Monday of November of every fourth year preceding the year in which the Presidential term expires.

The Constitution of the United States prescribes that each State shall "appoint," in such manner as the Legislature thereof may direct, a number of Electors equal to the whole number of Senators and Representatives to which the State may be entitled in Congress.

The various votes have been as follows :

ELECTORAL AND POPULAR VOTES.

Year of Election.	Candidates for President.	States.	Political Party.	Popular Vote.	Plurality.	Electoral Vote.	
1824.....	Andrew Jackson.....	Tennessee.....	Republican.....	155,872	50,551	(a) 99

	Simon Wing.....	Massachusetts.....	Socialist Labor.....	21,164		..	

* The candidates starred were elected. (a) No candidates having a majority of the electoral vote, the House of Representatives elected Adams. (b) Eleven Southern States, being within the belligerent territory, did not vote. (c) Three Southern States disfranchised. (d) Horace Greeley died after election, and Democratic electors scattered their vote. (e) There being a dispute over the electoral votes of Florida, Louisiana, Oregon, and South Carolina, they were referred by Congress to an electoral commission, composed of eight Republicans and seven Democrats, which, by a strict party vote, awarded 185 electoral votes to Hayes, and 184 to Tilden.

The following was the popular and electoral vote for President in 1896 by States :

STATES AND TERRITORIES.	POPULAR VOTE.							ELECTORAL VOTE.

Utah	64,851	13,461	51,390 B	3	..
Vermont	10,637	51,127	1,331	733	40,490 McK	..	4
Virginia	154,709	135,368	2,129	2,350	108	19,341 B	12	..
Washington	51,557	39,124	1,499	805	111	12,433 B	4	..
West Virginia	92,927	104,414	677	1,203	11,487 McK	..	6
Wisconsin	165,523	268,135	4,584	7,509	346	1,314	102,612 McK	..	12
Wyoming	10,655	10,072	136	583 B	3	..
Total	6,454,943	7,105,959	132,870	131,748	13,873	36,260	176	271

Popular vote, McKinley over Bryan	651,016
Popular vote, McKinley over all	336,265
Pluralities, McKinley	1,516,602
Pluralities, Bryan	965,586
Electoral vote, McKinley over Bryan	95
Straight Fusion vote for Bryan	6,304,300
Straight Populist vote for Bryan	150,643
Total Popular vote, 1896	13,875,653

It can be seen from the above table that 20,259 more votes for Bryan instead of McKinley would have given Bryan the election if thus distributed; 141 in Kentucky giving him 12 more electoral votes (he received 1 electoral vote in Kentucky); 1059 in Oregon with 4 electoral votes; 1399 in California giving him 8 more electoral votes (he received 1 electoral vote in California); 2825 in North Dakota with 4 electoral votes; 5744 in West Virginia with 6 electoral votes, and 9091 in Indiana with 15 electoral votes. Or 40,518 votes in those States for Bryan instead of some other candidate than either McKinley or Bryan would have elected Bryan.

McKinley carried 23 States and Bryan 22, besides gaining an electoral vote each in 2 States reckoned in McKinley's 23. The candidates in 1896 for Vice-Presidents were Garret A. Hobert, of New Jersey, Republican, who received 271 electoral votes, and was elected; Arthur Sewall, of Maine, Democrat, who received 176 electoral votes; Thomas E. Watson, of Georgia, Populist; Hale Johnson, of Illinois, Prohibitionist; Simon B. Buckner, of Kentucky, National Democrat; Matthew Maguire, of New Jersey, Socialist Labor Party; James H. Southgate, of North Carolina, National (Free Silver Prohibition Party).

Plurality	9,464	23,093	95,531	379,025	

* 1880.—Greenback, 308,578; Prohibition, 10,395; American, 707; imperfect and scattering, 989. All over Garfield, 311,115.
 † 1884.—Blank, defective, and scattering, 14,994. In consequence of the uncertainties in the count resulting from the "fusions" formed, the plurality shown for Cleveland must be considered an approximation to the actual result—not a definite result. All over Cleveland, 317,638.
 ‡ 1888.—Coward, United Labor, 3973; Curtis, American, 1591; Socialist, 2668; scattering, 7777. All over Harrison, 566,544.
 § 1892.—In the Harrison vote in Texas are included 3969 votes cast for a Republican electoral ticket known as the "Lilly White." In Alabama and Louisiana there were some Republican fusions with the People's party, and in Colorado, Idaho, Kansas, Nevada, North Dakota, South Dakota, and Wyoming there were Democratic fusions with the People's party. In each case the "fusion" vote is counted for Weaver, except in Louisiana, where it is equally divided between Harrison and Weaver. In Virginia, Connecticut, 329; Maine, 336; Maryland, 27; Massachusetts, 649; New Jersey, 1337; New York, 17,958; Pennsylvania, 898; total, 21,534; percentage, 0.17; scattering, blank, and defective, 21,266. All over Cleveland, 969,205.
 Per cent and Plurality are based on the total vote of 4,444,952.

The record of any popular vote for electors prior to 1824 is so meager and imperfect that a compilation would be useless. In most of the States, for more than a quarter century following the establishment of the Government, the State legislatures "appointed" the Presidential electors, and the people, therefore, voted only indirectly for them, their choice being expressed by their votes for members of the legislature. In this tabulation only the aggregate electoral votes for candidates for President and Vice-President in the first nine quadrennial elections appear.

1789. Previous to 1804, each elector voted for two candidates for President. The one who received the largest number of votes was declared President, and the one who received the next largest number of votes was declared Vice-President. The electoral votes for the first President of the United States were: George Washington, 69; John Adams of Massachusetts, 34; John Jay of New York, 9; R. H. Harrison of Maryland, 6; John Rutledge of South Carolina, 6; John Hancock of Massachusetts, 4; George Clinton of New York, 3; Samuel Huntington of Connecticut, 2; John Milton of Georgia, 2; James Armstrong of Georgia, Benjamin Lincoln of Massachusetts, and Edward Telfair of Georgia, 1 vote each. Vacancies (votes not cast), 4. George Washington was chosen President, and John Adams Vice-President.

1792. George Washington, Federalist, received 132 votes; John Adams, Federalist, 77; George Clinton of New York, Republican,* 50; Thomas Jefferson of Virginia, Republican, 4; Aaron Burr of New York, Republican, 1 vote. Vacancies, 3. George Washington was chosen President, and John Adams Vice-President.

1796. John Adams, Federalist, 71; Thomas Jefferson, Republican, 68; Thomas Pinckney of South Carolina, Federalist, 59; Aaron Burr of New York, Republican, 30; Samuel Adams of Massachusetts, Republican, 15; Oliver Ellsworth of Connecticut, Independent, 11; George Clinton of New York, Republican, 7; John Jay of New York, Federalist, 5; James Iredell of North Carolina, Federalist, 3; George Washington of Virginia, John Henry of Maryland, and S. Johnson of North Carolina, all Federalists, 2 votes each; Charles Cotesworth Pinckney of South Carolina, Federalist, 1 vote. John Adams was chosen President, and Thomas Jefferson Vice-President.

1800. Thomas Jefferson, Republican, 73; Aaron Burr, Republican, 73; John Adams, Federalist, 65; Charles C. Pinckney, Federalist, 64; John Jay, Federalist, 1 vote. There being a tie vote for Jefferson and Burr, the choice devolved upon the House of Representatives. Jefferson received the votes of 10 States, which, being the largest vote cast for a candidate, elected him President. Burr received the votes of four States, which, being the next largest vote, elected him Vice-President. There were 2 blank votes.

1804. The Constitution of the United States having been amended, the electors at this election voted for a President and a Vice-President, instead of for two candidates for President. The result was as follows: For President, Thomas Jefferson, Republican, 162; Charles C. Pinckney, Federalist, 14. For Vice-President, George Clinton, Republican, 162; Rufus King of New York, Federalist, 14. Jefferson was chosen President, and Clinton Vice-President.

1808. For President, James Madison of Virginia, Republican, 122; Charles C. Pinckney of South Carolina, Federalist, 47; George Clinton of New York, Republican, 6. For Vice-President, George Clinton, Republican, 113; Rufus King of New York, Federalist, 47; John Langdon of New Hampshire, 9; James Madison, 3; James Monroe, 3. Vacancy, 1. Madison was chosen President, and Clinton Vice-President.

1812. For President, James Madison, Republican, 138; De Witt Clinton of New York, Federalist, 89. For Vice-President, Elbridge Gerry of Massachusetts, Republican, 131; Jared Ingersoll of Pennsylvania, Federalist, 86. Vacancy, 1. Madison was chosen President, and Gerry Vice-President.

1816. For President, James Monroe of Virginia, Republican, 183; Rufus King of New York, Federalist, 34. For Vice-President, Daniel D. Tompkins of

New York, Republican, 183; John Eager Howard of Maryland, Federalist, 22; James Ross of Pennsylvania, 5; John Marshall of Virginia, 4; Robert G. Harper of Maryland, 3. Vacancies, 4. Monroe was chosen President, and Tompkins Vice-President.

1820. For President, James Monroe of Virginia, Republican, 231; John Q. Adams of Massachusetts, Republican, 1. For Vice-President, Daniel D. Tompkins, Republican, 218; Richard Stockton of New Jersey, 8; Daniel Rodney of Delaware, 4; Robert G. Harper of Maryland, and Richard Rush, of Pennsylvania, 1 vote each. Vacancies, 3. James Monroe was chosen President, and Daniel D. Tompkins Vice-President.

As to the working of the present constitutional conception of the President's office, there are various views. Mr. James Bryce (*The American Commonwealth*, the first edition, chap. vii.) says:

"Altho the President has been, not that independent good citizen whom the framers of the Constitution contemplated, but, at least during the last 60 years, a party man, seldom much above the average in character or abilities, the office has attained the main objects for which it was created. Such mistakes as have been made in foreign policy, or in the conduct of the administrative departments, have been rarely owing to the Constitution of the office or to the errors of its holder."

Nevertheless he tells us that this must not make us overlook certain defects incidental to the American Presidency. He says:

"In a country where there is no hereditary throne nor hereditary aristocracy, an office raised far above all other offices offers too great a stimulus to ambition. This glittering prize, always dangling before the eyes of prominent statesmen, has a power stronger than any dignity under a European crown to lure them (as it lured Clay and Webster) from the path of straightforward consistency. One who aims at the Presidency—and all prominent politicians do aim at it—has the strongest possible motives to avoid making enemies. Now a great statesman ought to be prepared to make enemies. It is one thing to try to be popular—an unpopular man will be unimportant—it is another to seek popularity by courting every section of your party. This is the temptation of Presidential aspirants."

"A second defect is that the Presidential election, occurring once in four years, throws the country for several months into a state of turmoil, for which there may be no occasion. Perhaps there are no serious party issues to be decided, perhaps the best thing would be that the existing administration should pursue the even tenor of its way. The Constitution, however, requires an election to be held, so the whole costly and complicated machinery of agitation is put in motion; and if issues do not exist, they have to be created."

"Again, these regularly recurring elections produce a discontinuity of policy. Even when the new President belongs to the same party as his predecessor, he usually nominates a new cabinet, having to reward his special supporters."

"Fourthly. The fact that he is reeligible once, but (practically) only once, operates unfavorably on the President. He is tempted to play for a renomination by so pandering to active sections of his own party, or so using his patronage to conciliate influential politicians, as to make them put him forward at the next election. On the other hand, if he is in his second term of office, he has no longer much motive to regard the interests of the nation, because he sees that his own political death is near."

"Fifthly. An outgoing President is a weak President. During the four months of his stay in office after his successor has been chosen, he declines, except in cases of extreme necessity, to take any new departure, to embark on any executive policy which cannot be completed before he quits office. This is, of course, even more decidedly the case if his successor belongs to the opposite party."

"Lastly. The result of an election may be doubtful, not from equality of votes, for this is provided against, but from a dispute as to the validity of votes given in or reported from the States. This difficulty arose

*The first Republican Party is claimed by the present Democratic Party as its progenitor.

Defects.

between Mr. Hayes and Mr. Tilden, disclosing the existence of a set of cases for which the Constitution had not provided. It will not recur in quite the same form, for provision has now been made by statute for dealing with disputed returns. But cases may arise in which the returns from a State of its electoral votes will, because notoriously obtained by fraud or force, fail to be recognized as valid by the party whose candidate they prejudice. No Presidential election passes without charges of this kind, and these charges are not always unfounded. Should manifest unfairness coincide with popular excitement over a really important issue, the self-control of the people, which in 1877, when no such issue was involved, restrained the party passions of their leaders, may prove unequal to the strain of such a crisis."

Another evil which Mr. Bryce refers to in another chapter has been recently much minimized by civil service reform (*q. v.*), but is yet a very great though perhaps to some extent a necessary evil—the presidential appointing power.

It is probably necessary that a president responsible to an extent for the whole federal administration should appoint his own Cabinet and heads of departments, subject to the approval of the Senate, as required by the Constitution; but it is not necessary that these offices should be looked upon as the natural rewards for party service, and that from the day of his election till long after his inauguration the time of a president should be almost wholly occupied by considering rival claims for office. Yet this is the almost inevitable result under the present Constitution, which gives the President so much power—a power far more in many respects than have most European monarchs. Says Mr. Bryce (*idem*, chap. vi.):

"Artemus Ward's description of Abraham Lincoln swept along from room to room in the White House by a rising tide of office seekers is hardly an exaggeration. From the 4th of March, when Mr. Garfield came into power, till he was shot in the July following, he was engaged almost incessantly in questions of patronage. Yet the President's individual judgment has little scope. He must reckon with the Senate; he must requite the supporters of the men to whom he owes his election; he must so distribute places all over the country as to keep the local wire-pullers in good humor, and generally strengthen the party by 'doing something' for those who have worked or will work for it. Altho the minor posts are practically left to the nomination of the Senators or Congressmen from the State or district, conflicting claims give infinite trouble, and the more lucrative offices are numerous enough to make the task of selection laborious as well as thankless and disagreeable. . . . No one has more to gain from a thorough scheme of Civil Service Reform than the President. The present system makes a wire-puller of him. It throws work on him unworthy of a fine intellect, and for which a man of fine intellect may be ill qualified. On the other hand the President's patronage is, in the hands of a skilful intriguer, an engine of far-spreading potency. By it he can oblige a vast number of persons, can bind their interests to his own, can fill important places with the men of his choice. Such authority as he has over the party in Congress, and therefore over the course of legislation; such influence as he exerts on his party in the several States, and therefore over the selection of candidates for Congress, is due to his patronage. Unhappily, the more his patronage is used for these purposes, the more it is apt to be diverted from the aim of providing the country with the best officials."

Professor E. J. James dissents on certain points from the views of Mr. Bryce. He says (*Annals of the American Academy of Political and Social Science*, May, 1896):

"The term 'responsible,' in political science and in constitutional discussions, has come to have a definite technical meaning which makes it improper to use it in describing the relations of the officials in the United States to the people.

"Looking for a moment at the President alone, there is no sense in which the term 'responsible' is used in the discussions of political science in which the President can be fairly said to be responsible to the people at all. He is elected for a period of four years and during that period is as completely and absolutely out of the reach of law and legal process, in his official capacity as President, as even the crowned heads of Europe. It is true that if the President desires to be reelected, he may shape his policy with reference to the impression it will produce upon the voters of the country, or, at least, upon the politicians; but, so the German Emperor, if he desires to secure the passage of a bill through the German legislature, will act in such a way as, in his opinion, will contribute to that end, but he is not for that reason responsible, in any political sense, to the people. Even if the President might be said, in a certain sense, to be responsible in his first term—that is, so far as he may be affected by the desire to influence public sentiment in favor of securing a second term—certainly this cannot be said of his conduct during his second term with reference to a third. He knows full well that no conduct of his would be likely to secure a third term in the present temper and with the present political traditions of the people of the United States.

"No power is given to individual citizens, or to the citizens taken collectively, or to the States individually, or to the States taken together, to control or supervise in any way the acts of the President. He is, so far as any of these elements in our political system are concerned, absolutely irresponsible. Nor can he be reached by any process of the court, and he is, therefore, in this sense, as truly above the courts and free from responsibility to them as any king in Europe. Indeed one may say that in a certain sense the crowned heads of Europe are more immediately responsible to some power outside of themselves than is the President."

Of Mr. Cleveland's bond issues, the *Detroit Tribune* says:

"Until Cleveland proved by trial what a President could do, few persons, doubtless, were aware that money could be borrowed upon the public credit, for the payment of the ordinary expenses of the Government, without consultation of the legislature of the people. It would appear incredible that an intelligent and watchful nation should let its Government get into such shape as that the matter of public expenditure was not controlled by the parliamentary assembly. It was incredible until the object-lessons compelled belief. . . . By the existing law the Executive is given a legal way of getting money without asking the people for it. If that is not a dangerous situation, it will be hard to find dangerous situations."

In the United States discussion as to constitutional reforms in regard to the Presidency have turned mainly upon the method of electing Presidents, their length of term, and their appointing power.

Concerning the method of electing Presidents it is proposed first that the President be elected by direct vote of the people. This is the plan advocated by two out of four contributors to a symposium on the subject in the *North American Review* (vol. cxi. p. 97). It would give every man a chance to express his wish, not compelling him to vote for nominees of a party. It is claimed that it would put the President in closer touch with the people, and make him more independent of party machines; that it would lessen the opportunity for corruption. On the other hand it is argued that, as there would have to be concert of action to elect a candidate, there would be practically no more freedom of personal choice than now, while secret and corrupt concerted action would have more chance. As to the objection that the present electoral system often elects a candidate who has not received the popular majority, it is answered

that a popular majority might often be a sectional majority and not represent the whole country any more truly. It is, therefore, secondly, suggested that the President be elected by the national legislature, as in France.

Mr. D. B. Eaton (*North American Review*, vol. cliv. p. 691) would lengthen the term of office from four to six years, making the elections less frequent, and then forbidding a second term.

Mr. George T. Curtis (*Century*, vol. vii. p. 124) would have the Electoral Commission meet as an electoral chamber, competent to judge of the qualifications and returns of its own members, and then allowing this body to elect the President as responsible men, not as the mere automata of parties.

Mr. Albert Stickney (*A True Republic*, chap. ix.) would make changes in the power to be given the office, and make the President responsible to the legislature, who should have direct power of removing him, without a hearing, if they think public interests demand it, by a two-thirds vote of both Houses sitting as one body. He asks if anyone ever heard of such a thing as insuring efficient work from a man who could not be removed instantly, so soon as, for any reason, he failed to do his work well. Mr. Stickney, through all portions of administrative departments, from the top to the bottom, would give all official responsibility for one work to one man. He would give the President the sole appointing and removing power for all heads of departments and no more. Each department head should be solely responsible for his department, each subordinate head being responsible for those under him; the President, finally, being responsible to the legislature. This system would take from the chief executive any voice in the appointment or removal of the great number of subordinate officials which he now has. It would free him to appoint his department heads without a two-thirds vote of the Senate. For any misconduct or failure he could himself be removed. If not removed, he could hold the office for life.

In the Swiss republic the executive power is not lodged with one man, but in a federal council (Bundesrath), elected for a term of three years by an assembly of the two Houses of legislature sitting together. This assembly also elects the President and Vice-President of the Bundesrath, but the President is given little more power than his colleagues, and can only serve one term. Rotation in the office is rigidly carried out. The main duty of the President, as distinguished from his colleagues, is to represent the Bundesrath and to receive the ministers of foreign powers.

Very many believe that the Presidents of the United States have too much power. At the time of the Pullman strike, when Mr. Cleveland called out the Federal troops to protect the mails, railroads, etc., Governor Altgeld publicly protested against the act; claiming that the State authorities were doing all that was necessary, and that if the President could send troops into a State which had not called for help, it made him a tyrant over the land.

Some radicals believe in the abolition of the Presidency. Says a memorial addressed to Congress:

"1. The Presidency is a copy of royalty: it is an essentially un-republican institution; for it exalts an individual into ruling power over all the rest of the population, bringing them into a relation of subjection toward him, and accustoming them to monarchical ideas.

"2. It is thoroughly anti-democratic in nature; for it does not only ignore the direct authority of the popular will, but opposes an independent and autocratic front to the representative thereof—the legislature.

"3. It maintains the false, illogical, disorganizing theory—born in monarchy, and principally denying democracy—of the 'partition of powers.' In the democratic polity, all powers are derived from the people, and are no more capable of partition from and against each other than are the people. . . .

"4. It is a constantly menacing, constantly growing cause of danger to the republic—whose eventual ruin it must inevitably occasion.

"5. If it do not cause such ruin by direct, violent subversion, it must effect the same through corruption; for the Presidential office is the source, the constantly growing source, of universal corruption. . . .

"To avoid these dangers, the undersigned suggest that Congress propose an Amendment to the Constitution, abolishing the Presidency, and transferring the executive functions to an administrative commission, or Congressional ministry, to be chosen by Congress from their own body, or from among other competent citizens; and to be supervised and instructed, during the adjournment of Congress, by a standing committee, who are to be in permanent session during that time, and who are to be authorized to call extra sessions of Congress when needed."

(See also ELECTIONS; ELECTORAL COLLEGE; CONSTITUTION.)

PRICE.—For a discussion of the important and much debated economic laws which govern price and value, see **VALUE**. For tables of prices, see **PRICES**. The whole subject of price, from the economic standpoint, is so involved with the subject of value that we cannot discuss it advantageously separately from that subject. When we speak of the *price* of an article we popularly mean the amount of money that we have to pay for it in open market; by *value* people usually mean an estimate of a commodity's usefulness or worth. But some economists use the word *value* in the sense not of any *estimate* of worth, but the amount an article will exchange for measured by any standard, while they use the word *price* of the value of a commodity measured by the standard of money. Price is thus a particular case of value, and there is here no distinction between price as a given fact in the market and value as an estimate. Both price and value are facts dependent on intricate laws. The so-called Austrian or psychologic school, which has a large hold in the United States, is differentiated from the orthodox economic school very largely by its concept of value, and the Fabian socialists differ from German socialists on the same point. We give here some representative definitions which show why the subject cannot be separated from that of value. Says Professor Fawcett (*Political Economy*, book iii. chap. i.):

"Price is a particular case of value. If the value of a commodity is estimated by comparing it with those precious metals which civilized countries employ as money, then it is said that the price, and not the value of a commodity, is ascertained."

Says John Stuart Mill (*Political Economy*, book iii. chap. i. § 2):

"The words value and price were used as synonymous by the early political economists, and are not always discriminated even by Ricardo. But the most accurate modern writers, to avoid the wasteful expenditure of two good scientific terms on a single idea, have employed price to express the value of a thing in relation to money; the quantity of money for which it will exchange. By the price of a thing, therefore, we shall henceforth understand its value in money; by the value or exchange value of a thing, its general power of purchasing, the command which its possession gives over purchasable commodities in general."

Says Professor Marshall (*Elements of Economics of Industry*, book i. chap. i. § 5):

"Civilized countries generally adopt gold or silver or both as money. Instead of expressing the values

of lead and tin, and wood and corn, and other things in terms of one another we express them in terms of money in the first instance, and call the value of each thing thus expressed its price. If we know that a ton of lead will exchange for 15 sovereigns at any place and time, while a ton of tin will exchange for 90 sovereigns, we say that their prices then and there are £15 and £90 respectively, and we know that the value of a ton of tin in terms of lead is six tons then and there."

PRICES.—For a discussion of prices, see VALUE. We give here from authoritative sources tables of the rise and fall of prices in recent times. Senate Report No. 1394, second session, Fifty-second Congress, gives the following table of relative prices in gold* for groups of articles in the United States, 1840-91:

YEAR.	GENERAL AVERAGE PRICES.								
	Food.	Cloths and clothing.	Fuel and lighting.	Metals and imple-ments.	Lumber and build-ing materials.	Drugs and chemicals.	House-furnishing goods.	Miscella-neous.	All articles.

* Upland.

For Great Britain, Mr. Angus Sauerbeck, the eminent statistician, gives the following tables quoted in the special publication of the United States Bureau of Statistics for 1895.

MOVEMENTS OF 45 COMMODITIES IN THE UNITED KINGDOM (PRODUCTION AND IMPORTS).

YEARS.	Estimated actual value in each period.	Nominal values at average prices of 1867-77, showing increase in quantities.	Movement of quantities, 1848-50=100.	Movement of quantities from period to period.	Ratio of prices according to this table, 1867-77 = 100.
Average, 1848-50.....	£219,800,000	£294,800,000	100	74.6
1850-61.....	350,100,000	382,700,000	130	30 per cent. over 1849	91.5
1860-71.....	456,600,000	484,600,000	164	27 per cent. over 1850	94.2
1874-76.....	537,800,000	538,400,000	183	99.9
1879-81.....	489,700,000	578,500,000	196	19 per cent. over 1870	84.6
1884-86.....	445,700,000	610,100,000	207	73.0
1889-91.....	504,100,000	685,200,000	233	18 per cent. over 1880	73.6
1892.....	482,900,000	686,500,000	233	70.3
1893.....	445,800,000	655,300,000	223	68.0
1894*.....	448,400,000	696,800,000	236	2 per cent. over 1890	64.3

* 1894 subject to correction after publication of the mineral produce returns.

Mr. Sauerbeck says :

"The nominal values at the uniform prices of 1867-77 show the exact movement of quantities in the aggregate. The quantities have remained practically unchanged on the average of the last six years; during the three years, 1889-91, they were 13 per cent. larger than in 1880, and 133 per cent. larger than in 1849. There was a considerable decrease in 1893, principally owing to diminished supplies of coals and cotton, while the figure for 1894 is barely 2 per cent. higher than in 1889-91. The actual value in 1894 was

less than the average of 1869-71, altho the quantities were 44 per cent. larger."

The following table shows the course of prices of 45 commodities during the last 17 years as compared with the standard period of 18 years, 1867-77, which in the aggregate is equivalent to the average of the 25 years 1853-77 (see the Royal Statistical Society's *Journal*, 1886, pp. 592 and 648, and 1893, pp. 220 and 247):

SUMMARY OF INDEX NUMBERS. GROUPS OF ARTICLES, 1867-77=100.

* Silver 60.84d. per ounce=100.

† Wheat harvest in the United Kingdom, 1878-83, 28 bushels per acre=100; from 1884, 29 bushels=100.

‡ Consols and bank-rate actual figures, not index numbers; consols 2³/₈ per cent. from 1889.

The index number for all commodities was 63, against 68 in 1893, and was therefore 7½ per cent. below the preceding year, 9 per cent. below the average of the preceding 10 years, 20 per cent. below the 10 years 1878-87, and 37 per cent. below the standard period, 1867-77. The decline during the past year extended to all groups of commodities, and in no case was it less than 6 per cent. A number of articles showed records of lowest prices during the century; thus, wheat and flour, oats, rice, sugar, lead, cotton, jute, flax, manila, hemp, merino wool, silk, and soda, in fact, 16 out of 45 descriptions, while some others, such as tea, copper, and petroleum were on the average of the year as low or lower than in any preceding year.

PRIMITIVE PROPERTY.—According to some sociological writers, the present system of private ownership in land was preceded by a system of collective or communal ownership and cultivation. The main authorities for this view are Sir Henry Maine, in his *Ancient Law*; G. L. von Maurer, in his *Einleitung zur Geschichte der Mark, — Hof- Dorf- und Stadtverfassung* (1854); P. Viollet, in his *Bibliothèque de l'École des Chartes* (1872), and Ém. Laveleye, in his *De la Propriété de ses Formes Primitives* (1874), well known to English readers in Marriott's translation, *Primitive Property* (1878). Maine says in the above work (p. 268):

"Property once belonged not to individuals, nor even to isolated families, but to larger societies." Maurer says (p. 93): "All land in the beginning was common land and belonged to all; that is to say, to the people." Viollet says (p. 503): "Land was held in common before it became private property in the hands of a family or an individual." De Laveleye says: "The arable land was cultivated in common; private property grew up afterward out of this ancient common ownership."

Maurer builds his argument from certain expres-

sions in Cæsar, Tacitus, and other Latin authors, and from certain words and phrases like *communio* and *ager publicus* in classic and mediæval formularies, laws, etc. He studies the subject simply in regard to Germanic peoples.

Viollet finds communal property described or referred to among the Greeks and Romans, by Plato, Vergil, Justin, Tibullus, and other writers. He sees a relic of it in the public meals of Sparta, the feasts of the Athenian *prytanes*, and of the Roman *curia*. De Laveleye traces such communal property in the Javan *desa*, the Russian *mir*, the Indian village community, the German *Mark*, the family communities of Bosnia, Servia, Bulgaria, Champagne, and Auvergne, in the Swiss *Allmenden*, the Scotch township, the common lands of France, Belgium, and other countries. De Laveleye does not write as an admirer of the "primitive communism." He argues, in his introduction, that inequality overthrew Greece and Rome and threatens us in still more critical form, and then says: "The object of this book is not to advocate a return to the primitive agrarian community, but to establish historically the natural right of property as claimed by philosophers, as well as to show that ownership has assumed various forms and is consequently susceptible of progressive reform." According to De Laveleye, land was first unappropriated at all. Then certain tribes laid claim to certain portions of territory for grazing purposes. Next, portions began to be claimed for cultivation by the tribe. Then this was parceled out among the families of the tribe for cultivation. Next the parcels were claimed for occupation by patriarchal families. Finally, individual hereditary property appears. **De Laveleye.**

For a discussion of the Russian *mir*, see **MIR**; for the German *Mark*, see **MARK**; for the *Allmend*, see **SWITZERLAND**. Of the Slavic family communities De Laveleye gives a specially interesting account. Under this system land belongs to the *gmina*. (German *Gemeinde*, or commune), which divides the land among the patriarchal families, according to their size. At the head of each family is a *gospodar*. He is elected by the community and transacts its business. He is the executive, but acts only with the advice of the community. The wife of the *gospodar* or some other chosen woman is the *domatchica*, and regulates the domestic interests. The houses cluster around the central house of the *gospodar*. In this house all take their meals. Each community has 20 to 30 persons, and occasionally more. There are usually three generations. When the community becomes too large it divides. The young women usually pass into their husbands' family-community. The fruits of the agricultural labor are usually held in common, but of

industrial labor, individually. Each community owns about 40 acres. The aged and infirm are cared for in common. The women take turns in the common work. Communities aid each other. In the evenings, the community meets for songs and dance. Members are allowed to leave. The system allows of division of labor, union of capital and labor, and simple fraternal life. But it is dying before the forces of self-seeking and western individualism.

Similar communities, De Laveleye says, were developed all through Europe in the Middle Ages, and existed till our own day in Brittany, Auvergne, and various secluded territories.

This view of primitive property in land, however, has been severely criticized by other scholars; notably by Fustel de Coulanges in an essay on *The Origin of Property in Land*, first appearing in the *Revue des Questions Historiques* for April 1889, and translated under the above title by Margaret Ashley (1891).

M. de Coulanges argues that Maurer and Viollet have forced the meaning of the classic authors they quote and that common meals and family communities by no means prove the communal ownership of land. De Coulanges says in summing up his essay (p. 149): "Are we to conclude from all that has gone before that nowhere and at no time was land held in common? By no means. To commit ourselves to so absolute a negative would be to go beyond the purpose of this work. The only conclusion to which we are brought by this prolonged examination of authors, is that community in land has not yet been historically proved."

M. Viollet has not brought forward a single piece of evidence which proves that the great cities ever practised agrarian communism. M. de Jubainville has not brought forward one which proves communism in Gaul. Maurer and Lamprecht have not produced one which shows that the *Mark* was common land. National communism has been confused with the common ownership of the family; tenure in common has been confused with ownership in common; agrarian communism with village commons.

Such are the two opposing schools. Some argue that the correct balance of truth is that property was not originally held either by individuals or communally, but by bodies of men under some "strong man"—despot, tyrant, or at best patriarch. This would be far from communism, but perhaps equally far from individual ownership.

Professor Ch. Letourneau in his *Property and its Origin and Development* (Contemporary Science Series, 1892) finds the origin of property in a biological root, which begins among the animals.

"The instinct of property," he says (p. 2), "is but one of the manifestations of the most primordial of needs—the need of self-preservation, of existing, and securing existence to offspring. The banquet of nature is very irregular, and sometimes very niggardly; the guests are numerous, hungry, and often brutal. Yet, under pain of death, a place must be gained there, defended, and, as far as possible, retained; for continually recurring needs must constantly be satisfied. The severity of the struggle for existence may be greater or less, but it goes on without a truce; therefore the more intelligent the organized being, whether man or animal, the more he takes thought for the future, the more he tries, by securing some sort of property, to reduce the element of chance in his life."

But this may be done in various ways: sometimes selfishly, in isolation, if the individual is gifted enough or well enough armed with force or cunning to suffice unto himself; sometimes collectively, if those concerned are sufficiently intelligent, sufficiently sociable, to supplement their native feebleness by combining, by creating a powerful cluster through the union of small individual energies. These two very different methods of understanding property are found in the animal kingdom, and each of them makes its own mark upon the manners, tendencies, and mentality of the species." Letourneau then goes on to trace the

development of the instinct of property in the animals which lay claim to certain tracts of territory, exactly as do nomadic tribes, or to dens, lairs, or nests, exactly like primitive men. Weaker animals, like bees and ants, have to think of the future. They develop sociability and intelligence, and organize armies and clusters, with officers and laws. From the animal, Letourneau passes to man and finds some men lower than the brute in the instinct of property. He notices the property of anarchic hordes, the savages of Borneo, the Veddahs of Ceylon, the sociability of the Bushmen, the solidarity of the Fuegians, the Australian clans. Among them all property is, as a rule, communal and not private, though the instinct of private property is developing in the private ownership of a weapon or an ornament. Often these are burned or buried with the dead owner. For the property in women, see FAMILY. Among the republican tribes of America, Letourneau finds the same, from the communism of the North American Indian to the developed kingdom of the Incas; see PERU. A step up we come to the monarchic tribes, where despotic heads develop caste and slavery. Here wives are made to toil as the property of the monarchs, and upon fields owned by the monarchs. In New Zealand there were three kinds of proprietors—the tribe, the family, and the individual. In Polynesia, generally, primitive equality has been wholly left behind, and property is owned by chiefs. In Africa the aborigines have developed out of equality, but the degrees are not fixed. In southern Asia we find the Javanese *desa* and Indian communal village. This is perhaps due to the necessity of collective irrigation of rice-fields. In ancient Egypt we have a kingdom something like that of the Incas; all nominally owned by kings, but divided into kings' lands, priests' land, and warriors' lands. Beneath these grades are herdsmen, artisans, and slaves. In China land is nominally owned by the king, but allotted to families. It must be tilled, or can be forfeited. Land is inalienable. Village communities are traceable. In nomadic Arabia, a system of combined individual and communal property exists. Among the Hebrews, land was divided among all, by families. The early Aryan races seem to have practised the village community, and this brings us to historic times.

PRISONERS.—For a study of the sociological questions connected with crime and prisoners, see CRIME; CRIMINAL ANTHROPOLOGY; CRIMINOLOGY. For the treatment of prisoners, see PENOLOGY; CONVICT LABOR; ELMIRA REFORMATORY; JUVENILE REFORMATORIES.

We give here tables of statistics as to the number, distribution, and birthplace of prisoners in the United States, as reported by the census of 1890:

PRISONERS IN THE UNITED STATES IN 1890, CLASSIFIED BY SEX AND BY ELEMENTS OF THE POPULATION.

ELEMENTS.	Aggregate.	Men.	Women.
The United States.....	82,329	75,924	6,405
White	57,310	52,894	4,416
Native	40,471	38,156	2,315
Both parents native.....	21,037	20,101	936
One parent foreign.....	2,881	2,729	152
Both parents foreign.....	12,601	11,766	835
One or both parents unknown.....	3,952	3,560	392
Foreign born.....	15,932	13,869	2,063
Birthplace unknown.....	907	869	38
Colored.....	25,019	23,030	1,989
Negroes.....	24,277	22,305	1,972
Chinese.....	497	406	1
Japanese	13	12	1
Indian.....	322	307	15

As to the nativity of 57,310 white prisoners (52,894 men and 4,416 women), 40,471 (38,156 men and 2,315 women) were born in the United States, 15,932 (13,869 men and 2,063 women) were born abroad, and the birthplace of 907 (869 men and 38 women) is unknown.

Omitting those whose nativity is not given, the percentage of native whites is 71.75, and of foreign whites 28.25.

The Chinese and Japanese were, of course, born abroad, while the negroes and Indians may be supposed to have been born in this country.

Of the 40,471 whites born in the United States, 21,037 (20,101 men and 936 women) had a native father and a native mother, 12,601 (11,766 men and 835 women) had both parents foreign born, 2881 (2729 men and 152 women) had one native and one foreign parent, and the parentage of 3952 (3560 men and 392 women) is unknown as to one or both parents.

Omitting the latter, the percentage of native whites of purely native origin is 57.61; of purely foreign origin, 34.50; and of mixed origin, 7.80.

* Including prisoners "leased," in "military prisons," and in insane asylums.

PRODUCTION may be popularly defined as the creation of wealth. Strictly speaking, production is only the creation of utilities. Man can create no new matter. He can only

move things, and make them useful. This all producers do. The farmer is sometimes considered more really a producer than the manufacturer, but he is not. Both only move

things, and both produce utilities. We can go farther, says Professor Marshall (*Economics of Industry*, p. 57) :

"It is sometimes said that traders do not produce; that while the cabinet-maker produces furniture, the furniture-dealer merely sells what is already produced. But there is no scientific foundation for this distinction. They both produce utilities, and neither of them can do more; the furniture-dealer moves and rearranges matter so as to make it more serviceable than it was before, and the carpenter does nothing more. The sailor or the railway-man who carries coal above ground produces it, just as much as the miner who carries it underground; the dealer in fish helps to move on fish from where it is of comparatively little use to where it is of greater use, and the fisherman does no more. It is true that if there are more traders than are necessary there is waste. But there is also waste if there are two men to a plow which can be well worked by one man; in both cases all those who are at work produce, tho they may produce but little."

Professor Marshall says, elsewhere :

"Productive labor cannot generally be divided off by a clearly defined line from unproductive. A minister of religion is often classed as an unproductive laborer, but if by exerting moral influence he makes laborers more sober, honest, and efficient, he is so far productive of personal wealth. Again, since some recreation is necessary for the highest efficiency of labor, it is quite possible that a musician may indirectly increase the wealth of a nation, and be indirectly productive."

Nevertheless, most economists have undertaken to distinguish between productive and unproductive labor. Says Mill (*Political Economy*, book i. chap. iii. § 1) :

"Labor is indispensable to production, but has not always production for its effect. There is much labor, and of a high order of usefulness, of which production is not the object. Labor has accordingly been distinguished into productive and unproductive. . . .

"Many writers have been unwilling to class any labor as productive, unless its result is palpable in some material object, capable of being transferred from one person to another. There are others (among whom are Mr. McCulloch and M. Say) who, looking upon the word unproductive as a term of disparagement, remonstrate against imposing it upon any labor which is regarded as useful—which produces a benefit or a pleasure worth the cost. The labor of officers of government, of the army and navy, of physicians, lawyers, teachers, musicians, dancers, actors, domestic servants, etc., when they really accomplish what they are paid for, and are not more numerous than is required for its performance, ought not, say these writers, to be 'stigmatized' as unproductive; an expression which they appear to regard as synonymous with wasteful or worthless. But this seems to be a misunderstanding of the matter in dispute. Production not being the sole end of human existence, the term unproductive does not necessarily imply any stigma; nor was ever intended to do so in the present case. The question is one of mere language and classification."

More important is the discussion as to what compose the elements of production. Adam Smith divided the price of commodities and the revenue of the community into the wages of labor, the profits of stock, and the rent of land. J. B. Say, carrying out this idea, divided the requisites of production into labor, land, and capital, and this division ever since has prevailed all but universally. Professor Jevons (*Political Economy Primer*) tells us that there are, as is "commonly and correctly said, three requisites of production; before we can, in the present state of society, undertake to produce wealth, we must have land, labor, capital. In production we bring these things

together; we apply labor to the land, and we employ the capital in assisting the laborer with tools and feeding him while he is engaged on the work."

Nevertheless, all do not agree to this. Some make only labor and land the elements of production. Some say it is only labor that produces wealth. Says John Stuart Mill (*Polit. Econ.*, book i. chap. i. § 1) : "The requisites of production are two, labor and appropriate natural objects." This is the view usually taken by land reformers, and particularly by the advocates of the Single Tax. They do not deny the necessity of capital in production, but they say—correctly, undoubtedly—that capital comes from land, natural opportunities, and labor, so that fundamentally land and labor are the only requisites to production. This is unquestionably true; nevertheless, capital plays such a large and growing part in production, and the laws which govern its action are so different from those that govern the rent of land and the rewards of labor, that most economists, as stated above, believe it wiser to make it a distinct and separate element of production. They claim that while no one denies the fundamental truth that capital comes from human activity applied to natural opportunities, practically the Single-Tax men are led into errors and absurdities due to minimizing the importance of capital. Mill does not. He says (*idem*, book i. chap. iv. § 1) :

"Besides the primary and universal requisites of production, labor, and natural agents, there is another requisite without which no productive operations beyond the rude and scanty beginnings of primitive industry are possible; namely, a stock, previously accumulated, of the products of former labor. This accumulated stock of the produce of labor is termed capital. The function of capital in production it is of the utmost importance thoroughly to understand, since a number of the erroneous notions with which our subject is infested originate in an imperfect and confused apprehension of this point."

The statement sometimes made that labor is the only necessity to production is based on a peculiar use of the word wealth, identifying it with value, and can, therefore, best be discussed under Value (*q. v.*). No one denies that, in order to produce commodities and utilities, it is necessary to have natural objects to work upon.

For a discussion of the different elements entering into production, see LAND; LABOR; CAPITAL.

For the cost of production, see COST OF PRODUCTION.

For development in capacity for production, see PRODUCTIVITY.

PRODUCTIVITY.—General statistical statements as to the present industrial productive power of the world, and especially as to the enormous growth in productive power, have been repeatedly made, but it must be remembered that such statistics are apt to mislead, in regard to particular industries, because of the very great variations in productivity, and particularly, because of the still greater variations in the increase in productivity between industry and industry.

Elements of Production.

The following statement of the steam and water power of the United States, as based upon the census of 1880, appears in the *First Annual Report of the Commissioner of Labor* (1886, p. 87) :

"The mechanical industries of the United States are carried on by steam and water power, representing, in round numbers, 3,500,000 horse-power, each horse-power equaling the muscular labor of 6 men; that is to say, if men were employed to furnish the power to carry on the industries of this country, it would require 21,000,000 men, and 21,000,000 men represent a population, according to the ratio of the census of 1880, of 105,000,000. The industries are now carried on by 4,000,000 persons, in round numbers, representing a population of 20,000,000 only. There are in the United States 28,600 locomotives. To do the work of these locomotives upon the existing common roads of the country, and the equivalent of that which has been done upon the railroads the past year, would require, in round numbers, 54,000,000 horses, and 13,500,000 men. The work is now done, so far as men are concerned, by 250,000, representing a population of 1,250,000, while the population required for the number of men necessary to do the work with horses would be 67,500,000. To do the work, then, now accomplished by power and power machinery in our mechanical industries, and upon our railroads, would require men representing a population of 172,500,000, in addition to the present population of the country of 55,000,000, or a total population, with hand processes and with horse-power, of 227,500,000, which population would be obliged to subsist on present means. In an economic view the cost to the country would be enormous. The present cost of operating the railroads of the country with steam-power is, in round numbers, \$502,600,000 per annum; but to carry on the same amount of work with men and horses would cost \$11,308,500,000."

Mulhall, writing in the *North American Review* for June, 1895, says :

"The working-power of the United States was at various dates approximately as follows :

YEAR.	MILLIONS OF FOOT-TONS DAILY.			
	Hand.	Horse.	Steam.	Total.
1820.....	753	3,300	240	4,293
1840.....	1,406	12,900	3,040	17,346
1860.....	2,805	22,200	14,000	39,005
1880.....	4,450	36,600	36,340	77,390
1885.....	6,406	55,200	67,700	129,306

"The working-power, or number of foot-tons daily per inhabitant, has almost doubled since 1840, and the absolute effective force of the American people is now more than three times what it was in 1860. Of the three great elements of energy above enumerated that which shows the most rapid growth is steam-power, which consists of three classes, viz.:

	HORSE-POWER OF STEAM.			
	1840.	1860.	1880.	1895.
Fixed.....	360,000	800,000	2,186,000	3,940,000
Locomotives...	200,000	1,800,000	5,700,000	10,800,000
Steamboats...	200,000	900,000	1,200,000	2,200,000
Total.....	760,000	3,500,000	9,086,000	16,940,000

"In the above statement, the 'fixed' horse-power employed in mines and factories in 1880 is according to the census returns; the same item cannot be precisely ascertained for the other years, but if it existed in proportion to the number of operatives, as may be fairly supposed, it was as shown above. More than three-fourths of the total steam-power of the Union is employed for traction purposes, on railways and in steamboats, which is not surprising when we remember that the area of activity is as vast as Europe, and that the merchandise transported by rail in the United States is shown by official returns to be double the amount of land-carriage (at least by railway) of all the other nations of the earth collectively. If we would compare the energy or working-power of the United States with that of other nations, the following table would suffice to show it at a glance :

	MILLIONS OF FOOT-TONS DAILY.				FOOT-TONS PER INHABITANT.
	Hand.	Horse.	Steam.	Total.	
Unit'd St'tes	6,406	55,200	67,700	129,306	1,940
Gr't Britain.	3,210	6,100	46,800	56,110	1,470
Germany...	4,280	11,500	29,800	45,580	902
France.....	3,380	9,600	21,600	34,580	910
Austria.....	3,410	9,900	9,200	22,510	560
Italy.....	2,570	4,020	4,800	11,390	380
Spain.....	1,540	5,500	3,600	10,640	590

As to the productivity of agricultural labor in the United States, compared with other countries, Mr. Mulhall (*idem*) gives the following table :

	HANDS EMPLOYED.	TONS OF GRAIN.	TONS OF MEAT.	PRODUCTS PER HAND.	
				Grain, bush.	Meat, lbs.
United States...	8,760,000	76,600,000	4,830,000	350	1,230
United Kingdom.	2,469,000	7,330,000	1,140,000	110	1,090
France....	6,910,000	16,900,000	1,200,000	98	350
Germany...	8,120,000	15,100,000	1,370,000	75	380
Austria...	10,680,000	17,100,000	1,080,000	64	230
Italy.....	5,400,000	5,300,000	360,000	39	150

"An ordinary farm-hand in the United States raises as much grain as three in England, four in France, five in Germany, or six in Austria; which shows that an enormous waste of labor occurs in Europe, because farmers are not possessed of the same mechanical appliances as in the United States."

Edward Atkinson gives the following statements of the industrial productivity of the United States :

"One thousand barrels of flour, the annual rate of 1000 people, can be placed in the city of New York, from a point 1700 or 2000 miles distant, with the exertion of the human labor equivalent to that of only four men, working one year in producing, milling, and moving the wheat. It can then be baked and distributed by the work of three more persons, so that seven persons serve 1000 with bread" (*The Distribution of Products*, p. 15).

The United States.

"The average crop of wheat in the United States and Canada would give one person in every 20 of the population of the globe a barrel of flour in each year, with enough to spare for seed. The land capable of producing wheat is not occupied to anything like one-twentieth of its extent. We can raise grain enough on a small part of the territory of the United States to feed the world" (*Distribution of Products*, p. 22).

"The general conclusion at which I have arrived is that in the year 1880, the census year, when the population of the United States numbered a little over 50,000,000, the annual product had a value of nearly, or quite \$10,000,000,000, at the points of final consumption, including, at market-prices, that portion which was consumed upon the farm, but which was never sold. Omitting that consumed upon the farm, it was about \$9,000,000,000" (*Distribution of Products*, p. 27).

"At an average of 200 pounds per head in the United States, the largest consumption of iron of any nation, we may yet find that the equivalent of one man's work for one year, divided between the coal-mine, the iron-mine, and the iron furnace, suffices for the supply of 500 persons. One operator in the cotton factory makes cloth for 250; in the woolen factory for 300; one modern cobbler (who is anything but a cobbler), working in a boot and shoe factory, furnishes 1000 men, or more than 1000 women, with all the boots and shoes they require for a year" (*Distribution of Products*, pp. 77-78).

Of the comparative industrial productivity of the workmen in various countries, various calculations have been made.

Dr. Schulze-Gaevernitz (*Der Grossbetrieb*,

p. 151) gives the following comparison between Switzerland and Germany, England, and America as regards weaving :

	Weekly product per worker.	Cost per yard.	Hours of labor.	Weekly wage.	
	Yards.			s.	d.
Switzerland and Germany.....	466	0.303	12	11	8
England.....	706	0.275	9	16	3
America.....	1200	0.2	10	20	3

It will be noted that while wages in America are higher than elsewhere, they are not so much higher as the productivity of their labor exceeds that of other workmen. Mr. Hobson says upon this point (*Evolution of Modern Capitalism*, p. 277) :

"Tho it may be better for a weaver to tend four looms during the English factory day for the moderate wage of 16s. a week than to earn 11s. 8d. by tending two looms in Germany for 12 hours a day, it does not follow that it is better to earn 20s. 1d. in America by tending six, seven, or even eight looms for a ten-hours' day, or that the American's condition would be improved if the eight-hours' day was purchased at the expense of adding another loom for each worker.

"The gain which accrues from high wages and a larger amount of leisure, over which the higher consumption shall be spread, may be more than counteracted by an undue strain upon the nerves or muscles during the shorter day. This difficulty, as we have seen, is not adequately met by assigning the heavier muscular work more and more to machinery, if the possible activity of this same machinery is made a pretext for forcing the pace of such work as devolves upon machine tenders."

Of another line of production, the *Sixth Annual Report of the Commissioner of Labor* (1890, pp. 590-591) says :

"The preceding tables also show quite clearly the variation in efficiency between different localities. In pig-iron in the northern district of the United States 43 of the 45 establishments have an efficiency of .08 of a ton or more, one ranging as high as .16 and under .17, 34 being concentrated in the four groups that begin with .08 and end under .12; while in the southern district of the United States 14 of the 21 have an efficiency under .08, and of the seven above this figure five are under .10. In the northern district for those of .08 and above, the average earnings per man per hour ranges from 14.1 cents to 18.7, increasing quite generally with the increase of efficiency, while those below .08 have earnings from 11.1 cents to 12.8. In the southern district the tendency of efficiency and earnings to move together is not so marked, tho the two most efficient have earnings above the average. In Great Britain three establishments are given, two of which have a high efficiency, both being between .12 and .14 tons and accompanied by earnings of 9 and 10 cents, while the remaining one, with an efficiency between .07 and .08 tons, has earnings of but 5.8 cents. The five establishments for the continent of Europe have an efficiency rather lower than the northern district of the United States, agreeing, perhaps, more nearly with the southern. No connection between efficiency and earnings is traceable in them. In muck bar iron the United States, Great Britain, and the continent of Europe are about on a par as to efficiency, tho the number of establishments from the foreign countries is too few for an emphatic conclusion. The connection with earnings is here readily apparent. In steel ingots five of the seven United States establishments have an efficiency between .10 and .13 tons, three being in the group of .12 and under .13, the same position as is occupied by one of the two for Great Britain and one of the three for the continent of Europe. The remaining three for the foreign countries stand very low in the scale, being under .07 tons, a position occupied by only one of the seven United States establishments. High earnings

are here also generally found with high efficiency. For steel rails the United States is represented by two concerns, the continent of Europe by five, and Great Britain by one. The difference in efficiency here is very marked. The two for the United States have an efficiency equal to between .12 and .13 tons of product per man per hour, and the five for the continent of Europe all fall under .06 tons, ranging down even to under .02 tons, while the single establishment for Great Britain shows an efficiency of between .08 and .09 of a ton. No connection between high productive power and high wages is apparent."

Mr. E. R. L. Gould, speaking of wages and productivity in the manufacture of bar iron in the United States (*Contemporary Review*, January, 1893), says :

"The wages of such skilled workmen as beaters and rollers are twice as great as in Great Britain and nearly threefold higher than in France and Belgium. The average wage to all classes of laborers in the establishment is also twice as great as in Great Britain, three times as high as in France, and four times larger than in Belgium. Compare these figures with the labor cost of a similar unit of manufacture and we find quite different proportions. It is only a trifle more than in France, where daily wages are about one-third as high; one-eighth dearer than in Great Britain, with wages only half as high, and 54 per cent. greater than in Belgium, where wages are down to one-fourth. In the manufacture of steel rails the same general law is evident. With the average wage of the establishment 40 per cent. greater than in England, the labor cost is only 10 per cent. more. In comparison with the continent of Europe wages are 90 per cent. and labor cost but 50 per cent. higher. We must note also that for bar iron the proportion of the labor cost to the total cost is less in the United States than in Great Britain and France, and for steel rails less than in England. What inferences are we to draw from the foregoing statistics? Unmistakably this, that higher daily wages in America do not mean a correspondingly enhanced labor cost to the manufacturer. But how so? Some say because of the more perfect mechanical agencies put into the hands of the workman in American rolling-mills. There is reason in this answer if we take the average conditions, but it does not represent the whole truth. Moreover, it cannot be used in a comparison between England and the United States, since in the former country mechanical processes have been perfected almost to the same degree as in the latter. . . . The real explanation I believe to be that greater physical force, as the result of better nourishment, in combination with superior intelligence and skill, make the working man in the United States more efficient. His determination to maintain a high standard of life causes him to put forth greater effort, and this reacts to the benefit of the employer as well as to his own. We should give the principal credit of the higher wage in America neither to the manufacturer, the tariff, nor any other agency but the working man himself, who will not labor for less than will enable him to live on a high social plane. That he can carry out his policy with little disadvantage to his employer in economic competition teaches a lesson of far-reaching importance. . . . There is one consideration we must not overlook. The American may not always equal the naturalized European in physical power, but he greatly surpasses him in nerve force. . . . It is a fact of common experience in the United States that, in a machine shop, for example, three-fourths of the fitters will be foreign born, while among the machinists 75 per cent. will be native Americans."

Of the recent development of industrial power, Mr. J. A. Hobson says (*Evolution of Modern Capitalism*, pp. 171-173) :

"The earlier inventions in the textile industries, and the general application of steam to manufacture, and to the transport services, have played the most dramatic part in the industrial revolution of the last hundred years. But it should be borne in mind that it is far from being true that the great forces of invention have spent themselves, and that we have come to an era of small increments in the growth of productive power. On the contrary, within this last generation, a number of discoveries have taken place in almost all the chief industrial arts, in the opening up

Comparative Productivity.

of new supplies of raw material, and in the improvement of industrial organization, which have registered enormous advances of productive power. In the United States, where the advance has been most marked, it is estimated that in the 15 or 20 years preceding 1886, the gain of machinery, as measured by 'displacement of the muscular labor,' amounts to more than one-third; taking the aggregate of manufactures into account. In many manufactures the introduction of steam-driven machinery and the factory system belongs to this generation. The substitution of machinery for hand labor in boot-making signifies a gain of 80 per cent. for some classes of goods; 50 per cent. for others. In the silk manufacture there has been a gain of 50 per cent.; in furniture some 30 per cent.; while in many minor processes, such as wood-planing, tin cans, wall-papers, soap, patent leather, etc., the improvement of mechanical productiveness per laborer is measured as a rise of from 50 to 300 per cent., or more. The gain is, however, by no means confined to an extension of 'power' into processes formerly produced by human muscle and skill. Still more significant is the increased mechanical efficiency in the foundational industries. In the manufacture of agricultural implements, the increase is put down at from 50 to 70 per cent.; in the manufacture of machines and machinery, from 25 to 40 per cent.; while 'in the production of metals and metallic goods, long-established firms testify that machinery has decreased manual labor 33 1/3 per cent.' The increase in the productive power of cotton mills is far greater than this. From 1870 to 1884 the make of pig-iron rose 131 per cent. in Great Britain, and 237 per cent. in the rest of the world. 'In building vessels an approximate idea of the relative labor displacement is given as 4 or 5 to 1; that is, four or five times the amount of labor can be performed to-day by the use of machinery in a given time that could be done under old hand methods.'

Increase of Productivity.

"In England the rise in productiveness of machinery is roughly estimated at 40 per cent. in the period 1850 to 1885, and there is no reason to suppose this is an excessive estimate. In the shipping industry, where more exact statistics are available, the advance is even greater. The diminution of manual labor required to do a given quantity of work in 1884, as compared with 1870, is put down at no less than 70 per cent.; owing in large measure to the introduction and increased application of steam-hoisting machines and grain elevators, and the employment of steam-power in steering, raising the sails and anchors, pumping, and discharging cargoes. In the construction of ships enormous economies have taken place. A ship which in 1883 cost £24,000, can now be built for £14,000. In the working of vessels the economy of fuel, due to the introduction of compound engines, has been very large. A ton of wheat can now be hauled by sea at less than a farthing per mile. Similarly with land haulage the economy of fuel has made immense reductions in cost. 'In an experiment lately made on the London and North Western Railway, a compound locomotive dragged a ton of goods for one mile by the combustion of two ounces of coal.'

Of the relation between productivity and wages, Dr. Schulze-Gaevernitz (*Der Grossbetrieb*, p. 132) gives the following tables, taking the spinning and weaving industries as wholes in England :

SPINNING.

	Product of yarn in 1000 lbs.	Number of workers in spinning mills.	Product per worker in lbs.	Cost of labor per lb.	Average yearly wages.
1819-21.....	106,500	111,000	968	6 d.	26 13 0
1829-31.....	216,500	140,000	1546	4 2	27 6 0
1844-46.....	523,300	190,000	2754	2 3	28 12 0
1859-61.....	910,000	248,000	3671	2 1	32 10 0
1880-82.....	1,324,000	240,000	5520	1 9	44 4 0*

WEAVING.

	Product in 1000 lbs.	Number of workers.	Product per worker in lbs.	Cost of labor per lb.	Average yearly income.
1819-21.....	80,620	250,000	322	5 s. 15 d.	20 18 0
1829-31.....	143,200	275,000	521	9 0	19 18 0†
1844-46.....	348,110	210,000	1658	3 5	24 10 0
1859-61.....	650,870	203,000	3206	2 9	30 15 0
1880-82.....	993,540	246,000	4039	2 3	39 0 0

* *Der Grossbetrieb*, p. 132. In regarding the advance of recent average wages it should be borne in mind that the later years contain a larger proportion of adults. In considering the net yearly wages, a deduction for unemployment should be made from the sums named in the table.

† Account must be taken of the depressed condition of hand-loom weavers, who had not yet disappeared.

The same holds good of the growth of the cotton-weaving industry in America, as the following table shows :

	Yearly product per worker.	Cost of labor per yard.	Yearly earnings per worker.
	<i>Yards.</i>	<i>Cents.</i>	<i>Dollars.</i>
1830.....	4,321	1.9	164
1850.....	12,164	1.55	190
1870.....	19,293	1.24	240
1884.....	28,032	1.07	290

(See also WEALTH ; MANUFACTURES.)

PROFIT.—The word profit is used in political economy by different writers in different senses. It is not at all difficult to understand its different uses, but great care must be taken to be sure that one knows the sense in which an author uses it, before one can judge or understand the meaning. The failure to do this has led to endless popular confusion, and not seldom to inaccurate statements by economists themselves.

Adam Smith defines it as "the revenue derived from stock (capital) by the person who manages or employs it" (*Wealth of Nations*, i. 7). Mill defines it (*Polit. Econ.*, chap. xv. § 1) as "the gains of the person who advances the expenses of production—who, from funds in his possession, pays the wages of the laborers, or supports them during the work, who supplies the requisite buildings, materials, and tools, or machinery; and to whom, by the usual terms of the contract, the produce belongs, to be disposed of at his pleasure."

Jevons (*Primer of Political Economy*, p. 52) uses it of wages of superintendence, interest, and recompense for risk. He says :

"The proper share of the capitalist is interest; but this is usually a good deal less than what actually remains in the hands of the capitalist. Business is generally carried on by some capitalist who rents a piece of land, builds a factory, purchases machinery, and then employs men to work the machinery, paying them wages. The capitalist himself often acts as manager, and works every day almost as long as the workmen. When the goods are finished and sold, he keeps the whole of the money he gets for them; but then he has already paid out a large sum as wages, while the goods were being made; another part goes to

pay the rent of the land which he has hired. Having struck off these portions, there ought to remain a certain profit, part of which he uses to live upon. But even this profit consists of more than interest upon his capital. It should include also a payment for his labor in superintending the business. The manager

What Profit Is.

of a factory may seldom touch the cotton, flax, iron, or other material, which is manufactured; nevertheless, he works with his head and his pen, calculating the prices at which he can produce goods, inquiring where he can buy the materials most cheaply, choosing good workmen, keeping the accounts straight, and so on. Severe mental labor is really far more difficult and exhausting than manual labor; and in raising up a good business, and carrying it through times of danger, a manager has to undergo great anxiety and mental fatigue. Thus, it is necessary that a successful manager should receive a considerable share of the produce, so as to make it worth his while to give this labor. His share is called the wages of superintendence, and, although usually much larger than the share of a common laborer, it is really wages of the same nature.

"Another part of the capitalist's so-called profit ought to be laid aside as recompense for risk. There is always more or less uncertainty in trade, and even the most skillful and careful manager may lose money by circumstances over which he has no control. Sometimes, after building a factory, the demand for the goods which he is going to produce falls off; sometimes the materials cannot be bought; perhaps it is discovered, when too late, that the factory has been built in an unsuitable place; occasionally, too, the workmen are discontented, and refuse to work for such wages as the capitalist can afford to pay. Now, whenever any of these mistakes or misfortunes happen, it is the capitalist who mainly suffers, because he loses a great deal of money, on which he might otherwise have lived comfortably."

Professor Ely uses the word to exclude interest and wages of superintendence. He says (*Political Economy*, p. 217, first ed.):

"Whatever is left after paying interest, rent, and wages is profits. It is the return which is received for the organization and management of a business at one's risk. It is, strictly speaking, not 'wages of superintendence,' for that may be deducted, and often is deducted."

Profits then may be considered (1) to be what the stockholders or owners of a business receive after those who manage the business have received their "wages of management," after the capital invested or borrowed has received its due interest, and after payment has been made for risk; or (2) profit may be used in a larger sense to include one or more of all these items.

Of the law which governs profits we have many statements. John Stuart Mill says (*Political Economy*, fifth London edition, book ii, chap. xv.):

"The lowest rate of profit which can permanently exist is that which is barely adequate, at the given place and time, to afford an equivalent for the abstinence, risk, and exertion implied in the employment of capital. From the gross profit has first to be deducted as much as will form a fund sufficient on the average to cover all losses incident to the employment.

Law of Profits.

Next, it must afford such an equivalent to the owner of the capital for forbearing to consume it, as is then and there a sufficient motive to him to persist in his abstinence. How much will be required to form this equivalent depends on the comparative value placed, in the given society, upon the present and the future: (in the words formerly used) on the strength of the effective desire of accumulation. Further, after covering all losses, and remunerating the owner for forbearing to consume, there must be something left to recompense the labor and skill of the person who devotes his time to the business. This recompense, too, must be sufficient to enable at least the owners of the large capitals to receive for their trouble, or to pay to some manager for his, what to them or him will be

a sufficient inducement for undergoing it. . . . If the surplus is no more than this, none but large masses of capital will be employed productively, and if it did not even amount to this, capital would be withdrawn from production and unproductively consumed, until, by an indirect consequence of its diminished amount, to be explained hereafter, the rate of profit was raised.

"Such, then, is the minimum of profits; but that minimum is exceedingly variable, and at some times and places extremely low; on account of the great variableness of two out of its three elements. That the rate of necessary remuneration for abstinence, or, in other words, the effective desire of accumulation, differs widely in different states of society and civilization. . . . There is a still wider difference in the element which consists in compensation for risk. I am not now speaking of the differences in point of risk between different employments of capital in the same society, but of the very different degrees of security of property in different states of society.

"The remuneration of capital in different employments, much more than the remuneration of labor, varies according to the circumstances which render one employment more attractive, or more repulsive, than another. The profits, for example, of retail trade, in proportion to the capital employed, exceed those of wholesale dealers or manufacturers, for this reason among others, that there is less consideration attached to the employment. The greatest, however, of these differences is that caused by difference of risk. The profits of a gunpowder manufacturer must be considerably greater than the average, to make up for the peculiar risks to which he and his property are constantly exposed. . . .

"The portion, too, of the gross profit which forms the remuneration for the labor and skill of the dealer or producer, is very different in different employments. This is the explanation always given of the extraordinary rate of apothecaries' profit; the greatest part, as Adam Smith observes, being frequently no more than the reasonable wages of professional attendance. . . .

"But the profits thus vary, the parity, on the whole, of different modes of employing capital (in the absence of any natural or artificial monopoly) is, in a certain, and a very important sense, maintained. On an average (whatever may be the occasional fluctuations), the various employments of capital are on such a footing as to hold out, not equal profits, but equal expectations of profit, to persons of average abilities and advantages. By equal, I mean after making compensation for any inferiority in the agreeableness or safety of an employment. If the case were not so, if there were evidently, and to common experience, more favorable chances of pecuniary success in one business than in others, more persons would engage their capital in the business, or would bring up their sons to it. The expectations of profit, therefore, in different employments, cannot long continue very different; they tend to a common average, tho they are generally oscillating from one side to the other side of the medium."

Representing much later and, at present, far more generally accepted thought, Professor Marshall says (*Economics of Industry*, book vi, chap. viii.):

"The profits of a business are the excess of its receipts over its outgoings, and the annual rate of profits is the ratio which the yearly profits bear to the capital invested. We have next to inquire whether there is any general tendency of the rate of profits to equality.

"The first difficulty arises from the fact that the outgoings of a business, and therefore its profits, are not always estimated in the same way. This was well pointed out by Adam Smith, who said: 'The whole drugs which the best employed apothecary in a large market-town will sell in a year may not perhaps cost him above thirty or forty pounds. Tho he should sell them, therefore, for three or four hundred or a thousand per cent. profit, this may frequently be no more than the reasonable wages of his labor in the only way in which he can charge them, upon the price of the drugs. The greater part of the apparent profit is real wages disguised in the garb of profit. In a small seaport town a little grocer will make 40 or 50 per cent upon a stock of a single hundred pounds, while a considerable wholesale mer-

Professor
Marshall's
View.

chant in the same place would scarce make 8 or 10 per cent. upon a stock of ten thousand.'

"The greater part of the nominal inequality between the normal rates of profit in small businesses and in large would disappear if the scope of the term profits were narrowed in the former case or widened in the latter, so that it included in both cases the remuneration of the same classes of services. There are even reasons for thinking that the rate of profit, rightly estimated, on large capitals tends to be higher than on small. For of two businesses competing in the same trade, that with the larger capital can nearly always buy at a cheaper rate, and can avail itself of many economies in the specialization of skill and machinery and in other ways, which are out of the reach of the smaller business; while at most the only important advantage which the latter is likely to have consists of its greater facilities for getting near its customers and consulting their individual wants. In trades in which this last advantage is not important, and especially in some manufacturing trades in which the large firm can sell at a better price than the small one, the outgoings of the former are proportionately less and the incomings larger; and, therefore, if the profits be reckoned in the same way in both cases, the rate of profits in the former case must be higher than in the latter.

"But these are the very businesses in which it most frequently happens that large firms, after first crushing out smaller ones, either combine with one another and thus secure for themselves the gains of a limited monopoly, or by keen competition among themselves reduce the rate of profit very low. There are many branches of the textile, the metal, and the transport trades in which no business can be started at all except with a large capital; while those that are begun on a moderate scale struggle through great difficulties, in the hope that, after a time, it may be possible to find employment for a large capital, which will yield earnings of management high in the aggregate, the low in proportion to the capital.

"There are some trades which require a very high order of ability, but in which it is nearly as easy to manage a very large business as one of moderate size. In rolling-mills, for instance, there is little detail which cannot be reduced to routine, and a capital of £1,000,000 invested in them can be controlled by one able man. A rate of profits of 20 per cent., which is not a very high average rate for some parts of the iron trade, would give the owner of such works earnings of management amounting to more than £150,000 a year. And since iron-masters can with so little additional effort get the earnings of management on an increased capital, wealthy men remain in the trade longer than in most others; and the competition of the great iron-masters with one another is said to have reduced the average rate of profits in the trade below the ordinary level.

"The rate of profits is low in nearly all those trades which require very little ability of the highest order, and in which a public or private firm with a good connection and a large capital can hold its own against newcomers, so long as it is managed by men of industrious habits and sound common sense and a moderate share of enterprise. And men of this kind are seldom wanting either to a well-established public company or to a private firm which is ready to take the ablest of its servants into partnership.

"We may then conclude, firstly, that the true rate of profits in large businesses is higher than at first sight appears, because much that is commonly counted as profits in the small business ought to be classed under another head.

"Profits are exceptionally high where the wages bill is very large, relatively to the capital. . . . The least inaccurate of all the broad statements that can be made with regard to a general tendency of profits to equality in different trades, is that where equal capitals are employed, profits tend to be a certain percentage per annum on the total capital, together with a certain percentage on the wages bill. . . .

"It is obvious that wholesale dealers, who buy and sell large quantities of produce in single transactions,

and who are able to turn over their capital very rapidly, may make large fortunes, tho their average profits on the turnover are less than 1 per cent.; and, in the extreme case of large stock exchange dealings, even when they are

only a small fraction of 1 per cent. But a shipbuilder, who has to put labor and material into the ship, and to provide a berth for it, a long while before it is ready to sail, and who has to take care for every detail con-

nected with it, must add a very high percentage to his direct and indirect outlay in order to remunerate him for his labor and the locking up of his capital.

"Again, in the textile industries, some firms buy raw material and turn out finished goods, while others confine themselves to spinning, to weaving, or to finishing; and it is obvious that the rate of profit on the turnover of one of the first class must be equal to the sum of the rates of profit of one of each of the three other classes. Again, the retail dealers' profit on the turnover is often only 5 or 10 per cent. for commodities which are in general demand, and which are not subject to changes of fashion; so that, while the sales are large, the necessary stocks are small, and the capital invested in them can be turned over very rapidly, with very little trouble and no risk. But a profit on the turnover of nearly 100 per cent. is required to remunerate the retailer of some kinds of fancy goods which can be sold but slowly, of which varied stocks must be kept, which require a large space for their display, and which a change of fashion may render unsalable except at a loss; and even this high rate is often exceeded in the case of fish, fruit, flowers, and vegetables.

"To pass to another point, the number of those who succeed in business is but a small percentage of the whole; and in their hands are concentrated the fortunes of others several times as numerous as themselves, who have made savings of their own, or who have inherited the savings of others and lost them all, together with the fruits of their own efforts, in unsuccessful business. In order, therefore, to find the average profits of a trade we must not divide the aggregate profits made in it by the number of those who are reaping them, nor even by that number added to the number who have failed; but from the aggregate profits of the successful we must subtract the aggregate losses of those who have failed, and perhaps disappeared from the trade; and we must then divide the remainder by the sum of the numbers of those who have succeeded and those who have failed. It is probable that the true gross earnings of management—that is, the excess of profits over interest—is not on the average more than a half, and in some risky trades not more than a tenth part, of what it appears to be to persons who form their estimate of the profitableness of a trade by observation only of those who have secured its prizes. There are, however, reasons for thinking that the risks of trade are on the whole diminishing rather than increasing."

John Stuart Mill adds an important point. He says (*Political Economy*, book ii. chap. xv. § 5):

"To popular apprehension it seems as if the profits of business depended upon prices. A producer or dealer seems to obtain his profits by selling his commodity for more than it cost him. Profit altogether, people are apt to think, is a consequence of purchase and sale. It is only (they suppose) because there are purchasers for a commodity, that the producer of it is able to make any profit. Demand—customers—a market for the commodity, are the cause of the gains of capitalists. It is by the sale of their goods that they replace their capital and add to its amount.

"This, however, is looking only at the outside surface of the economic machinery of society. In no case, we find, is the mere money which passes from one person to another the fundamental matter in any economical phenomenon. If we look more narrowly into the operations of the producer, we shall perceive that the money he obtains for his commodity is not the cause of his having a profit, but only the mode in which his profit is paid to him.

"The cause of profit is that labor produces more than is required for its support. The reason why agricultural capital yields a profit is because human beings can grow more food than is necessary to feed them while it is being grown, including the time occupied in constructing the tools and making all other needful preparations; from which it is a consequence that, if a capitalist undertakes to feed the laborers on condition of receiving the produce, he has some of it remaining for himself after replacing his advances. To vary the form of the theorem: the reason why capital yields a profit is because food, clothing, materials, and tools last longer than the time which was required to produce them; so that if a capitalist supplies a party of laborers with these things, on condition of receiving all they produce, they will, in addition to reproducing

**Labor, the
Source of
Profit.**

Variations.

their own necessities and instruments, have a portion of their time remaining, to work for the capitalist. We thus see that profit arises, not from the incident of exchange, but from the productive power of labor; and the general profit of the country is always what the productive power of labor makes it, whether any exchange takes place or not. If there were no division of employments, there would be no buying or selling, but there would still be profit. If the laborers of the country collectively produce 20 per cent. more than their wages, profits will be 20 per cent. whatever prices may or may not be. The accidents of price may for a time make one set of producers get more than 20 per cent., and another less; the one commodity being rated above its natural value in relation to other commodities, and the other below, until prices have again adjusted themselves; but there will always be just 20 per cent. divided among them all."

All economists, however, do not agree with Mill that the cause of profit is that labor produces more than is required for its support. They deny the fact. Mr. Edward Atkinson, *e. g.*, argues that capital is as necessary to labor as labor to capital. He says (*The Industrial Progress of the Nation*, p. 147):

"Many an honest workmen now sincerely contests the equity of distribution by way of capitalists. What is the true answer? There is and there can be, but one reply to this question.

Part Played by Capital. Labor does not produce the entire product; it only shares in the work as it shares in the product. Without capital labor alone would be almost incapable of sustaining those who constitute the mere working classes in the narrowest sense. Capital is a force, and capitalists are those who direct this force. By the direction which the owners or the administrators of capital give to this force, which requires mental work of the most uncommon kind, the joint product of labor and capital is so much increased that even though the capitalist secures to his own use a large part of the joint product, what is left to the working man is more in quantity and in value than he could otherwise have attained by his own unaided efforts."

Mr. Atkinson says elsewhere (*The Distribution of Profits*, p. 38): "The late Cornelius Vanderbilt may be taken as an example of a communist in a true sense. He was the greatest communist of his age. He consolidated and perfected the railroad service in such a way that a year's supply of meat and bread can be moved one thousand miles from the Western prairies to the Eastern workshop at the measure of cost of a single day's wages of a mechanic or artisan in Massachusetts."

Says Mr. George Gunton (*Wealth and Progress*, chap. 1):

"The idea most prevalent, indeed, well-nigh universal, among working men regarding the production of wealth, to use the official language of the largest labor organization in the world,* is: (1) That labor creates all wealth. (2) That all wealth belongs to those who create it. From this it manifestly follows that all wealth rightfully belongs to the laborer. Hence, all who obtain wealth without his consent do so by cheating him out of the product of his labor, and are thieves and robbers.

"This is not merely the official dogma of a single society, but it constitutes the basis of nearly every proposition and the essence of nearly all economic literature put forth in the name of industrial and social reform. With financial reformers the robbery is labelled 'interest and usury'; with land reformers it is 'rent,' and with the socialists, in the language of their own economist, Karl Marx, it is 'surplus value,' which is more sweeping than any of the others, and includes all rents, profits, and interest.

"If this formula is correct, and all profits, interest, rents, etc., are 'exploitation'—mere plunder of the laborer—clearly the working men would be justified in using any means within their power to take possession of all the wealth in the community, as many of their leaders are expecting them some day to do.

* *Polity of the Labor Movement*, vol. i. p. 4, published by the Knights of Labor, 1885.

[The society to-day is very much reduced in size.—ED.]

"But is it correct? If the first proposition is true, the balance of the formula is indisputable; but if it is not true, then the whole fabric falls, and all efforts at social reformation based upon it must surely fail to produce the desired and expected result.

"A very little reflection will suffice to show that this proposition, while seemingly true, is essentially false. . . . There are clearly two sets of forces or two kinds of motor power that can be employed in producing wealth. One is labor power engendered and put forth by human beings; the other is natural power engendered and put forth by material objects, as capital (machinery, etc.). The former is slow, clumsy, and ineffectual, and capable of very little increase, while the latter is rapid, exact, and powerful, and is capable of indefinite increase.

"Accordingly, in proportion as wealth is produced by human labor is it scant and dear, and the masses are poor and barbarous; and according as it is produced by natural forces (steam, etc.) it is abundant and cheap, and the masses are materially prosperous and socially civilized. Thus, *e. g.*, in India, where wealth is produced mainly by human labor, the annual earnings are about £2 (\$10)* per capita of the population as against £33 (\$165) per capita in this country, where human labor supplies the smallest per cent. of the productive power of any country in the world.† The same is true of other countries.

"Hence we find that in England over 78 per cent. of the productive power is furnished by steam, as against 10 per cent. in Russia. In Spain, 24; Italy, 34, and Portugal, 42 per cent. of the productive power is furnished by human labor, as against 4 per cent. in England and America.

"In consequence of this difference in the use of natural and human forces in production, Mulhall tells us‡ that the united industrial power of six Englishmen and six Americans is equal to that of 24 Frenchmen or Germans, 32 Austrians, 50 Spaniards, 75 Italians, or 84 Portuguese." Accordingly we find the general rate of wages in England is nearly twice, and in this country three times that of the average in Continental countries.

"It is thus clear that the laborer is not robbed by capital, but that he always gains by the use of capital, not because of any generosity on the part of the capitalist, but by the inexorable operation of economic law, which prohibits the use of capital except upon the condition that it will yield increasing returns—in other words, that it will give more wealth to the community than it takes from it.

"Were this otherwise, social progress would be impossible, as the productive power of the human hand cannot, to any great extent, be increased. Hence, unless some other forces can be harnessed to the production of wealth, man would be doomed to eternal poverty and barbarism, as he has been for ages in those countries where natural forces (machinery) have not—except to the most limited extent—been employed. In short, it is only as capital produces more than it consumes that the laborer is enabled to consume more than he produces, and social progress becomes possible.

"It is, therefore, clear that human labor does not, except under the most primitive state of savagery, 'create all wealth,' and that the social condition of the laborer is not necessarily the best when he gets the whole product; but, on the contrary, wealth is produced by the combined effort of labor and capital, and that, according as the proportion of the total wealth produced by human labor diminishes, the actual amount the laborer receives increases."

The above quotations are given, not by any means as the last word upon the subject, but simply to show the important part played in production by capital, and therefore, if capital can only be gotten by giving it profits, the necessity and justice of paying the capitalist sufficient interest or profit. Even those who assert that labor produces all wealth do not deny this. (For a full discussion of their position, see VALUE.) They simply argue that under a cooperative civiliza-

Use of
Capital.

Socialist
View.

* See Mulhall's *Progress of the World*, p. 42.

† *Ibid.*, *History of Prices*, p. 53.

‡ *History of Prices*, p. 54.

tion capital will be furnished either by the community (under socialism) or by cooperating workmen (under an individualistic system), and that hence, when wages and profits are paid to the same persons, profits can become nil and wages all, and still the members of the community be willing and able to furnish the necessary capital. Most Fabian socialists do not hold that labor produces all wealth. They argue that wealth comes from land, labor, and capital. They agree, however, with the Marxian socialists that labor should get all the wealth, because they believe that all men should labor, and that it is neither wise nor just that one class in the community should own the land and capital and be paid for their use, and another class furnish the labor and be paid for their work. They would have the same men and women (the whole community) own the capital and land and furnish the labor, and so receive the whole product. The socialist's and the working man's quarrel is not with capital, but with the capitalist; that is, with the wage system where one class does the work and another class furnishes the capital.

Already the share that goes to capital as a whole is falling, even tho, by concentration, a few capitalists are gaining enormous wealth. The profits on capital may fall so low as to fail to induce men to furnish capital or allow them to live on the returns to capital; then a cooperative system will become necessary, or the whole community be compelled to work and be paid by a few successful capitalists who will get enormous returns, at very low rates, from still more enormous investments.

That the rate of profits is falling is not denied. Says Professor Marshall (*Economics of Industry*, book ii. chap. xii. §§ 7-8):

"The total amount of the earnings of management got by business men in a country may be found by subtracting interest on the whole amount of their own capital from their total net incomes after allowing for all expenses and losses; and, even after allowance has been made for insurance against personal risks, this amount certainly gives a very high rate of wage for the skill and ability of business men.

But this rate is not so high as at first sight appears; for great deductions must be made on account of those who have lost their capital in trade. The earnings of the labor that these men have wasted, together with all the capital that they have lost, must be deducted from the earnings of management got by successful men before the average earnings of management can be found. Those who fail are quickly lost from sight and memory; but their number is very great. It is said that in America three-fourths of those who engage in trade become insolvent in the course of the first five years (Bowen, *American Political Economy*, chap. x.).

"§ 8. The supply of skilled labor is increasing faster than that of unskilled labor, and the supply of business power is increasing faster than that of the lower kinds of skilled labor. Thus the competition of business power for the aid of the lower orders of labor in production is increasing. And, as a consequence, the earnings of management that can be got by doing work of a given order of difficulty—the *task-earnings* of management—are diminishing. The continual increase in the complexity of business, and the continual increase in the amount of capital that can be employed in business under a single management, are indeed giving to business ability of the highest order the opportunities of obtaining greater earnings of management than were ever heard of in earlier generations. But the total amount of the earnings of management is not so high in proportion to the amount of capital employed as it used to be. And

the ratio which the earnings of management of a business bear on the average to the capital employed goes on diminishing; and will probably continue to diminish. For the growth of education will increase rapidly the supply of business power that is competing for the aid of hired labor in production; and this competition will prevent the earnings of management from growing as fast as capital is likely to grow.

"Since the normal rate of interest is likely to fall, and the ratio which normal earnings of management bear to capital is likely to fall, and since profits are composed of interest and earnings of management, therefore the normal rate of profits is likely to fall. It will not fall rapidly for a time, and then remain stationary at a *minimum*. But subject to some oscillations its fall will probably be continuous, tho increasingly slow, so long as the world is inhabited by men of the same nature with ourselves."

So argues Mr. Edward Atkinson. He says (*The Industrial Progress of the Nation*, p. 305):

"Under existing institutions and laws the working classes, in the sense in which they use that word, have been securing to their own use and enjoyment an increasing share of an increasing product. ad. The richer classes controlling and using capital are securing to their use, control, and enjoyment a decreasing share of the same increasing product."

For Mr. Atkinson's proof of this, as also for contrary views, see articles WEALTH and WAGES.

PROFITS (NET). For a discussion of the principles involved, see PROFIT. We are concerned here simply with the facts. Statistics as to net profits, and conclusions deduced from them, must be suspiciously viewed. The *Twenty-first Annual Report of the Massachusetts Bureau of Statistics of Labor* reports on the net profits of 64 manufacturing industries in that State, but even this report has been most severely criticized. We give its conclusions, and some of the criticisms upon it. Says the report (pp. 623-630):

"We first bring forward the following general caution:

"No one should make use of these tables without careful consideration of the analyses for each industry which follow the tables. These analyses are intended to supplement the tabular presentations, as deductions drawn from the figures alone, without due regard to the analyses would, in many cases, be misleading.

"ESTABLISHMENTS AND CAPITAL INVESTED.

"In the returns as to net profits 10,013 establishments are represented, representing 75.45 per cent. of the grand aggregate of capital invested in all establishments in all industries, and in them was produced nearly 70 per cent. of the entire product turned out in the manufacturing and mechanical industries in the commonwealth. Of the 10,013 establishments, 9251, or 92.39 per cent., made a profit, while 762, or 7.61 per cent., did not make a profit. The establishments making a profit had 81.22 per cent. of the capital invested, and made 88.77 per cent. of the goods manufactured. The establishments not making a profit had 18.78 per cent. of the capital invested, and made 11.23 per cent. of the goods manufactured. The result for all industries was a net profit amounting to 3.90 per cent. of the selling price, and equivalent to 4.83 per cent. on the capital invested.

Capital Invested.

"CLASSIFIED CAPITAL.

"Out of the grand total of \$500,504,377 of capital invested in manufacturing and mechanical industries in the commonwealth, land, buildings, and fixtures are valued at \$118,885,643, or 23.74 per cent. of the total; machinery, implements, and tools at \$115,254,330, or 23.03 per cent.; cash at \$173,440,047, or 34.65 per cent.; and credit at \$92,012,457, or 18.58 per cent. For every \$100 invested the proportions of the details are as fol-

lows: Land, buildings, and fixtures, \$24; machinery, implements, and tools, \$23; cash, \$35; credit capital, \$18. The total plant values represent \$47, and the total cash and credit capital, \$53.

"COST OF PRODUCTION.

"As to cost of production, each \$100 of total cost includes the following elements: Stock (including raw or manufactured materials), \$67.67; salaries, \$1.08; wages, \$25.66; rent, 85 cents; taxes, 64 cents; insurance, 38 cents; freight, \$1.46; new equipments, 28 cents; repairs, 93 cents; other expenses, 15 cents; these items aggregating \$100, or 100 per cent., if the items are considered as percentages instead of dollars and cents. By total cost is meant the cost to the manufacturer of the completed product, ready for sale, but excluding profit.

"RELATION OF COST OF PRODUCTION TO SELLING PRICE.

"As to selling price, each \$100 of selling price includes the following elements: Stock, or materials, \$58.01; salaries, \$1.73; wages \$22.34; rent, 73 cents; taxes, 56 cents; insurance, 33 cents; freight, \$1.27; new equipment, 24 cents; repairs, 81 cents; expenses not previously enumerated, 13 cents. In each \$100 there is an excess of selling price above the cost of production amounting to \$12.95. This \$12.95 is the manufacturer's gross profit, and is equivalent to 16.01 per cent. on the amount of capital invested in, and needed to carry on his business. These items, as enumerated, including gross profit, aggregate \$100, or 100 per cent. if the items are considered as percentages of selling price instead of dollars and cents. By selling price is meant the price for which a given quantity of manufactured product is sold by the manufacturer, and it includes, as shown above, cost of production, and profit, if any.

"DISTRIBUTION OF EXCESS OF SELLING PRICE ABOVE COST OF PRODUCTION.

"Of the 64 industries considered in the investigation all but one, print works, dye works, and bleacheries, show an excess of selling price above the cost of production; that is, all but one made a gross profit. The net profit was determined by the following deductions, determined upon after careful consideration:

Interest on cash and credit capital.....	5 per cent.
Depreciation in the value of machinery, implements, and tools.....	10 per cent.
Allowance for selling expenses, losses, and bad debts.....	5 per cent.

"After these deductions were made, 58 out of 64 industries exhibited a net profit.

"The excess of selling price above the cost of production amounts, on an average, to \$12.95 in each \$100 worth of manufactured product. If from this \$12.95 excess are deducted the following: \$2.15 for interest, \$1.00 for depreciation on machinery, implements, and tools, and \$5.00 for selling expenses, and to make up for losses from bad debts, there will then remain as net profit \$3.90, which is equivalent to 4.83 per cent. on the amount of capital invested, or an annual return of \$4.83 upon each \$100 of invested capital.

"COMPARISON OF EARNINGS AND PROFITS.

"In private firms, each of 257,656 employes (including both sexes and all ages) receives an average of \$362.23 for annual earnings in return for his labor, while each of 12,553 partners in private firms, with an average investment of \$10,707, receives an average net profit of \$517 in return for his money investment and his labor.

"In corporations, each of 162,310 employes (including both sexes and all ages) receives an average of \$333.22 for annual earnings in return for his labor, while each of 30,967 stockholders in corporations, with an average investment of \$7857, receives an average net profit of \$379 in return for his money investment, mainly, as comparatively few stockholders render any personal service, unless paid salaries therefor, to the corporations in which they are financially interested.

"As a general result in all industries it appears that: First, in private firms, the percentage of the average yearly earnings of each employe of the average net profit to each partner is 70.02, or a little more than seven-tenths; second, in corporations, the per-

centage of the average yearly earnings of each employe of the average net profit to each stockholder is 87.86, or a little more than seven-eighths. These figures show the narrow money margin between the earnings of employes and the net profits of partners and stockholders.

"NET PROFITS TO LABOR.

"If net profits are added to the wages fund, and the sum is divided equally among the employes, the employes of private firms would receive, on the average, an increase of \$37.47, or 10.34 per cent. on their present average annual earnings; the employes of corporations would receive an advance of \$89.44, or 26.84 per cent., while the employes of all establishments, including both private firms and corporations, would receive an advance of \$57.55, or 16.40 per cent., on the average, above their present average annual earnings.

"GROSS PROFITS TO LABOR.

"Eliminating 71,025 partners and stockholders, and assuming that all the gross profits and the wages fund go to the employes, then each employe, regardless of sex or age, would receive \$541.85 for an annual income, or \$10.42 per week on the average. Of the employes now employed in manufacturing industries in Massachusetts 38.70 per cent. receive more than \$10 per week under the present application of the wage system.

"If gross profits are added to the wages fund, and the sum is divided equally among the employes, the employes of private firms would receive, on an average, an increase of \$124.24, or 34.30 per cent., on their present average annual earnings; the employes of corporations would receive an advance of \$296.55, or 80 per cent., while the employes of all establishments, including private firms and corporations, would receive an advance of \$190.81, or 54.7 per cent., on the average, above their present average annual earnings.

"SHARE AND SHARE ALIKE.'

"In the case of private firms, if net profits and wages are added together, and divided equally between the employes and partners, the employer thus sharing alike with each of his employes, the amount falling to each would be \$366.15; in the case of corporations, each employe and stockholder would receive \$334.57, while, as a grand aggregate for all establishments (including private firms and corporations), the wages fund and net profits combined would give \$349.47 to each employe, partner, or stockholder.

"THE GRAND BALANCE SHEET.

"On the share and share alike plan (or an equal division among employes, partners, and stockholders of the net profits and wages fund combined), the average annual earnings per employe would have been \$349.47 instead of \$351.02, or a decrease of 0.44 per cent.; the net profits per partner would have been \$349.47 instead of \$341.20, or an increase of 2.42 per cent.; and the net profits per stockholder would have been \$349.47 instead of \$339.71, or an increase of 2.87 per cent.

"Assuming that giving the entire net profits or the entire gross profits to labor would be more than just to labor, and consequently unfair to capital, and also assuming that the share and share alike plan is just and fair to both labor and capital, these results prove that the average financial condition of the employe shown under the wage system is slightly better, as a general average, than it would have been if the net profits had been added to the wages fund, and the sum equally divided between the employes and their employers.

"The average annual financial returns to the employe from the wage system, and from a plan in which the net profits and the wages fund, if combined, were divided equally between employes and their employers, are substantially the same, the variation being but \$1.55 per year, that sum being the excess paid by the wage system over and above what would have been derived from the share and share alike plan."

The report says further, pp. 629-630:

"The results of the investigation seem to warrant the inference that material improvement in the working man's condition is not to be expected from an increase of his money wages gained by adding thereto a portion of the net profits now absorbed by capital, but rather from an increase in his real wages, gained

Balance.

through materially increased production, accompanied by materially reduced prices, with consequent increased consumption; the rise in the standard of living implied by the increased consumption being accompanied and still further raised by reduced hours of labor.

"In the light of the results, too, it would seem that theories of industrial reform which relate chiefly to changes in the mode of distribution of the existing results of production should give place in importance to plans involving an increase in production itself, whereby both labor and capital may have more, without diminishing the amount which either now receives.

"So far as cooperation, profit-sharing, or any other scheme of industrial reform involves an increase of production, so far it moves in the right direction. But the success of any such scheme would seem to rest largely upon its power to augment production in the aggregate, by stimulating endeavor, diminishing waste, promoting harmony, simplifying management, or otherwise, rather than in the changes it might introduce in the mode of division of the fruits of production.

Conclusions.

"The general results of the investigation indicate average conditions—but no one sees such conditions. We see the exceptionally prosperous establishment, or the very rich manufacturer, and are apt to consider that all manufacturing is equally prosperous, and all manufacturers equally rich. The bankruptcy court shows the other side of the picture, but its records do not appeal to the eye or the imagination as does a large factory or an imposing mansion.

"The results, on the percentage basis, for net profits show that in few industries, if any, can the profits be called exorbitant, all things considered, for we find the largest percentages of net profit in the small industries, while large industries involve small profits, and, sometimes, large losses. As to the general result for all industries, no one, we think, will maintain that the percentage of net profit is excessive. While it is true that this conclusion is based upon an average, and may not show the condition in any one industry, it must be remembered that any of the proposed changes so frequently urged for the improvement of our industrial system must be measured by its effect upon average conditions, and that such changes may be fairly tested by comparing the new averages resulting from them with those based upon conditions now prevailing.

"Where are we, then, to look for the margin between cost of production and the price to the consumer? If neither the working man nor his employer is profiting unduly by the present system, may it not be possible that the middleman, or the distributor of wealth in its various forms, may be securing more than his rightful share, and is thus bearing down upon the two extremes between which he is placed? Are not the creators and the consumers of wealth suffering in common from the exactions of the distributors of wealth? This question cannot be answered from data now at hand, but it is evident that the mechanism of distribution, as well as the mechanism of production, must be brought to the statistical basis before the final solution of the question of profits will be secured."

This report, however, seems open to the severest criticism. Says the *Christian Union* for October 3, 1891:

"The Massachusetts returns were utterly untrustworthy. One large industry reported a net loss amounting to 28 per cent. of the value of the goods sold. Yet the returns of the manufacturers are much less misleading than the deductions of the commissioner who has edited them. The manufacturers in estimating their profits naturally deducted whatever they paid as rent, and this amounted to 4 per cent. upon the capital invested in lands and buildings. The commissioner obligingly supplements this deduction by a further one of 5 per cent. for 'interest' upon the cash and credit capital invested. The manufacturers in estimating their profits have naturally deducted 3 per cent. upon the value of the goods sold for 'salaries and freight.' The commissioner obligingly makes the further deduction of 5 per cent. for 'selling expenses and loss through bad debts.' The manufacturers in estimating their profits had naturally deducted for 'new equipments and repairs' an amount equal to 6 per cent. upon the capital invested in machinery and tools. The commissioner obligingly

makes a further deduction for 'depreciation' of an amount equal to 10 per cent. upon the capital invested in machinery and tools. By this means the profits are whittled down from 16 per cent., as reported by the manufacturers, to 4½ per cent. as returned by the commissioner. That this report should have been published by the Bureau of the Statistics of Labor shows the direction which has been given to the work of this department. The figures leave no one wiser than before and could have been published only from a desire to help manufacturers by representing that, after all, their business is in a bad way, and that higher wages, shorter hours, and lower tariff are not to be thought of. The department might better be called the 'Bureau of the Statistics of Capital.'"

Mr. Frederick B. Hawley (*American Statistical Association Publications*, 1893, vol. iii. p. 38) also severely criticizes the Massachusetts report. He finds many suspicious points in the report, all pointing one way. The great cotton-goods industry, for example, is reported as selling at a net loss of 10.91 per cent. of the selling price. Says Mr. Hawley:

"The cotton-goods industry, like others, has its ups and downs, but I do not believe it ever had as bad a year as this. But if the figures are correct, then it follows that the choice of that year for gathering of the original data was an unfortunate one."

Yet it employed 27.33 per cent. of the capital and 11.55 per cent. of the whole output of the 10,013 establishments reported, and vitiates the final conclusion, Mr. Hawley calculates, by no less than 64.61. But this is not all. Says Mr. Hawley:

"All suspicions which naturally arise as to the accuracy of the original data, or as to their being representative of normal conditions, make in one direction. So far as they should be justified by a reexamination of the facts, the correction of the data would in every case go to swell 'net profits' and the 'excess of selling price above cost of production.'"

On the other hand a business man writes to the Statistical Association that, adding together the total dividends of all the larger manufacturing and other companies in Massachusetts which have not changed their capital from 1882 to 1892, he gets \$24,420,913, and he also says that January 1, 1892, their stocks could be bought for \$11,005,913 less than January 1, 1882, and that, deducting this from the dividends, we have \$13,415,446 as the net dividends, which would make only 2.68 per cent. a year.

Such contradictory statements as these show the difficulty, if not the impossibility, of making any correct general statements as to net profits. It depends very largely upon what is included under profits. (For a discussion of this, see PROFIT.) This is true of all industries. It is particularly true of mercantile establishments. Some great stores are said, on good authority, to make 25 per cent. profit on their capital; many make little or none, and vast numbers go into bankruptcy. Of the railroads it is almost as difficult to speak, because of the differences of book-keeping. Many railroads to-day are in the hands of receivers and declare small and often no dividends. The inference would seem to be that they are making low net profits or none at all. They often state this in their annual report to their stockholders. This, however, by no means necessarily follows. It is true, undoubtedly, of some roads, but of

many roads it is simply a matter of bookkeeping. Watered stock accounts for a part of it. Railroads with watered stock try to paid dividends on capital never paid in. (See STOCK WATERING.) Duplication in accounts explains much. Railroads absorb small roads, and in their accounts the capitalization and bonds of the smaller roads appear both separately and added to the capital of the main road. Salaries and jobs granted to the officers of the road account for much. Sums put down as expenses of maintenance really often mean immense profits for some favored few. Hence, roads nominally making nothing often immensely enrich some of their owners. Undoubtedly, however, facts prove that the *legitimate* net profits of many forms of investment are not large. Most of the large fortunes made in industrial investments are made in illegitimate gambling in stocks, bulling and bearing of railroads, or in monopolies, natural or the creatures of the law. (For a discussion of this, see WEALTH.)

Mr. F. C. Waite, special agent of the Eleventh Census, in charge of *True Wealth*, makes the following statement (in Professor John R. Commons' *The Distribution of Wealth*, p. 258) as to the gross and net earnings of important natural monopolies for the census year 1890 :

	GROSS EARNINGS.	NET EARNINGS.
Railroads :		
From operation.....	\$1,051,877,632	\$331,373,057
Other sources.....	126,767,064	
Unreported roads (about).....	50,000,000	
Express companies.....	53,000,000	11,000,000
Street railways.....	90,000,000	28,000,000
Water transportation.....	191,000,000	31,000,000
Telegraph companies....	25,000,000	7,000,000
Telephone companies....	16,404,583	5,260,712
Insurance companies :		
Life.....	90,000,000	59,000,000
Fire, etc.....	54,991,613	19,000,000
Banks :		
National.....	144,614,053	72,055,564
All others (estimated)..	200,000,000	
Artificial gas companies (estimated).....	25,000,000	

* Gross receipts less gross disbursements.

It follows from this view that, if social reformers would increase wages, and lower profits, thus equalizing distribution, what they must strive for is not so much the increase of wages in legitimate industry, as for a change in laws and customs allowing of the immense profits made to-day by speculation in natural or artificial monopolies. Most reformers believe, to-day, that a more equitable distribution must come from change of system rather than from mere generosity on the part of employers. That in some way immense net profits are made to-day, the facts of the distribution of wealth, both in England and America, abundantly prove (see WEALTH).

Mr. T. Lloyd, in the *London Statist* for June 27, 1895, asks whether "capital is about to depreciate so much that practically the business of banking threat-

ens to become unprofitable, and that it will require hundreds of thousands of pounds for a private family to live out of its investments in even moderate comfort." He says no. His argument is that it is true that to-day there is a plethora of money, and that, therefore, money commands small returns, but that this is due to special causes which stare us in the face. They are "the Baring crisis; the breakdown of the South American States, and subsequently, of Portugal and Greece; the difficulties of Italy and Spain; the banking collapse in Australasia; the currency crisis in the United States, and the currency troubles in India." All this has immensely reduced the call for investments. "From 1882 to 1890," he says, "investments in the Central and South American States alone had taken from Europe, and chiefly from London, £30,000,000 annually." (See PROFIT.)

Of the United States, he says: "European investments, and chiefly British investments, in the United States were at least as large as those in all the Central and South American countries taken together." About £15,000 annually, he estimates, were invested in the Australian colonies. All these investments have been very largely cut off. But he says this is only temporary. All these countries, he says, are growing, and will soon need capital. Of the United States, "for so long a time the greatest field of all for our investments," he says: "Whenever the currency there is restored to order, there is certain to be a great outburst of activity, and an immense investment of British capital. . . . It matters very little what policy is ultimately adopted. There may be a short period of crisis and panic, but once a definite policy is adopted and carried out, trade will revive, and enterprise will spring up again. . . . As they go, they will absorb more capital, and so tend to raise values in the money market."

PROFIT-SHARING.—This system of industrial remuneration has been defined as "the division of realized profits between the capitalist, the employer, and the employee, in addition to regular interest, salary, and wages"; and it is claimed by its advocates to be "the most equitable and generally satisfactory method of remunerating the three industrial agents."*

It has also been defined by the International Congress, held in connection with the Paris Exposition in the summer of 1889, as "a voluntary agreement under which the employee receives a share, fixed beforehand, in the profits of the business."

Participation of the workmen in the profits of business undertakings is, historically, a method first prominently associated with the name of the Parisian house-painter and decorator, Edme-Jean Leclair. The son of a poor shoemaker, he was born May 14, 1801, in a village about 100 miles southeast of Paris. As a youth he became an apprentice to a house-painter in Paris, and showed himself remarkably diligent in his work, and in supplying the defects in his education. He set up for himself in 1827, and his first great stroke of business was a contract for painting seven houses in 1829, by which he cleared 6000 frs.; he paid his men 5 frs. per day on this job, instead of the usual 4. His business increased steadily, and his men, noted for their skill and temperance, were kept steadily at work in winter, and were tided over times of low wages by Leclair's interest in their welfare. In 1838 he established a mutual aid society for them, which he found "a powerful means of moralization." But he desired, furthermore, to provide for his men in their old age, and in case of a change in the ownership

* *Profit-Sharing Between Employer and Employee*, by N. P. Gilman, p. 412.

of the business. A friend, M. Frégier, told him that he saw no solution to the problem except in the participation of the workmen in the profits of the master. "This was in 1835," writes Leclaire. "My head was too thoroughly crammed with all the ideas of the economists and reformers of the time to relish this proposition. It appeared to me entirely impracticable. I rejected it emphatically." But all at once, five years later, he perceived that he might have made a great mistake in his reasoning. He could not afford to take out from his average profits a sum sufficient to help his workmen much. But would not an industrial partnership "*create*, by the common effort, in view of the division of profit, and with the energy so called forth," a further return beyond the average, which would not only pay the workman a bonus, but might even increase the profits of the employer? Are there not, in the common workman, moral qualities to which the simple wages system makes slight appeal, because it leaves the inspiring word "profit" out of the workman's vocabulary, with all its implications of ambition, zeal, and persistence? Would not the prospect of a share in the profits of business advance the prosperity of the establishment by increasing the quantity of the product, by improving its quality, by promoting care of implements and machinery, and economy of materials, and by diminishing labor difficulties and the cost of superintendence? Leclaire tried the experiment cautiously, beginning in 1842, after due preparation; and he soon found that all these questions were answered by experience with a decided affirmative.

His workmen, despite his many efforts for their good and his careful preparations for the new scheme, were suspicious at first, but the first bonus changed their feelings. On the 12th of February, 1843, Leclaire distributed to 44 workmen 12,266 francs. When he was a candidate for the Constituent Assembly, in 1848, he stated in his electoral address that he had distributed in six years 112,588 francs. The number of participants had risen to 98. "This is what we can do without touching any one's property; this is what I have practised for six years; I have found my profit in it, and others also."

In 1853 Leclaire associated with himself M. Alfred Defournaux, the son of an overseer, who had grown up in the house, and the Mutual Aid Society was reconstituted for a second term of 15 years, its entire resources to consist of annual donations from the house. In 1860 the time limit was abolished, and retiring pensions established. In 1863 the Mutual Aid Society was incorporated and became a perpetual sleeping partner with limited liability in Leclaire et Cie. Of its accumulated capital, 116,442 francs, 100,000 francs were invested in the firm at 5 per cent. interest. It received 20 per cent. of the net profits, while 30 per cent. went to the workmen as a bonus calculated on wages. This was the result of 21 years' trial of profit-sharing. In 1865 Leclaire withdrew from active business; in 1869 the system was thoroughly revised, and in 1871 a resolution was passed admitting to a share

in the profits the apprentices and auxiliary workmen. Henceforth, even a single day's work entitled a transient employee to a share in the bonus. Leclaire died at Herblay, near Paris, in 1872, leaving a fortune of 1,200,000 francs, which he attributed largely to his system of participation.

The Maison Leclaire is now an elaborate and almost ideal industrial partnership. It has two managing partners and one sleeping partner, the Mutual Aid Society. The society holds half of the capital of 400,000 francs, and each partner a fourth. If, when a new partner is chosen by the men, he has not this amount of capital, the acquisition of it is rendered easy for him. The reserve fund is 100,000 francs. When it falls below this amount a first levy of 10 per cent. is to be made upon the profits of the year until it is restored to its normal size. Capital receives 5 per cent. interest, and each manager 1200 francs as salary for superintendence. After interest, salary for management, and any needed sum for the reserve fund have been taken from the gross profits of the year, the net profit is thus divided: One-quarter part goes to the two partners, a second to the society, and the remaining half to the working force in proportion to wages and the number of hours' work done. Between 1870 and 1886 the number of participants varied from 710 to 1125, the total of wages paid from 406,414 francs to 1,069,905, the total bonus from 61,625 francs to 240,050, and the ratio of bonus to wages from 12 to 24 per cent. The liability of the workmen is confined to their interest in the reserve fund, which has never yet been drawn upon to pay losses.

The *noyau*, or nucleus, is an important feature in the Maison Leclaire. The conditions of membership are five years' service in the house; age between 25 and 40; ability to read, write, and cipher; skill in work, and good moral character. The membership is kept at nearly the same figure; the members have a first claim to employment in bad times; it supplies men for vacancies in the clerical force, from which it elects a new partner on occasion. It chooses eight members of the committee of conciliation, the partners being the other two. This committee takes cognizance of any misconduct in the force, and examines candidates for admission. The *noyau* chooses the foremen each year from a list submitted by the managers. Membership in the *noyau* is a condition for admission to the Mutual Aid Society, which is thoroughly organized and generously administered, giving aid in sickness, at death, and in pensions and life insurance policies. In 1887 its property was 2,053,618 francs.

The workman in the Maison Leclaire receives the highest wages paid in his craft in Paris; a year's bonus varying from 12 to 24 per cent.; in case of sickness five francs a day; in case of permanent disability, a pension of 1200 francs, and he may retire on such a pension after 20 years' service. His sons are preferred as apprentices, and at his death 1000 francs of life insurance are paid to his

The Maison
Leclaire.

family and the funeral expenses defrayed. The standard of skill and character corresponds to these exceptional advantages. Peace and good-will reign in the establishment, and its long career of more than 50 years of prosperity has made it the classic instance of profit-sharing elaborately developed.

The profit-sharing firms of France are now some 125 in number. Among the more important cases, for size and length of trial of the system, are the noted Bon Marché of Paris, employing 3000 persons, and doing a business of thirty millions of dollars a year; the immense Chaix printing house of Paris; the great Godin foundries at Guise, with a capital of 6,000,000 francs, and the Laroche-Joubert paper works at Angoulême, with its thousand employees.

In England profit-sharing had a celebrated trial in the Briggs' collieries between 1865 and 1874; the experiment was highly successful for six years, but great fluctuations in the coal trade and difficulties with trade-unions caused its abandonment. (See the

England.

detailed accounts of this important case in the works of Sedley Taylor and N. P. Gilman on the general subject.) This result delayed any considerable extension of the system in England for some 15 years; but as the causes of the Briggs' failure became better known and information concerning the system more accessible, instances have multiplied. According to the list given by Mr. T. W. Bushill in *Profit-Sharing and the Labor Question*, there were in Great Britain, on the 1st of January, 1893, four industrial partnerships proper, with 700 employees, and 71 profit-sharing firms with some 19,000 employees. The number has since increased. Numerous cooperative productive societies also pay a bonus on wages, and many firms make a regular practise of it, without binding themselves to do so, at the beginning of the year. In the United States there were 37 cases of profit-sharing in 1889. Making allowance for the instance of discontinuance of the system, it is a conservative estimate that there are now half a hundred firms practising profit-sharing in America. No list of such firms has been published since 1889, including a number of instances in Germany, Switzerland, Holland, and Italy, there are now, beyond doubt, 300 firms applying this principle of a division of profits with their employees.

The Peace Dale (R. I.) Manufacturing Company was the first to establish participation in profits in this country, in 1878. It still maintains its regulations on this subject, but the woolen manufacture has not been sufficiently prosperous there to allow the payment of a bonus; this will be paid, however, in any year in which the balance sheet will allow. The great Pillsbury flour mills at Minneapolis have been purchased by an English syndicate, but the Honorable Charles A. Pillsbury and his associates in the operation of the mills continue the plan of profit-sharing, with which they express their entire satisfaction.

The system which Mr. Alfred Dolge, the large manufacturer of piano felt and felt

shoes at Dolgeville, N. Y., has satisfactorily developed, includes provisions for pensions and life insurance, in addition to a division of profits, among the foremen chiefly. A clubhouse, a library, and a gymnasium are maintained (see DOLGEVILLE).

United States.

The manufacturing company the head of which is Mr. N. O. Nelson of St. Louis is, in several ways, the most conspicuous of all American profit-sharing enterprises.

The N. O. Nelson Manufacturing Company is transferring its works gradually to a suburb of Edwardsville, Ill., situated within an hour's ride of St. Louis. In this village, Leclair (*q. v.*), the building of a home is rendered easy by the Cooperative Building Association and special facilities provided by the company; a large club-house is managed by a considerable number of men, who lodge and board in it at a moderate price; all the buildings are provided with water, steam-heat, electric light, good drainage, and nearly every other convenience of a city house; provision for amusements has not been overlooked.

The first year's dividend, paid by the company in 1887, was 5 per cent. on wages; the next, 10 per cent.; the third, 10 per cent.; the fourth, 8 per cent.; the fifth, 10 per cent.; the sixth, 7 per cent., and the seventh 4 per cent.; making 54 per cent. in seven years, or, practically, 8 per cent. a year. In 1893 the company succeeded in paying its full force full wages for full time (a nine-hour day), but earned no bonus. The dividends for the first five years were paid in cash, but employees were always at liberty to take it in stock, and about three-fourths did so. After having paid the dividends in cash for five years, the company took up the plan of paying only in stock; it has always been a rule to redeem the stock at par, when the holder leaves the company's employ.

Other cases of profit-sharing in the United States deserving attention are the Page Belting Company of Concord, N. H., the Yale & Towne Lock Company of Stamford, the Proctor & Gamble soap works of Cincinnati, the *Century Magazine* Company, the Riverside Press at Cambridge, Mass., and the De Vinne Press, New York.

The employees of the Bourne mill at Fall River have received their thirteenth semi-annual dividend in the profit-sharing plan that has been in use at the mill during the past 6½ years. One family received \$70 as its share of the profits for six months, and other families received from \$30 to \$50 each. Individual employees received from \$3 to \$10 each. The treasurer expresses himself as fully satisfied with the results, and he believes he has accomplished all he anticipated when he put the plan in operation.

The French Society for the Practical Study of Profit-sharing, founded in 1870, is a flourishing organization, of which M. Charles Robert (since 1865 the president of the Mutual Aid Society of the Maison Leclair, and director of the Union Insurance Company) has been the only president. Membership in the society is confined to business

Societies.

men practising the system; an octavo quarterly *Bulletin* is published. In England an Industrial Reform Society, which includes profit-sharing in its program, has lately been established; the Labor Association advocates the plan, and the Cooperative Union has gradually come to indorse it. An Association for the Promotion of Profit-sharing was formed in New York in January, 1892. Its object is "the promotion and extension of such methods of uniting the interests of employers and employees as 'profit-sharing,' 'industrial partnership,' 'gain-sharing,' 'earnings-sharing,' 'the premium system,' and kindred systems."

This association has published for four years a quarterly periodical, *Employer and Employed*, edited by the secretary (Boston: George H. Ellis, 141 Franklin Street; 40 cents per annum); here may be found the news of the movement, and the latest arguments in favor of it. The officers of the association are: President, Carroll D. Wright, United States Commissioner of Labor, Washington, D. C.; vice-presidents, President F. A. Walker of the Massachusetts Institute of Technology, Boston, Mass., and N. O. Nelson, of St. Louis, Mo.; secretary and treasurer, N. P. Gilman, Chestnut Hill, Meadville, Pa.; executive committee, Messrs. R. Fulton Cutting and Alfred Dolge of New York, Henry R. Towne of Stamford, Conn., and George A. Chace of Fall River, Mass., and Professor F. H. Giddings of Bryn Mawr, Pa. The annual fee for membership is three dollars.

It is not on the ground of abstract justice or inherent right,—these are matters about which it is very easy to be mistaken,—but on the ground of ordinary human nature and actual experiment, that the advocate of profit-sharing bases his confidence on its gradual diffusion.

He can now appeal to a large body of experience in favor of his claim that a regular dividend to labor out of profits is one of the next steps which the evolution of industry is likely to follow in numerous quarters.

This position has been well stated by the United States Commissioner of Labor in his report for 1886.

"What is known as industrial copartnership, involving profit-sharing, and embodying all the vitality there is in the principle of cooperation, offers a practical way of producing goods on a basis at once just to capital and to labor, and one which brings out the best moral elements of the capitalist and the workman. This system has been tried in many instances, and nearly always with success. . . . Wherever the principle has been tried there have been three grand results: Labor has received a more liberal share for its skill, capital has been better remunerated, and the moral tone of the whole community involved raised. Employment has been steadier and more sure. The interest of all has been given for the general welfare. Each man feels himself more a man. The employer looks upon his employees in the true light, as associates. Conflict ceases, and harmony takes the place of disturbances."

As Commissioner Wright had previously declared:

"The dividend to labor is not usually an increase of pay, services remaining the same, but a form of extra pay for extra services, and an inducement calling them out. The extra services called out, and the manner in which they are called out, constitute an invaluable educational discipline. They develop the

whole group of industrial virtues: diligence, fidelity, care-taking, economy, continuity of effort, willingness to learn, and the spirit of cooperation."

The usual judgment of employees who have had a thorough trial of profit-sharing is given in these resolutions passed by the force of the Nelson Manufacturing Company in December, 1892:

"Whereas, The corporation of which we are a part has been practising profit-sharing longer than any other large concern in the United States; and,

"Whereas, There are daily evidences in the press that the system under which we operate is attracting the serious attention of business men, who, a few years ago, gave it only a passing thought as a thing Utopian, be it

"Resolved, That we record our increased confidence in, and appreciation of the business principles and business practise of cooperation

"Resolved, That, since seven years of experience under the system have resulted not only in the prosperity and exceptional growth of our company, but in an actual distribution of the benefits among the men at the bench, as well as among the capitalists, we commend the plan as a harmonizer of the interests and views of both classes, and as a powerful agent for the solution of the old and stubborn problem presented by the antagonism between capitalists and laborers.

"Resolved, That, since it has brought us to shorter working days, for the standard day, with the added benefit of an interest in the company's profits, and an opportunity not elsewhere enjoyed for investing our savings where there is a direct relation between the profits on our investment and the quantity and quality of the work we do, we observe with pleasure the disposition of railroad men, and other large handlers of capital, to adopt the method that has so much of humanity, and so much of common sense to commend it."

Conceived by a business man of uncommon sagacity, profit-sharing has received practically the unanimous indorsement of the political economists, from John Stuart Mill down to Professor Marshall of Cambridge, Eng- **Argument.** land. The economists heartily advise a wide and thorough trial of the plan, that its practical utility and its limitations may be determined by actual experience. The principle is very flexible, and admits of a great variety of forms and applications.

The objection invariably made to profit-sharing by the employer of labor who disregards the fact of its limitations, and its difference from cooperative production, is that it makes no provision for the sharing of losses by the employee. These limitations and this difference, however, make the scheme what it is, and the payment of losses out of wages received by the workmen would necessitate in equity other features which would revolutionize the scheme. This, the most common of all objections to the profit-sharing plan, appears superficial, and quite wide of the mark, when we consider that the partnership, into which the employer himself invites the men, is industrial, not commercial; that he surrenders in no manner or degree his absolute control over affairs; that he is just as much of an autocrat as he was before; that he keeps his books entirely free from troublesome inspection; that he fixes himself the percentage of the bonus on wages, after he has calculated the average profit of a series of years, good, bad, and indifferent; that he is to pay this bonus in prosperous times only, when it has actually been realized; and that he is not to

pay it in any year until a proper contribution has been made to a substantial reserve fund. When we attend to all these points, there appears a plain element of absurdity in the objection to industrial partnership, that it does not require the workman to contribute toward losses out of his savings or his wages. His responsibility must in reason and equity be measured by the power allowed him. If we give the body of workmen, in a shoe-factory or a flour-mill where they think of practising profit-sharing, the right to examine the books at any time; a powerful voice in shaping the business policy; the right to say when to buy and where to sell—then we can reasonably and equitably ask them in a bad year to bear a share of the money loss, out of the wages and the bonuses received. But, however such an arrangement might work, it is not the actual or historical system of profit-sharing or industrial partnership: it is an entirely different system.

Profit-sharing is a conservative movement. It attempts to recall, as far as is possible under the changed conditions of modern industry, the old sentiment of partnership felt when the shoe manufacturer in his small shop worked at the same bench with his few employees, or when

the farm was let on shares, or the catch of the fishing schooner was apportioned among the crew. We can no longer divide the actual products of industry among the workers. But we can modify the wage system, and strengthen it at a weak point, by adding to fixed wages a variable bonus, dependent on the workman's zeal. Industrial partnership, again, has this singular advantage over the socialisms of the day, and even over the more sober scheme of productive cooperation: it pays due respect to the two great principles of modern society which must find a *modus vivendi*—Democracy and Aristocracy. Those who would solve all industrial troubles by a resort to the easy but deceptive analogy of democratic government, and the erection of an "industrial republic," declare that profit-sharing is not a practical reform, that it is unjust to the workman, since the bonus is bestowed as a gift and not as a right, and that, in reality, it intensifies the evils of the wage system by making the working man more dependent on the employer. These objections by socialists and revolutionary reformers have the character usual in criticism of moderate and statesmanlike measures by theorists. The practicability of the system has been amply proved by many firms in long years of trial. The bonus tends steadily to become a fixed and regular addition to wages, dependent not on the mere will of the employer, but on a written agreement and the results of the year. In its developed and logical form, profit-sharing makes the transition to cooperative production more gradual, easy, and sure than any other method yet devised. Its advocates do not find any objection to it in the fact that the employer often profits by the system as well as the employee, but this fact seems sufficient to

stamp the plan as iniquitous in the eyes of so-called reformers who consider that the employer should either lose or, at least, not profit by any change in existing methods. A system advantageous to both parties fails to commend itself to such very partial thinkers! Profit-sharing, on the contrary, starting from the actual state of things, would modify this in the interest of both parties and to the injury of neither; and here is its recommendation to the enlightened employer and the sensible workingman.

For details of the history of profit-sharing and its present condition, and a full statement of the argument for it, see *Profit-sharing between Employer and Employee*; and chap. ix. of *Socialism and the American Spirit*, by N. P. Gilman (a bibliography may be found in the first work, continued in the second); *Profit-sharing between Capital and Labor*, by Sedley Taylor; *Profit-sharing and the Labor Question*, by T. W. Bushill (an employer); *Sharing the Profits*, by Mary W. Calkins; *La Participation aux Bénéfices*, the French translation of Dr. Victor Böhmer's work, with additions; *Guide Pratique pour l'Application de la Participation aux Bénéfices*, per A. Trombert; *Methods of Industrial Remuneration*, by D. F. Schloss (critical); *History of Cooperation in the United States*; the *Bulletin of the French Society*, and *Employer and Employed (passim)*.

N. P. GILMAN.

OBJECTIONS TO PROFIT-SHARING.

1. That it is not practical, not being suited to the times. The distinguishing economic characteristic of the present time is a tendency to combination. Firms that will not enter into combines, or are not themselves doing a very large business, are troubled not as to the way in which to share their profits, but as to their inability to make any profits to share. In the best times many firms make no profits. Profit-sharing is scarcely then applicable except to great monopolies and the strongest firms. Of the seven instances in New England cited by Professor Bemis (*Cooperation in New England*, by Professor Bemis, in publications of the American Economic Association, November, 1886), one, a shoe establishment of Brockton, Mass., was not a case of profit-sharing, but a percentage on capital paid in by workmen; one, the New Haven Wire Company, merely proposed the plan to the employees, which was *rejected*; and *only one of the entire seven had ever paid a dividend*. Mr. Paul Monroe states, in the *American Journal of Sociology* for May, 1896, that of 50 cases of profit-sharing only 12 continue. Its friends claim that in many cases of discontinuance the failure was due, not to anything inherent in the system, but to extrinsic causes. This is true and is the most damaging and conclusive testimony against the system. It is not suited to the times. Extrinsic causes usually prevent its successful operation. Its diagnosis of present evils does not go deep enough. Employers can rarely practise it, and employees care little for it.

2. Even when successful, as it is in a few strong firms, it is of questionable advantage to working men. *Unless coupled with other reforms*, which are not profit-sharing, it gives the worker no voice in the management. It does not develop the responsibility of the worker. Its advocates claim, indeed, that while it does not do everything, it is at least a practical first step to-day, toward industrial partnership. This, its critics say, is not the case. In their view it is not a step toward industrial democracy or fraternity. It intensifies paternalism. It says, "if you, the worker, will work a little harder, *we*, the management, will give *you* a slight share of your increased earnings." Mr. Monroe (see above) sums up the case as to profit-sharing by declaring it of some importance from a statistical point of view, but little, if any, from that of social progress.

3. Profit-sharing is unjust.

Says a recent writer—we abridge his words :

There is only one party to it, and that is the employer. He proposes it; he decides when a surplus of profits exists, and how much it is; he lays down rules for apportionment and distribution among employees; in a word, he manages the business and the books, without any right of interference or question by employees, and from his decision there is no appeal. All these things give profit-sharing the appearance of a gift bestowed, whereas it is a payment earned. It is not legally a gift which must take effect immediately; it is a mere promise without consideration, and cannot be enforced. Wage-workers demand not merely greater wages, which they have already obtained, but a *greater proportionate share of products* in accordance with the new ethics of social justice. Profit-sharing not only offers no balm for this, the real wound of industrial society, but aggravates the difficulty. Mr. Gilman, in the work above quoted (pp. 415-416), says that employers who have adopted profit-sharing "generally agree that the division of a bonus among the working men is good business policy; . . . in most cases they claim that their own share is greater than the whole profits were under the simple wage system." By what means has their share become "greater"? Through whose efforts are they enriched by extra profits? Says Mr. Gilman: "Out of this extra profit comes the share of men *whose diligence and care have created it*." The italics are ours.

Profit-sharing thus *reduces the proportionate share* of workmen. If extra profits, or, in other words, more goods, are produced solely by the "diligence and care" of employees, to them should belong the goods. No part of them should go to capital, for this has played no part in creating the surplus: no part should go to the employer, for he has done actually less. Every consideration of justice demands that laborers, who have by increased exertion produced more, should alone have the fruit of their labor. To bestow a part of this on the laborer, and a part on the employer, is what profit-sharing graciously offers to do!

4. Profit-sharing misleads. It has been before the world fifty years. Largely tried, it has to-day only 108 firms in all the United States and Great Britain. Meanwhile the social question is developing a crisis around the world. Society demands deeper remedies than what has accomplished so little in fifty years, and that of doubtful good.

PROGRESSIVE TAXATION. See TAXATION.

PROHIBITION.—The object of Prohibitionists is to obtain laws prohibiting the manufacture and sale of intoxicating liquors, except for the purpose of manufacturing industries, science, and art. They argue that this is ad-

visible, because vast sums of money are annually wasted by the people in the purchase of liquor, and its consumption reduces the productiveness of labor; because pauperism and crime are largely increased thereby; because the habit of drinking renders the citizen less able to serve in the defense of Government, when necessary; and because the Government should protect the defenseless women and children, who are most injured by drunkenness. The opponents of prohibition dispute some of the facts of its advocates; assert that drunkenness is rather the accompaniment than the cause of pauperism and crime, and argue that in any event, prohibitory laws cannot be enforced, and that some other system will be more effectual in restraining the sale of liquor. They also contend that prohibitory laws infringe the individual liberty of the citizen. On December 5, 1887, the Supreme Court of the United States rendered an important decision, holding that it is within the discretionary police powers of a State to protect public health, safety, and morals, even by the destruction of property, and that the Kansas laws, providing for the destruction, without compensation, of property used in connection with liquor-selling, do not violate the provision in the Fourteenth Amendment to the Constitution, that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of . . . property, without due process of law." The Prohibitionists have been a factor of importance in the politics of some of the States since about the middle of the century. A prohibitory law was passed in Maine in 1846, and in 1851 a more stringent one, including the provision for the seizure and destruction of intoxicating liquors (known as the "Maine Law," and drafted by Neal Dow), was enacted, and has since been in force, except for the years 1856 and 1857. Vermont in 1852, New Hampshire in 1855, and Connecticut in 1854, passed the Maine law; the first has retained, and enforced it; the second has retained, and not enforced it; and the last never enforced it, and repealed it in 1872. New York had the Maine law on the statute books between 1855 and 1857. Ohio and Michigan, by their Constitutions, forbade the passage of a license law, thus leaving the mere alternative between free liquor and prohibition. This clause of Michigan's Constitution has been repealed; the question of replacing it was defeated in 1887, by a small popular majority. In Ohio attempts have been made to tax the sale of liquor by the "Pond Tax Law," and the "Scott Tax Law," but both of these were pronounced unconstitutional by the courts. A prohibitory amendment to the Constitution of Kansas was ratified by the people in 1890, and this has been enforced by legislation. A similar amendment was passed in Iowa in 1882, and had a large popular majority, but in the next year it was pronounced invalid because of informalities in its passage. In 1884 a prohibitory law was passed by the legisla-

History.

ture. In 1894 this was modified by a tax or "mulct" law. In North Carolina, in 1884, a prohibitory law, submitted to popular vote, was defeated (166,000 to 48,000, in round numbers). After several previous trials of prohibition, Rhode Island, in 1887, passed a stringent prohibitory law, which was repealed in 1889. In 1887, on the question of prohibitory amendments to the State Constitution, the Prohibitionists were defeated in Oregon, Tennessee, Texas, Pennsylvania, Nebraska, and Massachusetts. Most of the States have passed laws prohibiting the sale of liquors to minors, and on Sundays. Many States have adopted local option, and a few are trying high license.

Through the efforts of Colonel Eli F. Ritter of Indianapolis, Ind., the Indiana Supreme Court has recently affirmed that the owners of licensed saloons, and the owners of property in which they are kept, are liable for damages to adjoining property from the presence of the saloons. Movements are on foot to secure similar rulings in other States.

The following expositions of Prohibition are from the pens of prominent advocates of the movement.

I. WHAT PROHIBITION MEANS.

Prohibition, the opposite of permission, is not a synonym of annihilation. Those who say, "Prohibition does not prohibit"—a self-contradictory proposition—mean that prohibition does not annihilate. This is manifestly true of all kinds of prohibitions in this world—those of the divine government, of family government, and of civil government alike. Prohibition does not annihilate, not even when it forbids murder, adultery, theft, false witness, and Sunday-work. If a threefold alliance of man, woman, and the devil, to break a prohibitory law, and then hide away from justice, proves the law a "blunder," what is to be said of that first prohibition, given to man by God himself, in Eden? If prohibition is a "failure" when it does not at once destroy the evils which it forbids, then the prohibitory law of Sinai is the masterpiece of failures.

Prohibition does not define accomplishment, but only the aim and attitude of government toward wrong. License is a purchased truce—sometimes a surrender; Prohibition is a declaration of war. License is an edict of toleration—sometimes a certificate of "good moral character"; Prohibition is a proclamation of outlawry. As murder, adultery, theft, false witness, and political corruption are outlawed, the ringleader of this "gang" ought also to be outlawed. The first requisite of law is justice. A law that sanctions wrong is not law at all, but legislative crime. It is not "public sentiment," but public conscience, out of which law should be quarried. Law is an educator. Dueling, and smuggling, and liquor-selling were once in the "best society." Gradually the law has made them disreputable. Rum-selling in Maine is a sneaking fugitive, like counterfeiting—not dead, but disgraced, and so shorn of power.

Prohibition of the liquor traffic is more than a standard or a flag to mark the height to which

we are marching. No other kind of prohibition, as I have said, has had greater victories. In Maine children grow up without ever seeing a drunken man. In most parts of Kansas and Iowa the law against the saloon is as effective as the law against the brothel or the burglar. To this fact testify a glorious company of witnesses—governors, senators, congressmen, pastors, physicians, manufacturers—against whose evidence scarcely a witness can be brought in rebuttal except "anonymous." The liquor-dealers have saved us the trouble of summing up this testimony. Their statement that more liquor is consumed under Prohibition than without it is canceled by actions that speak louder than words, by frantic efforts, at great cost, to defeat Prohibition wherever it is proposed. If, while canceling their license fees, it really increased their sales, and so gave them double gains, as they are sometimes able to make even Christians believe, they would hardly fight so helpful a friend.

The argument for Prohibition may be concisely stated in four propositions, the four strands of the halter with which the rum traffic is to be hung :

1. The business interests of our country demand the suppression of their worst foe—the saloon.
2. The homes of our country demand the suppression of their worst foe—the saloon.
3. The political liberty of our country demands the suppression of its worst foe—the saloon.
4. The conscience of the country demands that the attitude of Government toward this foe of business, home, and liberty, as toward other foes of the public good, shall be one of uncompromising hostility.

The prohibiting of maddening poison is not a "sumptuary law": that is, a law against luxury—but rather a law to promote luxury; to give every year to the impoverished families of those who waste their money for drink, in place of it, a billion dollars' worth of pianos, books, pictures, etc.

Prohibition is consistent with liberty in the same way as fire-escapes and quarantines are. A prohibitory liquor law is a law for the promotion of commerce, for the protection of labor, for the prevention of cruelty and crime, for the preservation of health, and home, and liberty.

The capital that is invested in the liquor business, if invested in legitimate forms of trade, would give employment to hundreds of thousands more people than are now employed by it. This added number of workers would be needed in mills and shops, if the money spent for drink were turned into those channels of trade where there is a "fair exchange," and so "no robbery."

Not only life, but liberty itself, is menaced by alcohol. In the words of the *Catholic Review*, "There is nothing fanciful in the assertion that in most of the large cities the saloon-keeping interest has as much representation in the Common Council as have all other interests combined—that is to say, the minor

Arguments.

ity in numbers, intelligence, and decency, governs the majority in most of our large cities." It is this "spoils system" of the saloons that civil service reformers should strike at, if they would cure political corruption at the root. It is not so much examination of office-seekers as extermination of these office-brokers of the saloon that is needed. Municipal reformers also should learn that it is not by a change in the Mayor's office, but by a change in the saloon, that city politics is to be purified. If our city politics is in slavery to the saloons to-day, when the States are able to restrain them by their yeoman majorities in the legislatures, what of the time when the cities shall have the majority of our voters, as they will only eight Presidential elections from now—the third national campaign in which the babes now in your cradles will vote? In 1920, at the present rate of growth, cities of above 8000 inhabitants will have a clear majority of the voters of the country. The peril is not even so far off as that, for the cities have to-day a power out of proportion to their numbers as compared with country districts, because their forces are more concentrated, and better organized. And besides this, the saloon has carried city corruption into the country, except where local option, or some other form of Prohibition, has barred the way. "Ireland sober is Ireland free." So we may say of our own country: America's liquor or its liberty must go.

There is reason to believe that alcohol may be not only universally prohibited in our country, but also annihilated. The *Journal of Chemistry* has shown that the dangerous exceptions made for its use in medicine and the arts are unnecessary, since science has safer substitutes (see *The Temperance Century*, p. 87). It is also to be remembered that the passion for alcohol is not a natural passion, like sexuality, but wholly artificial, making it an evil like slavery, that may be wholly obliterated. It may not be wise to prohibit any but the beverage use of alcohol until a generation of physicians, intelligent enough to doctor without this dynamite, has been raised, but the goal which we should set before us should be, after Prohibition, annihilation. WILBUR F. CRAFTS (in the *Cyclopedia of Temperance and Prohibition*).

A most observable fact in the temperance reform has been its constantly widening range. It started in individual action, but passed almost immediately into various kinds of association for mutual aid. Indeed, this transition may be looked on as the first step in temperance as a reform. From a guarded use of intoxicants, pressed by the exigencies of the case, it moved forward to their absolute rejection. In a similar way it was forced beyond individual abstinence into civic Prohibition. From Prohibition in towns and counties, it advanced to constitutional Prohibition in the State, and from this it is advancing to Prohibition by the general Government. Each of these steps has been taken because of the necessary widening of the conflict and the need for more resources in meeting it.

Some may look upon this constant increase of demands as evidence of the impossibility and futility of the entire movement. The believers in Prohibition regard it as the inevitable result of the breadth and unity of those social relations which inclose us. We cannot win our own without seeking like gifts for all. Each step of extension makes the previous position more secure. We are compelled to conquer a boundary, or lose what we have already gained, and that boundary is the world. A nation doubtless offers a fairly defensible unit in this strife, and yet, the moment we achieve this success, we shall become increasingly sensible of an outside pressure from other nations opposed to us in sentiment and action. International cooperation is necessary to make Prohibition effectual. This was recognized by the powers bordering on the North Sea, when, perceiving the dire consequences of intemperance among the fishermen in those waters, they joined in promulgating the celebrated prohibitory agreement of 1887. The absolute and sweeping prohibitory law for the Samoan Islands, against alcoholic beverages of all kinds, incorporated in the treaty for the government of those islands, drawn up in Berlin in 1889 by the plenipotentiaries of the United States, Great Britain, and Germany (and subsequently ratified by the three powers), is another instructive instance.

The most constant and obviously influential activity which unites us to other countries is that of commerce. Commerce is a chief medium to the better as well as to the worst influences that lie between different peoples and races. Notably, three forms of trade—that in slaves, that in opium, and that in rum—have carried with them the most terrible evils and drawn out the most brutish and diabolical passions. The black man is debauched immediately and completely by intoxication. For a nation like the United States to suffer such a commerce on the part of its subjects is to impose a collective responsibility on each citizen for a line of action which is simply devilish in every phase of it.

More than ten millions of gallons of liquor are annually sent to West Africa, where it is known to work mischief of the most unqualified, speedy, and unprovoked kind. Germany, the Netherlands, the United States, France, and Great Britain are engaged in the traffic—Germany well in the lead.

There is no complete redemption within the nation unless there is redemption beyond it. One reason why Massachusetts is not ready for Prohibition in her own borders is the profit attendant on the extended and thriving trade of Boston in New England rum. It is not possible that a State which is not prepared to protect its own feeblers citizens from the extreme danger of this traffic should be ready to shield savage life, hidden away in the dark recesses of Africa, from greater disorder. Nor is it any more possible that a temper, unscrupulous in places remote and secret, should become tender and conscientious at Home. JOHN BASCOM (in the *Cyclopedia of Temperance and Prohibition*).

II. RESULTS OF PROHIBITION.

Benefits of Prohibition.—The practical trial of the Prohibition policy in the United States has been interfered with by many and serious difficulties. Great as is the extent of territory, in the aggregate, where experiments have been made since the agitation began, this policy has never had the advantage of a systematic introduction and broad foundation. The National Congress has never enacted general prohibitory legislation, and has never given support to or even recognized the prohibitory measures adopted in States and localities: indeed, the attitude of the Federal Government for nearly 30 years has been in formal antagonism to Prohibition. The States, with very few exceptions, have uniformly (or with but brief intervals of Prohibition) permitted license under certain conditions—conditions that, in

Not Fairly Tried. practise, have effectually excluded prohibitory law from most of the chief centers of population. Thus, in New England, while two States (Maine and Vermont) have been constantly under complete Prohibition for a long term of years, the other four States (Massachusetts, New Hampshire, Connecticut, and Rhode Island), though nominally prohibiting the traffic at times in that period, have so far inclined to license as to give continuance to liquor manufacture and commerce in such cities as Boston, Portsmouth, New Haven, Hartford, and Providence. Kansas and her complementary Prohibition State of Iowa have for years stood alone at the West; meantime the neighboring license States of Nebraska, Minnesota, Illinois, and Missouri, with their great cities—Omaha, St. Paul, Minneapolis, Chicago, Peoria, Kansas City, and St. Louis—have been aggressively hostile to prohibitory laws and diligently sought to flood the Prohibition districts with liquor. There is no Prohibition State or county, city, village, or township where the success of the policy is not or may not be at any time endangered by the interference of the liquor trade in license States, counties, or localities close at hand.

The police power, which is everywhere vested in the local governments and can always be supplemented and made more effective by cooperation from county and State authorities, is theoretically sufficient for the upholding of prohibitory as well as all other laws and for the correction of offenses committed by unscrupulous outsiders; indeed, there has been no serious limitation of the right of each political division having prohibitory law to fully enforce the law, except during the few months of 1890 in which the "Original Package" decision of the Supreme Court caused confusion—and the disturbance resulting from this decision was soon brought to an end by Congressional legislation. But though theoretically sufficient, the local police power is inadequate practically so long as liquor is produced, and is a legitimate article of commerce in other communities, counties, and States. All the conditions for a troublesome contraband traffic exist. Under the most stringent Prohibition there will always be some, and

oftentimes there will be many persons desiring drink or ready to purchase it if opportunity offers. Liquor is an article easily concealed, and the tricks and devices by which it can be peddled are numberless. The profits promised by illicit enterprise are large and are quickly won. Individual citizens who are not under suspicion may ship in supplies without very great risk, for the search and seizure clauses of prohibitory statutes, for manifest reasons, are not vigorously applied until there is good ground for believing that a particular person is actually disposing or preparing to dispose of liquor in violation of law. Above all, the highways of inter-State commerce are everywhere open to the smugglers. By a decision of the United States Supreme Court* no Prohibition State can, without the consent of Congress (not yet granted), prevent an inter-State railway or express company from carrying to any point within its borders liquor brought from another State. Shipments of liquor from Boston to Portland, for example, are held to be valid shipments by the courts, and if the shippers use careful disguises the "goods" may escape detection by the police officers of Portland and be delivered to citizens of that town. Once delivered they may be surreptitiously sold or given away, and have a more or less potent effect for neutralizing the law of Maine, in accordance with the shrewdness of the men into whose hands they come, and with various local conditions.

Unfavorable local conditions constitute the next great impediment to the success of Prohibition. Under this head, indeed, all the secondary difficulties fall: for all difficulties are secondary in comparison with the one already noticed—the presence of a legalized traffic in neighboring States and places. The chief of the local difficulties undoubtedly arises from the failure of the controlling political parties to earnestly identify themselves with the cause of Prohibition. This is not at all equivalent to saying that the people, as the source of parties and of government, are fundamentally responsible in cases of neglect or opposition; for the existence of Prohibition implies that popular consent and approval have already been granted. An indifferent or a hostile partizan attitude is frequently if not always taken without regard to genuine public sentiment—at least without regard to the sentiment of the best citizens; party action is controlled by designing leaders, and leaders are readily influenced against Prohibition by aggressive demands, bribes, threats, and promises of support from the liquor element. Thus it has happened nearly everywhere that Prohibition has not enjoyed the cordial political support necessary to its full success. Statutory provisions for enforcement have been lamentably defective; penalties have been inadequate and so adjusted, at times, as to render illicit trade scarcely more perilous than licensed trade would be under a stringent license system; men personally opposed to

* The famous decision, rendered in 1888, which became the foundation for the "Original Package" decision. *Bowman v. Chicago and Northwestern Railway Company*, 125 U. S. 465.

Prohibition, or deliberately pledged to its organized foes, have been chosen to fill the offices most intimately connected with the administration of law—as judges, prosecuting attorneys, mayors, sheriffs, aldermen, police authorities, etc.; juries have been packed with saloon adherents—in short, it has often seemed that the entire machinery of government has been given over to the outlawed traffic. The tireless persistence of all the violators of law, the encouragement shown them by an insinuating and sometimes incendiary press, the timidity of many friends of the law, the lack of determined leadership, and the coldness or reactionary tendencies of numerous good citizens (not excepting an element of the clergy) are other local impediments to the enforcement of Prohibition that are repeatedly encountered.

The admission that there have been partial or complete failures does not affect the vital question, Would thoroughly enforced Prohibition be beneficial?

Experience. But this admission suggests a practical question that cannot be ignored—in view of the many acknowledged disappointments, and of the above-considered difficulties, is the effort for thorough Prohibition practicable, and if not, are the benefits of partial Prohibition such as to justify enacting a prohibitory law that may be only partially effective?

In sifting the great mass of testimony that every patient inquirer may easily gather, it is difficult to adopt an entirely satisfactory method of classification. It is desirable, for instance, to make a separate and detailed comparison of results obtained under State laws with those secured under local option, high-license, and low-license systems; again, the reader will wish to have a separate and comprehensive analysis of the effects of Prohibition upon arrests for crime, and other distinct and equally extended exhibits of the influence that it exerts as a corrective of pauperism, etc.; again, it is proper to show separately how Prohibition has affected commercial prosperity, taxation, the interests of education, etc. But the results of Prohibition in one direction are closely associated with its results in all other directions, and a formal classification would involve endless repetitions. For the purposes of this article the testimony will be presented under two heads: (1) Diminution of the Consumption of Drink, and Effects upon Crime and Kindred Evils; (2) Economic and Other Effects.

In beginning an examination into the strictly temperance results of prohibitory laws nothing is more suggestive than the unanimity and the vigor with which such laws are opposed by all engaged in the liquor traffic. "*Resolved*, That we are unalterably opposed to Prohibition, general or local," said the National Protective Association at its first convention. "*Resolved*, That we are an anti-Prohibition Association, pure and simple," declared the New York State Brewers' and Maltsters' Association in 1883. "We have had a great deal of business in the State of Iowa, both before it was Prohibition and since," wrote the chief

distiller of Nebraska in 1888, "and we can say positively there is very little satisfaction in doing business in that State now. Ever so often the goods are seized, and it causes a great deal of delay and trouble to get them released; and there is a fear of not getting money for the goods, and all the forms we have to go through make it very annoying business. It is like running a railroad under ground. You don't know where you are going or what is ahead." Few will deny that the policy which is most hurtful to the liquor trade must be most instrumental in modifying the evils of intemperance. In the uncompromising hostility with which the "trade" meets every attempt to establish Prohibition lies a strong indication of Prohibition's effectiveness as a temperance measure.

MAINE.

Neal Dow, the "Father of the Maine law," describes the woful conditions prevailing in that State before the enactment of Prohibition. He says that immense quantities of rum were distilled and consumed there, and that the large home supply was supplemented by a great deal of rum imported from the West India Islands. In another place he has made this declaration: "I think I have seen nearly an acre of puncheons of West India rum at one time on our wharves, just landed from ships. All this time seven distilleries [in Portland] running day and night! Now I will venture to say that we have not had a puncheon of West India rum imported here in five years—yes, I will say ten years, and there is but one distillery in the State, and that not running, I think; but if it runs it is laid under \$3000 bonds to sell no spirit except for medicinal or mechanical purposes or for exportation."*

These statements are confirmed with the strongest emphasis by well-nigh all the eminent men of Maine. It is impossible in this article to make even a summary of all the important testimony.

The Voice for October 9, 1890, printed letters from the two United States Senators from Maine and other distinguished citizens. Senator William P. Frye wrote, in part:

"I can remember the time when in the State of Maine there was a grocery store at nearly every four corners in certain portions of the State, whose principal business was in the sale of New England rum; when the jails were crowded and poverty prevailed. To-day the country portions of the State are absolutely free from the sale of liquor; poverty is comparatively unknown, and in some of the counties the jails have been without occupants for years at a time. Wherever the laws have been rigidly enforced this condition of things has been the invariable result. The people who have tried and witnessed the result of these prohibitory laws adopted a few years since a Constitutional Amendment, prohibiting the sale or manufacture of liquor, by an overwhelming majority.

"The Democratic party for many years after Prohibition was adopted denounced it in every party platform, but for the last 12 or 15 years—such has been the progress of the temperance sentiment under the law—they have not dared to do so. This year they made a feeble attempt in that direction and were completely snowed under. . . .

"The law is not a failure; it has been, on the other hand, a wonderful success. I do not mean to assert, of course, that there is no liquor sold in our large cities

* *Alcohol and the State*, p. 352.

where evasions of law are so much more easily found than in the country. We have laws against murder and theft, but no man is so insane as to suppose that under their influence there will be no murder or stealing."

Senator Eugene Hale wrote :

"Throughout the State generally the prohibitory law has driven out the grog-shop, and while liquor is undoubtedly sold in the larger towns and cities, it is not done in an open way, and the amount of liquor-selling is smaller even in these larger towns and cities than in corresponding places elsewhere. Maine people believe in Prohibition because they are every-day witnesses to its good effect."

This letter received the unqualified indorsements of all the other members of Congress from Maine, of the two United States Senators, and of the Hon. James G. Blaine, as follows :

James G. Blaine: "On the point of the relative amount of the liquors sold at present in Maine and in those States where a system of license prevails, I am sure, from personal knowledge and observation, that the sales are immeasurably less in Maine."*

Hannibal Hamlin, United States Senator from Maine, and formerly Vice-President of the United States: "I concur in the statements made by Mr. Frye. In the great good produced by the prohibitory liquor law of Maine, no man can doubt who has seen its results. It has been of immense value."

Lot M. Morrill, United States Senator from Maine: "I have the honor unhesitatingly to concur in the opinions expressed in the foregoing by my colleague, Hon. Mr. Frye."

John Lynch, Member of Congress from Maine: "I fully concur in the statement of my colleague, Mr. Frye, in regard to the effect of the enforcement of the liquor law in the State of Maine."

John A. Peters and Eugene Hale, Members of Congress from Maine: "We are satisfied that there is much less intemperance in Maine than formerly, and that the result is largely produced by what is termed prohibitory legislation."

In 1874 the Governor-General of Canada, in accordance with a request from the Dominion Parliament, appointed a special commission "to inquire into the working of prohibitory liquor laws." This commission devoted much attention to the results in Maine, and the following questions were submitted by it to many citizens of that State, including both friends and opponents of the law: "Is the liquor law enforced, and if not, what is the hindrance to its working?" "What have been the results of a change from Prohibition to license, or *vice versa*?" Mr. E. J. Wheeler, in his *Prohibition* (p. 111), says: "In the replies received to these two questions, one thing is especially noticeable, namely, that while many, especially those resident in Portland and Bangor, admit that there is a lax enforcement of the law, yet all, without exception, testify to the good results of the law even when it is poorly enforced."

The original Maine law (with search and seizure clauses) was enacted in 1851. In 1856 it was repealed and a license law was substituted, which continued in force during the years 1857-58; and in 1859 Prohibition was readopted.

The history of the Maine law in Portland and Bangor proves that it caused a marked

* In 1882 Mr. Blaine added this declaration: "Intemperance has steadily decreased in Maine since the first enactment of the prohibitory law, until now it can be said with truth, that there is no equal number of people in the Anglo-Saxon world among whom so small an amount of intoxicating liquor is consumed as among the 650,000 inhabitants of Maine."

change for the better in those cities. Whenever it has been rigidly enforced the result has been no less wholesome. But it is recognized by the Prohibitionists that the administration of the law for some time has been unsatisfactory in Portland, Bangor, and (in a less degree) a few other towns. For these imperfections of execution the political managers are chiefly to blame: they find it profitable to permit rum-selling to a certain extent, since the illicit dealers are men of influence with a large element of the city voters, and as men who stand constantly in danger of arrest and punishment, they are subservient and most active supporters of the politicians upon whom they rely for protection.

KANSAS.

The results of State Prohibition in Kansas have been no less instructive and important than those in Maine. Kansas formerly contained some of the most notorious towns of the West, in which life was held at a very cheap rate and wild disorder was a characteristic condition. Vile saloons abounded in these places, and the consumption of liquor was appalling. In 1880 the Prohibitory Constitutional Amendment was adopted by a majority of less than 8000 in a total of 175,000 votes. This small majority gave no assurance of the successful enforcement of the policy, and the cities refused to regard it as binding and proceeded to treat the law with systematic defiance. An agitation for repeal immediately sprang up and it seemed to have reached a triumphant culmination when in 1882, chiefly on the question of the resubmission of the amendment, the large Republican majority in Kansas was wiped out, Governor John P. St. John, the man most prominently identified with the cause of Prohibition in the State, was defeated in his candidacy for reelection.

All these circumstances render the ultimate success of the prohibitory law the more significant. Despite the seeming reaction and the continued efforts of a desperate and powerful rum element, the measure was steadily winning its way to popularity because of the beneficial results that attended every honest attempt at enforcement. Previously to 1885 the legislation enacted was comparatively weak; but in that year stronger provisions were added, including injunction and nuisance clauses. In 1837 the celebrated Murray act was passed, prescribing severe penalties, with radical restrictions for the drug-store traffic. In the same year a law granting full municipal suffrage to women was secured. A metropolitan police law was another helpful measure. The Kansas legislation of 1885-89 constitutes, indeed, the most remarkable series of prohibitory statutes ever adopted, far outstripping the legislation of Maine. Meanwhile the State courts had thoroughly sustained every act. Some embarrassment was occasioned by the manifest hostility of the Federal judges having jurisdiction in Kansas, especially by Circuit Judge Brewer's famous decision (1886) in favor of compensation to liquor-manufacturers; but the friends of the law felt confident

that every disputed point would ultimately be decided against the traffic, and the general interests of enforcement did not suffer. Local judges in some of the worst rum cities, like Leavenworth, placed obstacles in the way of the cause locally; but even these exceptional difficulties were overcome in most instances. It was not until the "original package" trade of 1890 was developed that the enemies of the law enjoyed a general success; yet this success was short-lived.

There can be no better demonstration of Prohibition's good work in Kansas than the increasing stringency of the statutes and the growing cordiality of popular attitude. Against all the disadvantages to which we have alluded, and despite a reaction that appeared to be overwhelming; against the bitter opposition of the saloon people and the most persistent efforts at nullification—efforts in which the liquor power of the whole country and especially the dealers of neighboring States joined—the law has not only been maintained, but has been steadily strengthened. Moreover the benefits of the law have changed former foes into warmest friends: men of the highest position, governors, senators, mayors, and leading citizens of every class, who were intensely hostile or profoundly distrustful, have been constrained to testify in unequivocal and even enthusiastic language to the great good done by Prohibition.

The abundance of proof is bewildering, and only a small portion of it can be given in this article. Endeavor will be made to atone by careful selection for necessary faults of omission.

Bearing in mind the untrustworthiness of the United States Internal Revenue statistics as to the "liquor-dealers" in Prohibition States, the following table, showing the numbers of persons paying United States retail and wholesale special liquor taxes, with the numbers of distilleries operating, and brewers in Kansas, for each year, from 1880 to 1889, inclusive (compiled from official data), is instructive:

YEARS.	Retail Dealers.*	Wholesale Dealers.†	Distilleries Operating.	Brewers.	Totals.
1880.....	1907	56	4	39	2006
1881 ‡.....	1188	39	8	25	1260
1882.....	1512	34	2	22	1570
1883.....	1949	49	2	9	2009
1884.....	2025	46	4	17	2092
1885.....	2157	57	4	11	2223
1886.....	2401	46	2	8	2457
1887.....	2182	59	3	5	2249
1888.....	1396	34	1	4	1435
1889.....	1350	28	1	3	1382

*Including "retail liquor-dealers [distilled]" and "retail dealers in malt liquors."

†Including "wholesale liquor-dealers [distilled]" and "wholesale dealers in malt liquors."

‡Including Indian Territory for this year and subsequent ones.

Population of Kansas in 1880, 996,096; ratio between the number of "liquor-dealers," etc., and the total population, 1 to 496. Population in Kansas in 1890, 1,427,096; ratio between number of "liquor-dealers," etc., in 1889 and total population in 1890, 1 to 1033.

It is not, however, by showing a proportionate reduction in the number of persons connected (or nominally connected) with the traffic that the effects of Prohibition upon the liquor trade are to be demonstrated. High-license experiments have taught that the number of liquor establishments may be very materially diminished without disturbing the supply or the consumption.

From the Federal returns of the quantities of liquor manufactured,* the following table for the State of Kansas has been prepared:

YEARS.	Distilled Liquors Produced.	Malt Liquors Produced.
	Gallons.	Barrels.
1880.....	42,779	32,270
1881 *.....	65,086	25,872
1882.....	25,786	24,281
1883.....	2,859	25,103
1884.....	5,107	25,437
1885.....	6,730	19,274
1886.....	37,613	17,369
1887.....	9,133	16,458
1888.....	1,090	14,170
1889.....	751	8,290

* Including Indian Territory for this year and subsequent ones.

Production of spirits per capita in Kansas in 1880, 0.043 gallon; in 1889 (on the basis of the census of 1890), 0.0005 gallon. Production of beer per capita (reckoning 31 gallons to the barrel), in 1885, 1.004 gallon; in 1889 (census of 1890), 0.18 gallon.

The most competent observers have added specific evidence of the practical ruin of the retail business throughout the State. Surely no individuals are better qualified to speak concerning the extent of the traffic than the Probate Judges of the various counties. With them rests the responsibility for hearing and granting applications to sell liquor for the excepted purposes; and they are charged also with the duty of receiving and inspecting the returns of sales made by all lawful vendors. In 1889 *The Voice* (cf. New York City) applied to the Probate Judges of the 106 counties of Kansas for information as to the effects of the law; and, among other questions, the following were asked: "How successfully has Prohibition closed the saloons in your part of the State?" and "To what extent, in your judgment, has it diminished drunkenness and the consumption of intoxicants for beverage purposes?" There were replies from 97 counties; for 75 of the counties the answers were written by the Probate Judges personally, and for the other 22 counties, by county treasurers, or other officials, or by prominent private citizens. Every reply, whether favorable or unfavorable to Prohibition, was summarized by *The Voice*. Ninety-four of the writers declared positively that there were no open saloons, while the other three made qualified reports. Ninety-two stated that drunkenness and the consumption of drink had been greatly diminished. A majority, in estimating the extent of the diminution, placed it at from 75

* Internal Revenue Report for 1889, pp. 366-69.

to 90 per cent.; others said that drunkenness and drink had been "entirely eradicated" in their parts of the State, or "almost totally," or were "too small to estimate," etc.*

IOWA.

The original prohibitory law of Iowa (1855) was speedily modified, so as to practically permit the manufacture of all kinds of liquor, and the sale of beer and wine, tho the sale was made subject to local option. Special encouragement seems to have been given in Iowa to the manufacturers of liquor, especially beer. Many Germans were attracted to the State, and the brewing business steadily expanded until, in 1882, more than 286,000 barrels was produced. The distilling trade also acquired much importance; one of the greatest distilleries in the world was built at Des Moines, and in 1883 (the year of the adoption of the prohibitory amendment), more than 4,500,000 gallons of spirits was distilled in Iowa. Under such circumstances the majority of nearly 30,000, given by the people for constitutional Prohibition was a great victory for the principle. It was followed up by so vigorous a display of strength that, altho the State Supreme Court declared the amendment invalid on technical grounds, the legislature promptly enacted enforcement legislation, which was subsequently improved. The Clark law, with its nuisance and injunction features, and the Pharmacy law, take rank with the most rigid acts of Kansas. These measures have been retained intact, and during the largest part of the period since 1885, have had the moral support of the State Government. There has never been a reasonable doubt that an overwhelming majority of the people have fully sustained Prohibition in Iowa, and desired its complete enforcement; and the pressure brought by them has been so powerful that in most of the cities a marked progress toward the extermination of the traffic has been observable. But political complications, and the artful schemings of influential men, have had much more serious effect in Iowa than in Kansas. In 1894 a Mulct law was passed, the prohibitory statute remaining technically in force, but providing that the payment of a set tax would protect sellers from prosecution for violation of the law.

OTHER EXPERIMENTS IN STATE PROHIBITION.

In existing circumstances the decision of the question whether State Prohibition has wholesome practical effects, if executed with tolerable fairness, rests mainly upon the conclusions coming from a thorough study of Maine, Kansas, and Iowa experience; for these are the only States in which there has been anything like an adequate and a prolonged trial of the policy throughout a broad extent of territory embracing considerable cities and peopled by enterprising classes of citizens. In every other State that has tried Prohibition some or all of the elements essential to significant results have been lacking; generally the enforcement

legislation has been defective; in most instances even these feeble measures have lasted for only two or three years; discriminations have been made permitting the sale of wine and beer, and the manufacture of these and other liquors; political favor has rarely been exhibited, and nearly always there has been a general disposition to conspire for the law's nullification and repeal. Nevertheless, it will be seen that good has been done by even very imperfect and transitory Prohibition systems—good proportioned to the degree of the enforcement—and that conditions under the weakest prohibitory laws have been decidedly better, from the temperance and anti-liquor traffic point of view, than under any method of license in the same States.

Vermont.—Its prohibitory law was passed in 1852 and has never been repealed; therefore Vermont has had continuous Prohibition longer than any other State, not excepting Maine—for in Maine there has been an interval of license (1857–58). Besides, the statute has had the general support of the people, and has encountered little opposition from public men. But Vermont is not one of the representative States. Its commercial interests are not in a conspicuous way "diversified," its towns are relatively few and small, its citizens are conservative, and its population does not show a characteristic commingling of the varied elements of American life. Thus the results of Prohibition in Vermont are not decisive, because the circumstances do not bear the tests that are naturally applied.

The number of persons paying retailers' and wholesalers' special taxes varies slightly from year to year; even the Federal returns demonstrate that the traffic is not increasing. The average number of such payers for the eight years is 522. The population has been practically unchanged since 1880, and therefore, reckoning on the basis of the population in 1880, there was, on the average during this period, one special taxpayer for each 637 of the population. Vermont's showing is still more creditable when it is remembered that some of the so-called "liquor-dealers" were "town agents" selling for medicinal and similar purposes exclusively, and that many of the others were undoubtedly persons selling transiently, in a small way, and whose influence for evil in the community was not comparable with that exerted by even the petty dealers in the license States.

North and South Dakota.—These two States rank next in present importance, for both have complete Constitutional Prohibition. Previously to 1890 they were under a system of high license and local option, and in a majority of the counties the traffic was prohibited. The results of local prohibition, compared with those of high license, were so satisfactory that the farmers of South Dakota compelled the dominant party to pledge itself unequivocally to State and national Prohibition and to work for the adoption of the Constitutional Amendment; while in North Dakota the benefits of the policy were so clearly recognized that a Prohibition majority was given in 1889, notwithstanding a general

* *The Voice*, June 13, 1889.

feeling among the Prohibitionists that it was useless to strive for victory against the tactics and resources of their opponents.*

New Hampshire, permitting the manufacture of liquor and influenced in its politics to a great extent by wealthy brewers, is not strictly a Prohibition State. Even the prohibition of the retail sale did not finally become absolute until 1881, when the right granted to towns to tolerate the traffic in lager beer was withdrawn. As a matter of course, this partial prohibitory law has not operated so successfully or beneficially as the measures already noticed.

ECONOMIC EFFECTS.

The relation of the liquor traffic to economics, says James C. Fernald in his *Economics of Prohibition*, is one which the masters of the science have scarcely begun to touch. He says :

"Liquor selling does not pay. . . . Tell the lumbermen of Michigan how many thousands of drinking farmers will shingle their homes and barns, or build new ones, as soon as they 'quit their meanness,' and how many thousands of houses will be built in all our suburbs for the working men when none of them drink away the money that might pay the rent, or buy the cottage. Show the shoe manufacturers of Massachusetts what it means to take all the bare feet of drunkards' children off the ground. Let the iron men of Pennsylvania know that new stoves will be at once needed in a hundred thousand homes, when the saloon-keeper ceases to get the money. Tell the miners they will have work all winter through, getting coal enough to put into those stoves. Tell the cotton-planters of the South that there will be about 10,000,000 new calico dresses and aprons wanted as soon as the 2,000,000 tipplers cease to tittle, and go home with some spare change. Let the ranchmen of Dakota and New Mexico, and Armour's men in Chicago, know that there's going to be beef on thousands of tables, where now are a few cold potatoes, as soon as we can carry Prohibition. Tell the wool-grower of Ohio that everybody in this country is going to be wrapped in woolen and sleep under blankets when the blizzards blow, and the thermometer ranges about zero, and men no longer heat up with liquid fire in order to exterminate their families with atmospheric cold. Tell the grocer he can sell for cash, and say good-by to bad debts, when the dimes no longer go into the saloon till. Tell the farmer there is going to be an unheard-of demand for flour, and meal, and butter, and cheese, and eggs as soon as the bloated beer-holders cease fostering that industry, and begin filling out the hollow cheeks of wives and children."

In the chapter headed, "Paying the Piper," he says :

"The people of the United States are spending for intoxicants more than \$1,100,000,000, and increasing the expenditure at the rate of about \$50,000,000 a year. What nation can long endure such a drain? How can we help having poverty and distress?"

"The immensity of the outlay can be seen by considering the further fact that the total of imports of the United States in 1888 were but \$723,879,813, and the customs duties collected on the same were only \$219,031,173.

"This \$1,100,000,000, then, is the cost to the drinkers of the nation. From this we should deduct, according to Mr. E. J. Wheeler,* \$124,000,000 as the total receipts from all forms of tax and license paid by the liquor traffic to the nation and the States. This would bring the actual cash loss to the nation a little below \$1,000,000,000. But the selling price of both beer and whisky is estimated so low in the above table that we may claim the benefit of the margin, and safely hold the entire loss to be not less than \$1,000,000,000.

"A thousand million dollars in a single year, and this going on steadily year after year! It would have bankrupted the Roman Empire, when her nobles

dined luxuriously on peacocks' brains. It would have bankrupted Spain, when the wealth of the New World was pouring in, and her knights shod their steeds with silver. If any foreign power were to demand such a tribute, we would turn this whole country into an armed camp, and put a musket into the hand of every 14-year-old boy sooner than pay it. But we patiently hand it over to our 150,000 liquor barons, and only beg them to have a little mercy, and give us a rest for part of Sunday, and from midnight to daylight on other days.

"Still, this estimate only touches the outer edge of the deficit. Every man who drinks loses from labor a steadily increasing amount of time. It is probable that, from first to last, he loses an amount of time equal to the cost of his drinks. If this estimate were to be allowed, it would just double the \$1,000,000,000. But it would probably be challenged, and be thought weakest where it is strongest. Men would be cited who drink hard and work hard to the day of their death. But they die in the midst of their strength, and the loss is of all the years they might have lived. If the hard drinker lives much beyond 30, infirmities, sicknesses, and incapacity increase rapidly upon him, with their inevitable loss of working time and power. For the man who goes on 'sprees,' there will be days of lost labor from a few hours' debauch. By the most moderate computation, which, I believe, has not been challenged, there is lost the labor of 700,000 drunkards, amounting to \$175,000,000, and enough of the labor of 2,000,000 tipplers to make about \$225,000,000—a total of \$400,000,000 every year.

"But drinking men often become paupers, or pauperize those dependent upon them. Sixty-seven thousand inmates of almshouses were reported to the Census Office in 1880. Their support, by the average of many institutions, may be put at \$100 each per year, making a total of \$6,700,000. The amount of outdoor relief given can be only distantly approximated. In the State of New York, where the cost of maintaining paupers in county poorhouses is \$678,037.76, the outdoor relief given in the same counties is \$498,896.10, or about two-thirds. Supposing this ratio to exist throughout the country, that would give \$4,466,666 for outdoor relief. This is far below the true amount, for it makes no account of private charity as exercised by churches, lodges, and individuals, which would mount up to millions more.

"Adding the \$4,466,666 of estimated outdoor relief to the \$6,700,000 infirmity expenses, we have \$11,166,666 for National pauperism. Dr. Hargreaves ascribes nine-tenths of this to intemperance. We are willing to put it at three-fourths. It hardly can be less than that. . . . Three-fourths, then, of the total \$11,166,666 would be a little over \$8,000,000, which we may take as a thoroughly safe estimate of the pauperism due to intemperance.

"Drinkers often become criminals. Here, too, adequate statistics are exceedingly difficult to obtain. Mr. Wines says, in his pamphlet on *Crime, the Convict, and the Prison*: 'The problem involves many elements, some of which are very obscure.' He takes the number of inmates of prisons and reformatories, as given in the census of 1880, at 70,000, and remarks: 'Assuming that the charge for keeping up the prisons, including buildings and repairs, is not less than \$200 a year for each prisoner, this item of expense will amount to nearly, or quite, \$15,000,000 annually.' He adds an estimate of the cost of arrest and trial, and says: 'These three items, taken together, constitute the enormous sum of \$50,000,000 annually, raised by taxation, to defend the community against the ravages of crime.'

"Some question might be raised about institutions where the labor of prisoners is utilized, so that they are self-supporting. These are chiefly penitentiaries, where the prisoners are of adult age and sentenced for long terms. In jails, and juvenile reformatories, and workhouses this would not be the case. Even if we were to allow a deduction for this, it would probably be more than compensated by the fact which Mr. Wines states, that his estimate does not include the cost of the private detective force, the sums paid by the accused to their attorneys, nor the losses to individuals resulting from successful frauds or depredations.

"But this is not all. Mr. Wines says: 'It is startling to know that, of 50,000,000 inhabitants (in 1880), over 400,000 are either insane, idiots, or deaf-mutes, or are inmates of prisons, reformatories, or poorhouses. If to these we add the outdoor poor and the inmates of private charitable institutions, the amount will swell to nearly, or quite, 500,000, or one per cent. of

* *Prohibition, the Principle, the Policy, and the Party*, p. 73.

the population.' At that rate the number would now be about 600,000. But we will keep to the records of 1880, and consider only the 400,000 who were inmates of charitable institutions. Of that number, the 70,000 who were prisoners, and the 67,000 who were paupers, have been already considered. Those deducted would leave 263,000 'defective persons.' Assuming the average cost of their maintenance to be \$20 (and in many of these institutions it runs to nearly \$300 per capita, as skilled teachers and physicians must be employed at great expense), the cost of maintaining these 'defective persons' would exceed \$52,000,000. If we estimate one-third of these disabilities to be due to intemperance, actual or inherited, we shall have \$17,000,000 annual loss to the nation from the insanity, blindness, deafness, and other disabilities which intemperance produces. . . .

"Drink produces sickness. A careful computation gives about 150,000 persons simultaneously sick in the United States, as the result of using intoxicants, at a cost of more than \$50,000,000. This does not include the number who are sick, because some one else uses them—the women and children starved, chilled, beaten, heart-broken, crowded into filthy, malarial alleys and cellars, for whom simple Prohibition would have the effect of the best kind of fresh-air fund all the year round. The sickness which is thus the indirect result of intemperance is at least equal to that which directly results. It is probably far greater, but we will put it down at another \$50,000,000—in all, \$100,000,000.

"But there are those who will object, 'You are not counting the receipts from this industry. The liquor business gives employment to 500,000 men, including all who work about brewery, distillery, and saloon.' But from the standpoint of political economy these men produce nothing. No addition to the national wealth comes from their labor. They must be counted and reasoned about simply as non-producers.

"Adding these various items, we have for the United States the following bill :

Lost labor of drunkards and tipplers.....	\$400,000,000
Lost labor of sober men.....	40,000,000
Pauperism.....	8,000,000
Crime.....	37,500,000
Insanity and disability.....	17,000,000
Sickness.....	100,000,000
Lost labor of liquor-makers.....	300,000,000
Total.....	\$902,500,000

"It is to be observed that these estimates are almost all based on the census of 1880. At that time the direct cost of intoxicants, as estimated by Dr. Hargreaves, was but \$733,816,495 for the year. With the increase in the consumption of liquor from \$734,000,000 to \$1,100,000,000, it is certain that these indirect losses must have advanced in equal proportion. That would make these items amount to not less than the direct cost now, or another \$1,100,000,000."

For temperance views contrary to Prohibition, see HIGH LICENSE ; NORWEGIAN SYSTEM ; NATIONALIZATION OF THE LIQUOR TRAFFIC ; SOUTH CAROLINA DISPENSARY SYSTEM.

For facts indicating that intemperance is not so far responsible for poverty as is here argued, see POVERTY. See also INTEMPERANCE.

PROHIBITION PARTY, THE.—The following account of the Prohibition Party is contributed by prominent leaders of the party.

The Prohibition party was established in 1869 on the basis of uncompromising opposition to the drink traffic and to all parties not harmoniously and unmistakably pledged against that traffic, and has been steadily

maintained since then (though with occasional slight changes of name).

In the early struggles for Prohibition (1850-60) it was generally agreed that the policy should stand or fall in accordance with the spontaneously expressed will of the people, and politicians found few inducements to manipulate or resist public opinion, for the liquor traffic was not a great organized political power. The question whether the Maine law should be adopted in a State was submitted in good faith to the electors for decision, and an affirmative vote was followed by the desired legislation, which was retained on the statute-book as long as there was good reason for believing that a majority of the people—even though a passive majority—would object to its removal. At times, as in New York and Maine, there were noticeable developments of political antagonism and conspiracy, but these were exceptional. In the Prohibition literature of that period we find little to suggest the present radical tactics. It is considered a memorable if not an unparalleled circumstance that Rev. Charles F. Deems published, before the war, a newspaper which especially urged the importance of independent political action by the advocates of Prohibition. This journal was printed at Greensburg, N. C., in 1854, and only a few numbers were issued.

In the Civil War (1861-65) all political questions save the supreme questions arising from that conflict were lost sight of.

The liquor traffic was given a new footing by the Internal Revenue **Origin.** legislation. Brought into political prominence and schooled in political arts by its close relations with the Federal Government, the liquor element gradually asserted itself in State politics. No new prohibitory measure was enacted at the North during the war. Rhode Island's statute was repealed in 1863, other State laws were weakened, and nearly all were flagrantly violated. Soon after the restoration of peace, it became evident that the liquor traffickers were bent on sweeping away, by political operation, all the prohibitory legislation of the Union. In Massachusetts, the most populous of the Prohibition States, the rum-sellers made an aggressive political canvass in 1867, resulting in the election of a legislature which rescinded the law the next year. In Connecticut, in 1860, an active agitation for repeal was begun. In the same year the National Brewers' Congress (at Chicago, June 5, 1860) adopted the following resolution :

"Whereas, The action and influence of the temperance party is in direct opposition to the principles of individual freedom and political equality upon which our American union is founded; therefore

"Resolved, That we will use all means to stay the progress of this fanatical party, and to secure our individual rights as citizens, and that we will sustain no candidate, of whatever party, in any election, who is in any way disposed toward the total abstinence cause."

These and other evidences of serious political dangers aroused the Prohibitionists. As early as February, 1867, the State Temperance Convention of Pennsylvania declared that "if

the adversaries of temperance shall continue to receive the aid and countenance of present political parties we shall not hesitate to break over political bands and seek redress through the ballot-box." The Grand Lodge of Good Templars of Pennsylvania, at Pittsburg, June 10, 1860, passed a similar resolution, and the Right Worthy Grand Lodge of Good Templars (the supreme body of the Order), in session at Richmond, Ind., May 28, 1868, recommended "to the temperance people of the country the organization of a national political party whose platform of principles shall contain Prohibition of the manufacture, importation, and sale of intoxicating liquor to be used as a beverage."

In 1869 (at Oswego, N. Y., May 20), the Grand Lodge expressed the opinion "That we esteem the present as an auspicious period in the history of our political affairs for the inauguration of this movement, and therefore recommend the calling of a National Convention for the purpose at an early day." On this occasion a meeting of these favoring separate political action was held, with Jonathan H. Orne of Marblehead, Mass., as president, and J. H. Spencer of Cleveland, O., as secretary. The duty of preparing a call for a National Convention to organize a National Prohibition Party was assigned to a committee of five, composed of Rev. John Russell of Detroit, Mich., Prof. Daniel Wilkins of Bloomington, Ill., J. A. Spencer of Cleveland, O., John N. Stearns of New York, and James Black of Lancaster, Pa.

The organizing convention met in Farwell Hall, Chicago, on the specified day (September 1, 1869), with nearly five hundred delegates in attendance. At first it was decided to call the new organization the Anti-Dramshop party, but the convention finally named it the National Prohibition Party. The following is the text of the platform of principles adopted:

"Whereas, Protection and allegiance are reciprocal duties, and every citizen who yields obedience to the just commands of his Government is entitled to the full, free, and perfect protection of that Government in the enjoyment of personal security, personal liberty, and private property; and

"Whereas, The traffic in intoxicating drinks greatly impairs the personal security and personal liberty of a large mass of citizens, and renders private property insecure; and

"Whereas, The existing parties are hopelessly unwilling to adopt an adequate policy on this question; therefore

"We, in National Convention assembled, as citizens of this free Republic, sharing the duties and responsibilities of its Government, in discharge of a solemn duty we owe to our country and our race, unite in the following declaration of principles:

"1. That while we acknowledge the pure patriotism and profound statesmanship of those patriots who laid the foundations of this Government, securing at once the rights of the States severally, and their inseparable union by the Federal Constitution, we would not merely garnish the sepulchers of our republican fathers, but we do hereby renew our solemn pledges of fealty to the imperishable principles of civil and religious liberty embodied in the Declaration of American Independence and our Federal Constitution.

"2. That the traffic in intoxicating beverages is a dishonor to Christian civilization, inimical to the best interests of society, a political wrong of unequalled enormity, subversive of the ordinary objects of government, not capable of being regulated or restrained by any system of license whatever, but imperatively

demanding for its suppression effective legal Prohibition, both by State and National legislation.

"3. That in view of this, and inasmuch as the existing political parties either oppose or ignore this great and paramount question, and absolutely refuse to do anything toward the suppression of the rum traffic, which is robbing the nation of its brightest intellects, destroying internal prosperity, and rapidly undermining its very foundations, we are driven by an imperative sense of duty to sever our connection with these political parties and organize ourselves into a National Prohibition party, having for its primary object the entire suppression of the traffic in intoxicating drinks.

"4. That while we adopt the name of the National Prohibition Party, as expressive of our primary object, and while we denounce all repudiation of the public debt, and pledge fidelity to the principles of the Declaration of Independence and the Federal Constitution, we deem it not expedient at present to give prominence to other political issues.

"5. That while we recognize the good providence of Almighty God in supervising the interests of this nation from its establishment to the present time, we would not, in organizing our party for the legal prohibition of the liquor traffic, forget that our reliance for ultimate success must be upon the same omnipotent arm.

"6. That a Central Executive Committee of one from each State and Territory and the District of Columbia be appointed by the Chair, whose duty it shall be to take such action as, in their judgment, will best promote the interests of the party."

At the fall elections of 1869 Ohio was the only State returning votes for the Prohibition party as a distinct organization, 679 being reported from that State. But Maine and Minnesota each cast votes for "Republican-Prohibition" candidates—the former 4743 and the latter 1061.

In 1870 support was received at the polls in six States, as follows: Illinois, 3712; Massachusetts (Lieutenant-Governor), 8692; Michigan, 2170; New Hampshire, 1167; New York, 1459; Ohio, 2812—total, 20,012. In Massachusetts the Prohibition candidate for Governor this year was Wendell Phillips, and, being indorsed by the Labor party and Independent Republicans, he polled 21,946 votes—many more than were cast for the other candidates of the Prohibitionists.

Only a few of the States held elections in 1871. Five returned Prohibition votes: Massachusetts, 6598; New Hampshire, 314; New York, 1820; Ohio, 4084, and Pennsylvania, 3186—total, 16,002. In New York the party took the name of "Anti-Dram-shop." In Pennsylvania it appeared for the first time.

The first National Nominating Convention was held on Washington's Birthday (February 22), in 1872, at Columbus, O. James Black of Pennsylvania, and John Russell of Michigan, were unanimously nominated for President and Vice-President, respectively. Besides the planks on temperance there were planks favoring a sound currency, convertible into gold or silver, suffrage irrespective of color or sex, low rates of travel and transportation, direct vote for Presidency and Vice-Presidency, promotion of immigration, transportation, and purity of office. For the result of Presidential elections, see the end of this article.

Throughout these early years of independent political agitation, and for nearly 10 years more, there was practically no general

**First
Presidential
Nomination.**

acceptance of the claims of the National Prohibition Party. Operations were confined to separate States, and the results gained, while promising in a number of cases, were temporary and were not followed up. The election returns frequently describe the Prohibition votes of this period as "Temperance" or "Anti-Dram-shop." In Rhode Island the Prohibition question changed the face of politics for several years. A legislature and a Governor friendly to Prohibition were chosen in 1874, and a prohibitory law was accordingly enacted. A conspiracy to annul it was immediately instituted, and the parties were split into factions for and against repeal. In 1875, on the question of repeal, three candidates for Governor were nominated, and the candidate committed to the retention of the measure (Howard, Republican and Prohibitionist) received a plurality, but the liquor men carried the legislature and seated an anti-Prohibition Governor. The political complications growing out of the developments of 1875 continued until 1880, and in each year the Prohibition element polled a heavy vote, ranging above 6000.

The second National Nominating Convention met in Cleveland on the 17th of May, 1876. Green Clay Smith of Kentucky was nominated for President, and Gideon T. Stewart of Ohio, for Vice-President. "The National Prohibition Reform Party" was substituted for the old name.

Without resources or encouragement, the party conducted no canvass in 1876. This was the exciting Tilden-Hayes year, and electors were especially unwilling to break away from their old parties. But the Prohibition vote, the light, was distributed over 18 States; twice as many States as had furnished support in any former year.

The intention of continuing the national struggle was shown in 1877, when a national conference of the party was held in New York City (September 26 and 27).

The elections of 1877 were signalized by votes of 10,545 in Iowa (a State that had ignored the movement), and 16,354 in Massachusetts. Iowa's action proved to be of far-reaching importance; the bold step taken by her Prohibitionists alarmed the Republican leaders and prepared the way for the Constitutional Amendment agitation and the subsequent submission and legislation.

The third National Nominating Convention met at Cleveland, June 17, 1880. Neal Dow of Maine was nominated for President, and Rev. H. A. Thompson of Ohio, for Vice-President.

Sixteen States gave votes in 1880 as against 18 in 1876. Again the party was too feeble to make a formal campaign. Votes for State candidates in 1880: Connecticut, 488; Massachusetts, 1059; Michigan, 1114; New Jersey, 195; Ohio, 2815; Pennsylvania, 1898—total, 7489.

The years 1881 and 1882 mark a new epoch in the history of the National organization. At the Lake Bluff convocation (held near Chicago) in August, 1881, some of the influential

Prohibition leaders who had not been very actively identified with the party, or had held aloof from it, decided to secure, if possible, a more vigorous championship, and a stronger support for it. George W. Bain of Kentucky, A. J. Jenkins of Illinois, Miss Frances E. Willard of Illinois, and R. W. Nelson of Illinois, were appointed a committee to organize a so-called "Home Protection Party" as "a political party whose platform is based on constitutional and statutory Prohibition of the manufacture and sale of alcoholic beverages in the State and nation." A call for a National convention, joined in by the others interested, was issued, and the body met in Farwell Hall, Chicago, August 23 and 24, 1882; 341 delegates being present from 22 States. A new name, the "Prohibition Home Protection Party," was adopted.

"Home Protection Party."

There was substantial growth at the State elections of 1881, 1882, and 1883; the more encouraging because it was the consequence of steadily rising sentiment.

The Nominating Convention of 1884 was called to meet at Pittsburg, May 21. But it was desired by some of the new leaders, and by many who had not fully made up their minds, to make a final test of the tendencies of the other political parties before entering the field. The date was changed to July 23, and prominent representatives of the movement were sent to the Republican National Convention 1884 to 1888. (at Chicago, June 5), and the Democratic National Convention (at Chicago, July 10) to appeal to those bodies to favorably recognize the temperance question as one of the political issues of the day. The platform committees of the two conventions, after listening with scant courtesy to the advocates, ignored their requests. Many who had hoped that the Republican or the Democratic party would take up the cause in due time, were now convinced of the hostility of both these organizations, and when the Prohibition convention assembled at Pittsburg, on the 23d of July, it was evident that a profound impression had been made on the country. Thirty-one States and Territories (including the District of Columbia) sent 465 accredited delegates. The name of the party was once more changed, the original name of "Prohibition Party" being restored. John B. Finch of Nebraska was placed at the head of the National committee. The temperance women were given special representation in the committee, by the selection of Miss Frances E. Willard of Illinois, and Mrs. Stewart of Ohio, as members-at-large.

Woman suffrage, however, was left to the discretion of the States, and the platform devoted almost purely to Prohibition and the results of intemperance on the nation at large.

With the Presidential campaign of 1884, the National Prohibition party ceased to be a merely nominal organization, and began its active career. A headquarters was opened at Chicago, and an energetic canvass was made. Mr. St. John and numerous other able speakers addressed large audiences in many States.

The party was strengthened by cooperation from certain elements of voters who conscientiously opposed both Mr. Cleveland and Mr. Blaine, on grounds of personality, and who, recognizing in Mr. St. John a pure man, and in his cause a movement of good aspirations, sustained the Prohibition ticket because (from their points of view) no other acceptable one was presented.

This campaign brought fresh vigor to the Prohibition press. The first number of *The Voice* was issued September 25, 1884. After the November election it was suspended until the 1st of January, 1885, and since that date its publication has been continued without interruption, under the general

Journals. supervision of I. K. Funk, D. D., and, for the most of the time, the directing editorship of Mr. E. J. Wheeler. Among the other journals which have advocated the principles of the party are, *The Lever* of Chicago, *The New Era* of Springfield, O., *The Witness* of New York City, *The Constitution* of New York City, *The Indiana Phalanx*, Indianapolis, Ind.

Thirty-four of the 38 States yielded votes in 1884. There was a marked advance throughout the principal States of the North. New York decided the Presidential election in favor of Cleveland, but by a very small plurality (1040); and, assuming that the accessions to the Prohibition party came chiefly from the Republicans, it is evident that the result in the country at large would have been reversed if no Prohibition ticket had been run. As a result, the attacks upon the Prohibition party by Republicans at this time were very bitter. They aided the party, however.

After the election of 1884, it was a common remark among the advocates of the Prohibition party that they had "elected their issue" to a conspicuous place in national politics. Their hope was that it would soon be made the dividing issue, and that a reconstruction of parties would be accomplished. Many believed that the expected result would come to pass at the Presidential contest of 1888. But the rising interest in the tariff discussion interfered with their plans.

The party held its national convention at Indianapolis on the 30th and 31st of May. Forty-two States and Territories, and the District of Columbia, sent delegates. The nominations for President and Vice-President were given, respectively, to General Clinton B. Fisk of New Jersey, and John A. Brooks of Missouri.

After a protracted struggle a woman's suffrage plank was put back into the platform; planks were also introduced on arbitration, restriction of immigration, civil service, uniform marriage and divorce laws, tariff for revenue only, defense of the Sabbath, etc.

Great energy and zeal characterized the Fisk and Brooks campaign. *The Voice* raised from its readers funds that enabled the publishers to send that paper to 60,000 clergymen of the country, and (for several weeks) to 500,000 farmers. Votes were polled in every State but South Carolina.

The convention of 1892 was held in Cincinnati, June 30. John P. St. John of Kansas was chosen temporary chairman, and Eli F. Ritter of Indiana permanent chairman. General John 1892 to 1896. Bidwell of California was nominated for President, and J. B. Cranfill of Texas for Vice-President. The platform declared for Prohibition, woman suffrage, currency reform, anti-monopoly laws, restriction of immigration. It contains, besides, the following planks :

All men should be protected by law in their right to one day of rest in seven.

Arbitration is the wisest and most economical and humane method of settling national differences.

Speculations in margins; the cornering of grain, money, and products; and the formation of pools, trusts, and combinations for the arbitrary advancement of prices should be suppressed.

We pledge that the Prohibition party, if elected to power, will ever grant just pensions to disabled veterans of the Union Army and Navy, their widows and orphans.

We stand unequivocally for the American public school and opposed to any appropriation of public moneys for sectarian schools. We declare that only by united support of such common schools, taught in the English language, can we hope to become and remain a homogeneous and harmonious people.

Samuel Dickie was continued chairman of the National committee, and William T. Wardwell of New York made secretary.

Since 1893 there have been a number of important Prohibition victories in the election of municipal governments, notably in Norfolk, Va.; Williamsport, Pa.; Albion, Mich., and Wellsville, O.; all of these four cities having elected Prohibition mayors and councils.

Of late years there has been a growing dissension in the party over the attitude to be taken in respect to issues other than Prohibition. One division, styled "broad-gage," has contended for declarations on all the important political issues, while the other division, called "narrow-gage," has sought to confine the party's declarations more and more closely to the single issue. This controversy has made itself felt with more or less intensity in a number of national conventions, but culminated in that of 1896 in a split and the formation by seceding "broad-gagers" of the National party. The convention at which this occurred met in Pittsburg May 27 and 28, 39 States and Territories being represented by 810 delegates. A. A. Stevens of Pennsylvania was temporary, and Oliver W. Stewart of Illinois, permanent chairman. The committee on resolutions brought in two reports, and the real conflict came on the currency plank. The majority report ("narrow-gage"), presented by I. K. Funk, was silent on the currency question, while the minority report ("broad-gage"), represented by John P. St. John, included the following :

"That all money be issued by the Government only, and without the intervention of any private citizen, corporation, or banking institution. It should be based upon the wealth, stability, and integrity of the nation, and be a full legal tender for all debts, public and private, and should be of sufficient volume to meet the demand of the legitimate business interests of the country. For the purpose of honestly liquidating all our outstanding coin obligations, we demand the free and unlimited coinage of silver and gold at a ratio of 16 to 1, without consulting any other nation."

This plank was voted down by a vote of 387 to 427. Robert H. Patton of Illinois then offered, as a substitute for all that was before the convention from the committee on resolutions, a declaration for Prohibition alone, and this was adopted as the platform. It was as follows:

"The Prohibition party, in national convention assembled, declares its firm conviction that the manufacture, exportation, importation, and sale of alcoholic beverages, has produced such social, commercial, industrial, and political wrongs, and is now so threatening the perpetuity of all our social and political institutions, that the suppression of the same by a national party organized therefor is the greatest object to be accomplished by the voters of our country, and is of such importance that it, of right, ought to control the political actions of all our patriotic citizens until such suppression is accomplished.

"The urgency of this course demands the union, without further delay, of all citizens who desire the prohibition of the liquor traffic; therefore, be it

"Resolved, That we favor the legal prohibition, by State and national legislation, of the manufacture, importation, and sale of alcoholic beverages. That we declare our purpose to organize and unite all the friends of Prohibition into one party, and in order to accomplish this end, we deem it of right to leave every Prohibitionist the freedom of his own convictions upon all other political questions, and trust our representatives to take such action upon other political questions as the changes occasioned by Prohibition and the welfare of the whole people shall demand."

(See PROHIBITION.)

PROLETARIAT.—Derived originally from the Latin *proletarii*, the name given in the census of Servius Tullius to those who were only of value to the state as the rearers of offspring (*proles*); in other words, they were of no importance either for wealth, or position, or exceptional ability; hence the term has been applied to the common people. Formerly used as a term of contempt—as being of the lowest and meanest order of men—the term in its French form has latterly been given a distinct meaning, and is used by writers and speakers on social questions, to denote those who, destitute of land or accumulated wealth, are entirely dependent upon selling their labor; the working people, as opposed to the bourgeoisie and the aristocracy. In the modern sense of the term, the proletariat is an outcome of the changed conditions of industry; it was not until the division of labor began, and one man became dependent on another for his living, that the condition was possible; and not until the latter part of the eighteenth century, after the great revolution caused in industry by the introduction of machinery and the factory system, was the separation of the great mass of working people from the land so complete as it is at present.

PROPERTY (from Latin *proprius*, own, peculiar) may be defined in its economic sense as "any object of value that a person may lawfully use, acquire, or hold" (*Standard Dictionary*). Says J. S. Mill, "Property denotes in every style of society the largest powers of exclusive use or exclusive control over things, and sometimes unfortunately over persons, which the law accords or which cus-

Joshua Levering of Maryland, and Hale Johnson of Illinois, were nominated for President and Vice-President. After the nominations, Mrs. Ella A. Boole of New York attempted to add a woman suffrage plank to the platform, but, objection being made, she offered it as a simple resolution, and in that form it was adopted by a large majority. The "broad-gage" element held a meeting on the night of May 30, and led by John P. St. John, R. S. Thompson, Helen M. Gougar, and L. B. Logan, formed the National Party, nominated Charles E. Bentley of Nebraska, and James H. Southgate of North Carolina, and adopted a platform containing, in addition to a Prohibition plank, one in favor of woman suffrage, the money plank discarded by the regular convention, and numerous others. The regular organization (National Prohibition Party) reelected Samuel Dickie chairman, and William T. Wardwell secretary of the national committee. The new organization (National Party) constituted L. B. Logan chairman and Dow J. Thomas secretary.

Revised by E. J. WHEELER.

tom in that state of society recognizes" (*Essays on Socialism*).

The Roman law defines property as follows: *Dominium est jus utendi et abutendi re sua, quatenus juris ratio patitur.* The *code civil français* says,

Definitions. "Property is the right of disposing and of enjoying things in the most absolute manner, provided that no use is made of these prohibited by laws and regulations."

All these definitions imply the idea that the right of holding property is dependent upon law and therefore not superior to law. This is, however, not the view of all publicists. Very various views have been and are held as to what is the basis of property.

1st. Roman jurists, and many modern ones, consider the occupancy of things without an owner as the principal title conferring property. "*Quod enim nullius est, id ratione naturali occupanti conceditur,*" says the *Digest*. Grotius argues that God after the creation conferred on

the human race a general right to everything, and then says: "This was done that each might take for his use whatever he wished, and consume what it was possible for him to use. . . . Matters remained thus until, from the increase in the number of men, as well as of animals, the land, which was formerly divided by nations, began to be divided among families, and since wells are a supreme necessity in dry countries, and are not equal to supplying a large number, each appropriated what he was able to seize." This, as far as man goes (whatever one thinks as to creation), is undoubtedly a generally accurate account of the actual way in which property originated; it simply exalts an historic fact into a natural law. But whether a just title to ownership can be gained in this way is another thing. Law undoubtedly has recognized such a title, but whether it should raise other questions. J. S. Mill (*Political Economy*, book ii. chap. ii.) defends a title to possession which has not been legally questioned within a moderate number of years, but says this is no argument for unjust present laws. He says:

"It is necessary to the security of rightful possessors, that they should not be molested by charges of wrongful acquisition, when by the lapse of time witnesses must have perished or been lost sight of, and the real character of the transaction can no longer be cleared up. Possession which has not been legally questioned within a moderate number of years ought to be, as by the laws of all nations it is, a complete title. Even when the acquisition was wrongful, the dispossession, after a generation has elapsed, of the probably *bona fide* possessors, by the revival of a claim which had been long dormant, would generally be a greater injustice, and almost always a greater private and public mischief, than leaving the original wrong without atonement. It may seem hard that a claim, originally just, should be defeated by mere lapse of time; but there is a time after which (even looking at the individual case, and without regard to the general effect on the security of possessors) the balance of hardship turns the other way. With the injustices of men, as with the convulsions and disasters of nature, the longer they remain unrepaired, the greater become the obstacles to repairing them, arising from the after-growths which would have to be torn up or broken through. In no human transactions, not even in the simplest and clearest, does it follow that a thing is fit to be done now, because it was fit to be done sixty

years ago. It is scarcely needful to remark that these reasons for not disturbing acts of injustice of old date cannot apply to unjust systems or institutions; since a bad law or usage is not one bad act in the remote past, but a perpetual repetition of bad acts as long as the law or usage lasts."

2d. Many make labor the basis of property. This is the theory usually adopted by those economists who, like Adam Smith and his followers, both socialists and individualists, attribute to labor the production of all wealth. This theory, however, is far older than Adam Smith. Locke (*Civil Government*, chap. iv.) states this theory in brief, substantially as follows: Every one has an exclusive right over his own person. The labor of his body is, therefore, likewise his property. His labor, withdrawing objects from the state of community, makes them his. This, however, must be limited by reason and equity. "If any one exceeds the bounds of moderation and takes more than he has need of, he undoubtedly takes what belongs to others." Locke's great principle is, "Every one ought to have as much property as is necessary for his support."

The majority of writers try to base the whole right of property upon labor. Says Mill (*Political Economy*, book ii. chap. ii.):

"The institution of property, when limited to its essential elements, consists in the recognition in each person of a right to the exclusive disposal of what he or she have produced by their own exertions, or received either by gift or by fair agreement, without force or fraud, from those who produced it. The foundation of the whole is the right of producers to what they themselves have produced. It may be objected, therefore, to the institution as it now exists, that it recognizes rights of property in individuals over things which they have not produced. For example, it may be said that the operatives in a manufactory create, by their labor and skill, the whole produce; yet, instead of its belonging to them, the law gives them only their stipulated hire, and transfers the produce to some one who has merely supplied the funds, without perhaps contributing anything to the work itself, even in the form of superintendence. The answer to this is that the labor of manufacture is only one of the conditions which must combine for the production of the commodity. The labor cannot be carried on without materials and machinery, nor without a stock of necessaries provided in advance, to maintain the laborers during production. All these things are the fruits of previous labor. If the laborers were possessed of them they would not need to divide the produce with any one; but while they have them not, an equivalent must be given to those who have, both for the antecedent labor and for the abstinence by which the produce of that labor, instead of being expended on indulgences, has been reserved for this use. The capital may not have been, and in most cases was not, created by the labor and abstinence of the present possessor; but it was created by the labor and abstinence of some former person, who may indeed have been wrongfully dispossessed of it, but who, in the present age of the world, much more probably transferred his claims to the present capitalist by gift or voluntary contract.

"The right of property includes, then, the freedom of acquiring by contract. The right of each to what he has produced implies a right to what has been produced by others, if obtained by their free consent; since the producers must either have given it from good will, or exchanged it for what they esteemed an equivalent, and to prevent them from doing so would be to infringe their right of property in the product of their own industry."

But this basis for property is open at least to confusion. Labor to-day, even in its simplest forms, is largely a social process. A man builds a house with his own hands, but, even if

Property
Based upon
Labor.

he has no architect, he is largely indebted to his fellows for his ideas of house-building; government protects him from molestation during the process; he gets the wood or stone in one place, the nails or mortar in another, the paint in another. He uses gas which a company furnishes, or oil that somebody else has supplied. A man writes a book, but all his ideas, with much of the language, may be gotten from his neighbor's conversation or from other books in his library. It is easy to say that labor has produced the work, but whose labor?

"Nine hundred and ninety-nine parts out of the thousand of every man's produce are the result of his social inheritance and environment." So says Edward Bellamy (*Contemporary Review*, July, 1890); and Mr. Kidd adds, "This is so; and it is, if possible, even more true of the work of our brain than of the work of our hands" (*Social Evolution*, p. 267). All attempt, therefore, to divide produce according to individual contribution to the result must be impossible; or, if it were possible to say exactly what is produced by a man's own labor, is it just that a man, favored perhaps by circumstances for which he has no credit, is given favorable opportunity to labor and so produces much, should have property, while another equally willing and competent to labor, but deprived of the opportunity, due to circumstances over which he has no responsibility, should be left to starve and possess nothing?

3. Property is based on a convention, whereby men agreed to abandon the primitive community. Some, like Kant, do not claim that this is a historic fact, but speak of it as a juristic necessity, or a fact the justice of which demands respect. It is, however, as Kant admits, impossible to show that there ever was such a compact, while, as for the juristic necessity, the view leads to one of the two following views, a basis in law or in utilitarianism.

4. Many writers of many shades of thought maintain that property is the creature of law. Says Bossuet (*Petit Traité de l'Écrit*, sec. 1, art. 3, 4, propos): "Banish governments, and the earth and all its fruits are as much the common property of all mankind as the air and light." Montesquieu says (*Esprit des Lois*, lib. xxvi. chap. 15): "As men have renounced their natural independence to live under political laws, they have also renounced the natural community of goods to live under civil laws. The former laws give them liberty, the latter property."

Bentham says (*Treatise on Legislation*): "Property and the law were born together and will perish together. Before law there was no property; banish law, and all property ceases." But if the law justifies property, what justifies the law? This view, therefore, simply leads to the next view.

5. Certain economists, such as Roscher, Mill, Courcelle-Seneuil, say that human nature is such as to require property, for without this there would be no stimulus to labor or saving. But many deny this fact. The soldier, the scholar, the artist, continually labor and save, not in the least from any stimulus of hope of

property. They labor for the love of honor, it may be, and they save in order to labor more effectually. Again, heroes and the humane continually labor for the good of others. The utilitarian view can by no means be universally proven, if one be content with utilitarianism.

6. Some regard property as a natural right. Fichte says, in his book on the French Revolution, "The transformation of materials by our own efforts is the true juridical basis of property and the only natural one. . . . Every man has over the material world a primordial right of appropriation, and a right of property over such things only as have been modified by him." In his *Grundlage des Naturrechts* Fichte says every man has an inalienable right to live by labor, and consequently to find the means of employment. Hegel says (*Rechtsphilosophie*, § 49): "Every one has a right to be possessed of property." M. H. Ahrens in his *Naturrecht* says:

"Law consists in the group of conditions necessary for the physical and spiritual development of man, so far as these conditions are dependent on human will. . . . For every man's property is a condition of his existence and development. It is based on the actual nature of man, and should therefore be regarded as an original, absolute right, which is not the result of any outward act, such as occupation, labor, or contract. The right springing directly from human nature, the title of being a man is sufficient to confer the right of property."

But who knows about natural rights? Most publicists to-day have given up the theory of natural rights (*q. v.*). Some may maintain that man has a natural right to property, others may assert the contrary. Who can decide between them?

Thus something can be said against every basis for property. Says Professor Cunningham (in an essay on *The Church's Duty in Relation to the Sacredness of Property*):

"There are so many conflicting opinions; and the opposing parties, in regard to any proposal where the rights of property are affected, seem to have no ground in common. There hardly seems to be any recognized principle which is generally accepted, and on which it is possible to take a stand. Even the best established maxims on which property rests seem to be turned into new weapons to attack it. The title to property by right of conquest earns no respect. Why should not the man who took things violently, be violently dispossessed? The title by prescription, long and undisturbed possession, seems to have little weight. If you have enjoyed a large estate for a long time, it may be retorted, isn't it fair that some one else should have a turn? So the ground seems to be cut away from the old legal principles, and we are set adrift into a troubled sea where conflicting interests struggle to assert themselves and changing tides of sentiment prevail. Discussions are so apt to resolve themselves into arguments from expediency. The optimist and the pessimist make different forecasts as to the probable effects of some measure, and there seems to be no means of deciding between them, or of convincing either of right and wrong apart from considerations of consequences. We never seem to get to a firm foundation of any sort at all."

Professor Cunningham proceeds to argue as to religious duty. Most economists to-day, however, discuss the question as to property, simply on the basis of utility. For this see COMMUNISM; SOCIALISM; and INDIVIDUALISM. Some, however, argue from this conflict of views as to the basis of property against all property, and, like Proudhon, call property theft. For Proudhon's view, see PROUDHON. For the impor-

tant and especial form of property,—property in land,—see LAND.

PROPORTIONAL REPRESENTATION.—John Stuart Mill wrote in his *Considerations on Representative Government* :

“The pure idea of democracy, according to its definition, is the government of the whole people, by the whole people, equally represented. Democracy, as commonly conceived and hitherto practised, is the government of the whole people by a mere majority of the people, exclusively represented. The former is synonymous with the equality of all citizens; the latter, strangely confounded with it, is a government of privilege, in favor of the numerical majority, who alone possess practically any voice in the State. This is the inevitable consequence of the manner in which the votes are now taken, to the complete disfranchisement of minorities.”

No one, who has not analyzed the statistics of political elections, can realize how defective is the electoral machinery of most countries. The late Mr. Thomas Hare, who was known in England as the “Father of Proportional Representation,” calculated that no less than two-fifths of the voters were wholly unrepresented in Parliament, while in this country Mr. Salem Dutcher, to whom we owe an excellent work on “Proportional Representation,” curiously enough found the same proportion of two-fifths to be true also for the fortieth, forty-first, and forty-second Congresses of the United States. In Switzerland the statistics for the years 1881, 1884, and 1887 of the elections to the National Council, which corresponds to our House of Representatives, reveal the same unjust state of affairs. As matters now stand in these countries, the powers of government are intrusted to a majority of the majority, who may be a minority of the whole electorate. If, for instance, three-fifths of the electors only are represented in a certain legislature, and one-half plus one of the representatives, or say two-thirds, in order to leave a little margin, regulate the character of legislation, then the majority in that legislature, which frames the laws, represents a minority of the electors; for $\frac{3}{5} \times \frac{1}{2} = \frac{3}{10}$ or $\frac{3}{10}$, which is less than one-half. Mr. Garfield, while still a Congressman, described this unjust feature of our political machinery with characteristic clearness in a speech delivered before the House of Representatives on the 23d of June, 1870. “In my judgment,” he said, “it is the weak point in the theory of representative government, as now organized and administered, that a large portion of the voting people are permanently disfranchised. . . . Take my own district as an example; I have never been elected by less than 9000 majority.

Sometimes the majority has exceeded 12,000. There are about 10,000 Democratic voters in my district, and they have been voting there for the last 40 years, without any more hope of having a representative on this floor than of having one in the Commons of Great Britain.”

Every reader can supply illustrations of sim-

ilar injustices, either from his own electoral district or from the wider field of national politics.

To be more explicit, take the election of Congressmen in the United States in 1892. There were in round numbers twelve million votes polled; of these, six and a half million secured representation, while five and a half million were unsuccessful.

What do these figures reveal?

1. That a vast minority, including almost one-half of the voters, were disfranchised in that election. Nay, we can go further, and say that these five and a half million were not only unrepresented, but actually misrepresented by their opponents elected from their districts.

2. That the injustice of “taxation without representation” flourishes as unchecked as it did before the American Revolution, since five and a half million continue to pay taxes, altho unrepresented.

3. That majority rule is not in force in the United States, for the Democratic majority elected to Congress represented only 25 per cent. of the whole electorate, and a bare majority in Congress only 21.4 per cent., so that a small minority were actually making laws to govern the whole.

How hopelessly faulty voting in electoral districts can become may be seen from the results of this same election in Iowa: 219,215 Republican votes sent 10 Republican Congressmen to Washington, whereas 201,923 Democratic votes sent only one Congressman.

Undoubtedly the habit of manipulating the boundaries of electoral districts for party purposes also tends to aggravate these discrepancies. This abuse is called by the Germans *wahlkreisgeometrie*, or the geometry of electoral districts. In the United States it has been nicknamed the *gerrymander* (*q. v.*).

But even if dishonest electoral districts were never created, there would still remain a high percentage of unrepresented voters. The truth is, the whole system of electing representatives, as now practised the world over, cannot be made to produce accurate results. It is evident that a radical reform is demanded—one which shall make the vote of every elector effective, by applying the principle of proportional representation.

The various systems proposed are all based upon what is known technically as the electoral quota.

Suppose an imaginary State to contain 1000 voters, with 10 representatives to elect. Now, if 1000 votes elect 10 representatives, then $\frac{1}{10}$ of 1000 ought to elect 1 representative. Thus, $\frac{1000}{10}$, or 100, will be the electoral quota. Every candidate who can muster 100 votes will be declared elected, and every party will be entitled to as many representatives as 100 is contained in its total vote.

Basis of Proportional Representation.

To illustrate by actual example:

In the Congressional election of Indiana for 1892 the total vote was 549,405. Of these the Republicans cast 253,640; the Democrats, 259,184; the Populists, 24,223; and the Prohibi-

Injustice of Present Methods.

tionists, 12,358. There were 13 representatives to elect. Now, if 549,405 votes elect 13 representatives, $\frac{1}{13}$ of 549,405 ought to elect 1 representative. Thus, $42,261\frac{5}{13}$, or, for the sake of simplicity, 42,262 will be the electoral quota. The 253,640 Republican votes, divided by this quota, give six full quotas and a remainder of 68 votes; the 259,184 Democratic votes, six full quotas and a remainder of 5612. As neither of the remaining parties has enough votes to fill a quota, the thirteenth representative is taken from the part having the largest unfilled quota, the Populist. This would have made the Indiana delegation 6 Republicans, 6 Democrats, and 1 Populist, instead of the 2 Republicans and 11 Democrats who were actually elected.

The presence of unused fractions and remainders shows that the system of the electoral quota, without further provisions, is not infallible. But it guarantees an approximate accuracy which cannot be attained under present conditions, as the above example of the election in Indiana conclusively proves.

A variety of systems have been based upon this principle of the electoral quota, differing from each other in minor points:

Various Systems.

1. Personal Representation allows voters to select any candidates they may choose, irrespective of party or locality.

2. The Cumulative vote allows each elector to distribute his vote as he chooses, or cumulate them all upon one candidate.

3. The Limited vote gives the elector a less number of votes than there are candidates to elect.

4. The so-called Hare System works in the following manner: The voters receive ballots containing a greater number of names than there are representatives to be elected; say 12 instead of 6. The voters mark 6 names of the 12 in the order of their preference. In counting, the electoral quota is first ascertained by dividing the total number of ballots cast by the number of candidates to be elected. The candidates who have received at least the electoral quota are declared elected. The ballots of the successful candidates over and above the electoral quota are transferred to the candidates marked as second choice. When the surplus votes of successful candidates are exhausted, the ballots of candidates having least votes are transferred in the same manner to candidates marked upon them as second choice. Whenever the candidate marked as second choice is already elected, the ballot is transferred to the candidate marked as third choice, and so on until the necessary six representatives are elected. If the number of representatives should still remain incomplete after this process, the candidate receiving the number of ballots nearest to the electoral quota is declared elected. This method is far simpler in practise than any description of it can be. Miss Catherine H. Spence of Adelaide, South Australia, in using the Hare system with audiences at lectures, found that, out of a total of 3824 votes cast in about 50 trials, only 144 votes were unused, because they were for candidates either already elected or impossible to elect.

5. The so-called Grove system re-

sembles the foregoing, except that the candidates are required to announce before election to whom their possible surplus votes must be transferred.

6. The Free List system is in use in Switzerland. It has been adopted successfully by four cantons—Ticino, Neuchâtel, Geneva, and Zug. It differs from the Hare system in giving greater scope to party organizations, and is, therefore, a less radical departure from prevailing electoral methods.

The American Proportional Representation League assembled in Chicago at the Congress on Government in August, 1883, decided to advocate both the Hare and the Free List systems for experiment. (But see below.) On that occasion a sample bill was drawn up for the election of members of the United States House of Representatives by the Free List system. As the laws regulating the practise of this system in Switzerland contain much matter which is foreign to the methods in vogue in the United States, this sample bill will serve as a clearer illustration of the principle:

Resolved: "That the members of the House of Representatives shall be voted for at large in their respective States.

"A ticket composed of any number of candidates may be nominated by any body of electors in any State which polled at the last preceding election 1 per cent. of the total vote for Congressmen, or by a petition of voters amounting to 1 per cent. of such total vote. These tickets shall be printed on the official ballot.

"Each elector has as many votes as there are Representatives to be elected, which he may distribute as he pleases among the candidates, giving not more than one vote to any one candidate. Should he not use the entire number of votes to which he is entitled, his unexpressed votes are to be counted for the ticket which he shall designate by title.

"The votes given to candidates shall count individually for the candidates as well as for the tickets to which the candidates belong.

"The sum of all the votes cast in any State shall be divided by the number of seats to which such State is entitled, and the quotient to the nearest unit shall be known as the quota of representation.

"The sums of all the votes cast for the tickets of each party or political group nominating candidates shall be severally divided by the quota of representation, and the units of the quotients thus obtained will show the number of representatives to which each body is entitled; and if the sum of such quotients be less than the number of seats to be filled, the body of electors having the largest remainder—after division of the sums of the votes cast by the quota of representation, as herein specified—shall be entitled to the first vacancy, and so on until all the vacancies are filled.

"The candidates of each body of electors nominating candidates, and found entitled to representation under the foregoing rules, shall receive certificates of election in the order of votes received, the candidate receiving the highest number of votes the first certificate, and so on; but in case of a tie, with but one vacancy to be filled, the matter shall be determined by lot between the candidates so tied.

"If a member of the House of Representatives shall die or resign, or his seat become vacant for any reason, the remainder of his term shall be served by the candidate having the next highest vote of the body of electors to which such member belongs."

Enough has been said to show that the problem of proportional representation is by no means simple. The underlying principle that a legislature should reflect every phase of public opinion is undoubtedly just; the necessity for an electoral quota is self-evident—but the practical application of this reform requires careful methods. Absolute accuracy cannot probably be attained under any

system, but surely nothing could be worse than the rough-and-ready electoral machinery now in general use.

Some of the systems quoted above have been tried at various times in various countries, but on the whole the working of the Free List in Switzerland

Practical Working.

has, so far, proved the most successful in politics. For instance: before the adoption of proportional representation in the Canton of Ticino, the elections of 1889 to the Grand Council resulted as follows: There were 112 deputies to elect; of these, the Conservatives, with 12,653 ballots, returned 77, while the Liberals, with 12,008 ballots, *i. e.*, with only a few hundred less than their opponents, only 35. After the adoption of the Free List the two parties returned an almost equal number of deputies. Entirely satisfactory results have been obtained also in the other cantons, and the reform is, therefore, spreading to all parts of the Swiss Republic. No relief can come from merely rearranging electoral districts. Every redistricting bill must be a mere makeshift, for the time always comes when the work has to be done over again. How much better, then, to seek a permanent solution of the difficulty in some plan of proportional representation! Such a system is at once stable, because pivoted upon a great principle; and elastic, because, from its very nature, it expands with the growth of the State.

In that day, when minorities have their own spokesmen in our legislative halls, great reforms will no longer be ignominiously swept aside as rubbish by the so-called practical politicians. Every school of reformers, if they can muster a sufficient following, will have a chance to demonstrate the value of its ideas. Someone has said that the present representative system may be likened to that of protection of trade, in that it artificially protects majorities against the competition of minorities. In fact, the dead level of mediocrity which characterizes our legislatures would be effectually broken. Their whole tone would be raised by the introduction of new reforms at the hands of chosen champions; principles, not personalities, would become the chief issues; and men of talent, experts in certain branches of science, which are indispensable to the conduct of good government, would then willingly take up politics as a profession, instead of, as now, shrinking from serving their country, because it has become an occupation of evil repute. Proportional representation will, of course, like every great act of justice, be scouted as a wild theory. The wire-pullers of the party or parties, who may happen to be in power, will oppose its introduction with all the means at their disposal, for it would prevent them from perpetuating their rule by gerrymandering; but eventually it must be adopted, if the representative system itself is to stand. Let not John Stuart Mill's word of warning be forgotten: "It is an essential part of democracy that minorities should be adequately represented. No real democracy, nothing but a

false show of democracy, is possible without it." . . . W. D. McCrackan.

The following recent information is abridged from Professor John R. Commons' *Proportional Representation*. Copyright by Thomas Y. Crowell, Boston and New York. He says (pp. 237-264):

"In the third and fourth decades of the present century a remarkable wave of democracy culminated in our Western civilization. . . .

"The years 1844 in America and 1846 in Switzerland mark the first attempts of individual minds to inquire into the real basis of true representation. Mr. Thomas Gilpin published at Philadelphia, in the former year, his prophetic work, of which little notice was then taken, *On the Representation of Minorities of Electors to act with the Majority in Elected Assemblies*. In 1846 Victor Considérant, the distinguished leader of the socialist school of Fourier, addressed an open letter to the Grand Council of Geneva, entitled, *De la Sincérité du Gouvernement Représentatif, ou Exposition de l'Élection Véridique*. In this brochure M. Considérant proposed independently a plan of election almost identical with that of Thomas Gilpin. Each voter was to cast one vote for a party, and then to indicate the names of the candidates of his party whom he preferred. The proportion of representatives to which each party should be entitled was to be determined by the rule of three, and the successful candidates by the order of their preferences. Something akin to this plan had been suggested some twelve years before by Considérant's master, Charles Fourier; and its publication in 1846 preceded by one year the wide extension of the suffrage in Geneva. There was as yet no feeling of serious need for it, and it therefore lay dormant 15 years. . . .

History.

"In September, 1861, Professor Ernest Naville published his first brochure addressed to the Federal Council and the Swiss people, showing that the violence of the elections, which threatened the stability of Swiss institutions and inspired throughout Europe a dread of the new democracy of 1848, was but the natural outcome of the general ticket and exclusive majority rule. Professor Naville from that date has been the recognized leader of the reform in Switzerland; and his numerous publications, besides presenting cogent arguments, afford a complete history of proportional representation to the present time.

"In 1867 was formed l'Association Réformiste de Genève, composed of Professor Naville and six associates. But the time was not yet ripe. . . . The movement for the referendum and initiative as a decidedly practical and thoroughgoing deadlock upon their unrepresentative assemblies absorbed the thought of the people. . . . In the year 1876 the national Association Suisse pour la Représentation Proportionnelle was organized, with branches at Berne and Geneva. Hearings were obtained from time to time before legislative and constitutional assemblies. But it required a crisis to force public attention upon the reform.

"The crisis came in 1890 in the Italian canton of Ticino. The Conservative party in 1889, with 12,653 votes, elected 77 of the 112 members of the Grand Council while the Liberals, with 12,008 (a handful less), elected only 35. Out of a total vote of 24,671, it was calculated that 9157 were unrepresented. Finally, in 1890, an insurrection broke out. The Liberals seized upon the arsenal, and overthrew the Conservative Government. Federal troops were dispatched to put down the revolt. Then it was that the Federal Government recommended to the canton the adoption of proportional representation. The suggestion was acted upon, a commission was created, and in 1891 the Free List was adopted in the form approved by the Swiss Association.

"From Ticino the reform has spread rapidly to other cantons. The initiative and referendum have helped it very much. The French Protestant canton Neuchâtel adopted it in 1891; the large canton of Geneva in 1892; the Catholic Fribourg, for municipal elections, in 1894; the German Catholic Zug in 1894, which combined the 'free ticket' with cumulative voting; finally the German Catholic Solothurn in March, 1895, the first to introduce the Droop quota (the votes divided by the number of representatives increased by one). In a few cantons and cities the reform has been rejected by referendum. The city of Basle rejected it a few years ago, but the people are now demanding it anew

by initiation. . . . England and America, however, have actually preceded Switzerland by 20 to 25 years in the adoption of certain forms of minority representation. . . .

"In 1851, in the discussion of the second Reform Bill, Lord John Russell moved in Parliament, on the suggestion of Professor Fawcett, that in the newly created electoral districts returning three members no elector should vote for more than two candidates. . . .

"In 1854 Mr. James Garth Marshall published at London his *Majorities and Minorities: Their Relative Rights*, wherein he proposed for the first time the cumulative vote which has been so popular in English and American reforms. The limited vote of Lord Russell, however, did not find legislative enactment until 23 years after its first proposal; and the cumulative vote was first employed in 1870.

England.

Two events prepared the way for this adoption. The first was the discussion inaugurated by Mr. Thomas Hare in 1859, when he published his volume entitled *The Election of Representatives, Parliamentary and Municipal*, which was followed in 1862 by John Stuart Mill's profoundly philosophical *Considerations on Representative Government*. Mr. Mill speaks of Thomas Hare as 'a man of great capacity, fitted alike for large general views and for the contrivance of practical details'; and of his plan as 'among the very greatest improvements yet made in the theory and practise of government.'

"Certainly no discussions have equaled these treatises of Mill and Hare in placing before the thinking people of all countries the true nature of representation under universal suffrage and political parties. . . .

"In 1870, when the English Government began its wide extension of free schools, the cumulative vote was introduced in the election of the new local boards of education. This was by way of concession to the supporters of private and sectarian schools, who wished to retain their hold in the distribution of public funds, and in the administration of their schools.

"With this Act the progress of proportional representation in England ceased. When the suffrage was extended in 1884 to agricultural laborers, an attempt was again made to introduce the reform, but after considerable discussion the amendment was defeated. The next year was organized the English Proportional Representation Society, of which Sir John Lubbock is president, and several of the members of Parliament are members. The society advocates the Hare system in constituencies electing five to fifteen representatives.

"In the United States the work of Thomas Gilpin followed close upon the Act of Congress of 1842, which for the first time took the control of elections for Congressmen from the several States, and provided, among other things, that the single-membered district should be universal. This was an attempt to give representation in Congress to the minority, who were practically disfranchised by the laws of certain States wherein Congressmen were elected on a general ticket. Gilpin's essay grew out of the discussion upon this measure.

"Not until the period following the Civil War was public opinion ready to discuss the principles of representation, nor, indeed, was there any pressing occasion. The writings of Mr. Hare and Mr. Mill were widely read in the United States; and the pending reconstruction of the States lately in rebellion, and the agitation for the enfranchisement of the freedmen, brought the problems of representation suddenly to a focus. There were only two plans which reached practical adoption—the limited vote and the cumulative vote. . . . The most important action was that taken by the constitutional convention of the State of Illinois, which met December, 1859. The convention adopted the report of a committee of which Mr. James Medill was chairman, dividing the State into 51 senatorial districts, each electing a single senator, but creating a lower house of 153 members, to be elected in the senatorial districts by threes by the cumulative vote. This section was voted upon separately by

United States.

the people, July 2, 1870, and carried by a vote of 99,022 in favor, and 70,080 against.

"The action of the New York Legislature and the veto by Governor Hoffman in April, 1872, of the bill providing for the cumulative vote in the election of aldermen in New York City, mark the highest point attained in America in the discussion of minority representation. . . .

"The arguments of Governor Hoffman against mi-

nority representation in the Board of Aldermen are not altogether invalid, and his objections to a similar representation in the administrative departments are well considered. Later experience has shown that administrative boards are incompetent as compared with single heads of departments, and that bi-partizan boards are not superior to those composed of members of a single party. Minority representation in an executive department dissipates the energy and responsibility of administration; but minority representation in the legislative branch is necessary to enable the minority "to watch the governing body; to expose its wrong-doing, if any; to restrain it by this vigilance and exposure." Professor Commons here describes other similar movements, and then says: "These various experiments with crude forms of minority representation furnish in part an explanation of the entire subsidence of the movement since 1874. . . .

"A revival of interest in proportional representation has begun within the past five years. The civil service reformers of the country, with unanimity, have espoused it. This interest took definite shape in 1893, through the organization at Chicago of the American Proportional Representation League, and the launching of the *Proportional Representation Review*. Magazine articles have appeared, two or three books have been published, bills have been introduced into legislatures and Congress, and an enthusiastic and capable agitation has been inaugurated.

"In 1891 the people of South Dakota voted upon a minority representation clause to their constitution, copied after the Illinois system, which they rejected by a vote of 46,200 against 24,161.

"The cumulative vote has been applied by the constitutions of the 11 States of Illinois, Nebraska, California, Pennsylvania, West Virginia, Missouri, Mississippi, Idaho, Kentucky, North Dakota, and Montana, to the election of directors of private corporations."

Of the various systems of proportional representation Professor Commons says:

"The single transferable vote has become the classical form of proportional representation, from the great ability with which it was presented by its author, Mr. Thomas Hare, and advocated by John Stuart Mill. It was also devised independently by the Danish statesman, M. Andrae, and introduced by him into the election of a portion of the members of the 'Rigsraad' in 1855, and for the 'Landsting' in 1867. It is advocated by the English Proportional Representation Society, of which Sir John Lubbock is president.

"There is a practical difficulty, almost insurmountable, in the application of this system to large constituencies, in the fact that all the votes of the entire constituency must be brought together to the central bureau for counting. They cannot be counted by the various precinct officials, leaving only the totals to be handled by the central board. The Hare system doubtless works well in a constituency of a thousand voters, as in the Mechanics' Institute of San Francisco, where it has been successfully employed in three elections, or in constituencies electing only three to seven candidates by a restricted suffrage, as in the Danish law of M. Andrae; but when ten thousand, or a hundred thousand, or a half million votes are to be counted, and a large number of the ballots must be recounted to make the proper transfers, the task is too heavy.

"The Hare system is advocated by those who, in a too doctrinaire fashion, wish to abolish political parties. They apparently do not realize the impossibility of acting in politics without large groupings of individuals; nor do they perceive that the Hare system itself, tho apparently a system of *personal* representation, would, nevertheless, result in *party* representation. And this from the fact that voters who act rationally, and wish to see their own views most strongly represented in legislation, would always transfer their secondary choices to candidates of the same party as the ones who receive their first choices. The only way in which the system could lessen party cohesion would be to require the names of candidates to be printed in alphabetical order, as in the present Massachusetts and California ballot laws, and not by party tickets, so that the voters would be compelled to search through the entire ballot for the candidates of their own party. This would doubtless encourage independent voting, but would by no means abolish parties. . . .

Hare System.

"With the present organization of parties in the

United States, and with the customary method of printing party tickets on the so-called Australian ballot, there is reason to believe that the Hare system would be forced into the service of parties.

"In 1870 M. Borély of Nîmes, France, proposed that each elector should himself indicate his preferences by numbering the candidates 1, 2, 3, etc. In this form the plan was adopted in 1871 by the Association Réformatrice of Geneva, Switzerland, and became known as the *liste libre*, or 'free ticket.' . . .

"This combination of the cumulative vote and the 'free ticket' answers in most respects the ideal of electoral reform. It gives to the voter the widest freedom of choice between all the individual candidates on all the tickets, avoids the waste and the consequent 'machine' supremacy of the simple cumulative vote, and opens the way for independent movements within and without the dominant parties. There are, however, two minor objections. If voters are allowed to write on their ballots the figures 1, 2, 3, etc., against individual candidates, it becomes easy to make those 'distinguishing marks' which the laws against bribery seek to prohibit. This objection would not hold against a plan by which the voter gives but one vote to a candidate or one to a ticket. Again, the cumulation involves a waste of votes between the groups or factions within the party corresponding to the waste which the simple cumulation permits between parties. Voters of a given faction who cumulate on their own first choices of their party candidates, and who fail to distribute their votes so as to aid the secondary candidates of the same faction, would be at a disadvantage, and minor but shrewder factions would secure disproportionate influence in the party representation. The cumulative vote with the 'free ticket' amendment has been adopted by the Canton Zug in Switzerland, and is favored by Professor Ernest Naville, the leading advocate of proportional representation in that country. It is simpler than the plan finally agreed upon by the Swiss and American advocates of the reform, and would, perhaps, secure all the advantages of the latter."

Swiss System.

PROSTITUTION is not an evil peculiar to any age, country, or civilization. Herodotus tells us of an extent and infamy of prostitution in ancient Babylon almost beyond belief. Prostitution in terrible and unnatural forms was a part of the religious cultus of goddesses or gods worshiped under different names in Phœnicia, Syria, Phrygia, Egypt, and the adjacent countries. Similar rites entered into the idolatry which repeatedly led the children of Israel astray, and are connected with the "groves" and "pillars," and other terms under which the English Old Testament covers the literal meaning of the Hebrew original. In Greece and at Athens, as well as in Corinth, we find the same sexual worship and prostitution made a matter of civic glory and religious gain. Unnatural vice we find openly practised and defended by Greece's sages, heroes, and statesmen. Prostitution was taught as an art. The most

educated women of Greece were courtesans. In Rome, if vice was made less beautiful, it was more unbridled. Women of the highest rank, even of the imperial purple, enrolled themselves as common prostitutes. Orgies took place in the baths and in the temples. Obscenity ruled the stage.

We find the evil in every portion of the globe; in India, in Japan, in Hawaii, and everywhere about in proportion to our knowledge of the life of the age and country. We find it in the Middle Ages alike in hovel and in palace; in cloister and in hall. If under the Puritan régime it was temporarily restrained, it broke out in the Restoration in a wilder carnival of vice. (See CRIME.) It exists to-day in modern Babylons as in the old; if it is now publicly condemned and the number of the pure is enormously increased, there are those who believe that it is eating to-day under the surface far more than is generally known. At the National Purity Congress in Baltimore (October, 1895), it was stated that the number of prostitutes in the United States was 230,000, and that this implied at least 1,150,000 prostitutes, which is probably far under the truth. Prostitutes are mainly found in the cities. Their male companions live not only in the cities, but also in the towns and villages, whose residents go to the cities for business, or pleasure, or both.

When Dr. Sanger wrote of prostitution in 1858, the number of women living as prostitutes in the city of New York, from information given by the then chief of police, and obtained from other reliable sources, was estimated to be 6000. In a paper prepared for the World's Congress on Social Purity, held in Chicago in June, 1893, Hon. Elbridge T. Gerry states that Superintendent Byrnes, of the police department, and himself compared notes with exactly the same result, and, viewing the matter from two different standpoints, they were agreed that the present number of prostitutes in New York city is at least 40,000.

Some think this estimate too high. The Rev. F. M. Goodchild, writing in *The Arena* for March, 1896, says:

"It has been declared that in New York city there are between 40,000 and 50,000 such women. That would make one habitual prostitute for every nine mature men in the city. As it is estimated that every fallen woman means on an average five fallen men to support her, it would appear that more than half our men are regular contributors to the brothel, which I should hesitate very much to believe. Eight years ago the superintendent of the Florence Night Mission estimated that there were then 15,000 prostitutes in New York city. The number has not increased by more than 10,000 certainly, probably not by more than 5000. An army of 20,000 such hapless creatures is ghastly enough not to need exaggeration."

Mr. Goodchild, however, appears to forget that prostitutes in New York city are not supported by residents of that city alone, so that there may be 40,000. Nor is there any reason for believing that New York is much, if any, worse than other places in proportion to their size.

A volume entitled *Chicago's Dark Places*,

which is the result of careful investigations, made by a corps of specially appointed commissioners, men and women of large experience in mission work among the degraded and criminal classes of the city, says :

"There are several sections in Chicago almost entirely devoted for whole blocks to houses of prostitution. One of these localities is known as the Black Hole, and it does not belie its name." The details given of the ways in which young girls are victimized and enslaved in these vile places, and of the hard pressure brought to bear upon dependent working girls, making them an easy prey to the seducer, are harrowing in the extreme. But this shameless vice is not confined to the slums. One section of the south side is mentioned in which sundry localities are devoted entirely to houses of prostitution. The major portion of these houses, says the commissioner, "are 'gilded palaces.' They are elegantly decorated and elaborately furnished, and to these the visitors generally come in carriages"; 14 carriages having been counted by the commissioner at one time on a single block. The reports upon the lower type of theaters, concert halls, and museums, are remarkable chapters, showing a close and direct connection between these so-called 'amusements,' strong drink, and social vice. In one of them in exterior a cheap theater, the commissioners, in a circuitous way, were introduced to girls 'in *accolite* costume,' who invited them 'down stairs' to 'see the can-can danced by 12 naked young ladies.' The exhibition consisted of 'a most disgusting dance, performed by over a dozen girls in a state of absolute nudity,' and ended, when the dance was over, with open and personal solicitations from these abandoned women.' In this vile place, where was also a 'bar, which did a thriving business,' they found on their arrival 'some 10 or 12 men, most of them respectable looking, some of them young and some old, all in eager expectancy awaiting the arrival of the 'ladies.'

"The reports on the 'immoral dives' and 'obscene pictures, books, and advertisements,' are striking exhibits of the numerous and ingenious ways in which the young of both sexes are systematically corrupted, and vice promoted."

Of Philadelphia Mr. Goodchild writes (see above) :

"There are not less than 1000 houses of ill fame in the city, and as many as 5000 women live among us by the sale of their bodies. I wish I might have confidence that the estimate is too high; but nearly six years of observation make me fear that the figures are much too low. This does not include, of course, the vast multitude of poor girls whose labor yields scarcely enough to keep body and soul together, many of whom fall victims to the lecherous men who are always on the watch for 'new cases.'"

But the older cities of Europe are probably even worse. General Booth of the Salvation Army in his *Darkest England* chart estimates the number of prostitutes in London at 30,000. They have been estimated at from 60,000 to 80,000. On certain squares and streets at midnight they literally crowd and block the sidewalks for square after square.

In Berlin a commission appointed by the Society of Medicine, with Professor Virchow as president, found 4364 prostitutes in that city recognized by the police, and estimated the total number at from 40,000 to 50,000.

Europe. (*Addresses of National Purity Congress*, Baltimore, pp. 250-252). The prefect of police of Paris is quoted as saying that there were in Paris over 100,000. (*Addresses*, as above, p. 310.)

Of the evils connected with prostitution there is scarcely need to speak. Many careful students are coming to believe that the sexual

evil, in its various forms, is greater even than that of intemperance. Says Professor A. G. Warner (*American Charities*, p. 66), "Careful observers believe it to be a more constant and fundamental cause of degeneration than intemperance. It certainly effects degeneration of a more or less pronounced type in a much larger number of persons. It persists almost to the end in the most degenerate stock, while at the same time it is operative among the healthier classes. . . ." Intemperance is, however, all but universally the companion of prostitution. It has been frequently said that girls rarely can, and men rarely do, continue a fast life without drink. If the saloon is often literally the entrance to a brothel, the brothel as frequently leads to the saloon. An eminent lawyer is quoted, on p. 121 of the published *Addresses of the National Purity Congress at Baltimore (1895)*, as saying: "It is my deliberate conviction, based upon facts coming to my knowledge in the course of 20 years' practise, that more boys are converted to drinking habits in houses of ill fame than in the saloons."

Of the physical evils attendant upon prostitution, perhaps more than enough has been said. Yet an evil that at any time may, and repeatedly does, reduce youth to premature, helpless, old age; transform the body into a rotten shell; affect not only the sinner, but his posterity; make the kiss of love the means of carrying contagion and foul disease to pure brides and innocent children, it is difficult to describe too strongly. Yet the extent of the evil may be seen by the following quotations from a paper read by Dr. A. F. Currier before the Section on Public Health and Legal Medicine of the New York Academy of Medicine, and published in the *Philanthropist* for May, 1891.

"In the class for diseases of women at the Outdoor Poor Department of Bellevue Hospital, 1802 new cases were received from February 1, 1890, to January 1, 1891. In this number there were 63 cases of syphilis and 191 of other forms of venereal disease. In the class for diseases of the skin and venereal disease there were at least as many more cases. Approximately there were 260 cases of venereal disease among 260 women. There are more than 30 dispensaries in New York in which such diseases are treated, and the average number of cases of venereal disease for each would not fall far short of 250 cases. Thus there are probably 6000 to 7000 cases of this kind which are annually receiving dispensary treatment. Probably as many more cases are treated in hospitals, in private practise, or receive no medical attention. A very large number of these cases include prostitutes with diseases which are in a contagious condition. It would hardly be unreasonable to say that there are 10,000 women in New York City who are in a condition to propagate actively venereal diseases. There are probably as many more men who are in the same condition. This grand army of disease producers represents a portion of the baneful results of prostitution in our midst, with no laws to restrict or regulate the evil. In countless cases sexual intercourse is indulged in by those who are aware of the infectious character of their disease. In many other individuals there is ignorance that they are the subjects of infectious disease."

One of the most atrocious evils connected with prostitution are the abominations of child prostitution. Says the Hon. E. T. Gerry (*Ad-*

dresses, as above, p. 340): "Few have the remotest idea of the extent to which sexual vice exists among children at the present time. I use the word

Child Prostitution.

'sexual vice' as including both self-abuse and prostitution. . . . Nothing but the vigilance of parents and guardians can detect the solitary vice, and hence statistics are very difficult to obtain, excepting when the one vice leads up to the other. But in the other case, the figures show a frightful prevalence, at the present time, of juvenile prostitution. True, under the stringent laws which have been enacted in the various States of our Union, at the instance of Societies for the Prevention of Cruelty to Children, those who utilize little children for the simple gratification of lust are made to suffer a felon's imprisonment, and while the effect has been to practically denude the brothels of youthful victims, still the vice exists, more especially among the lower classes, to a degree hardly credible in this civilized country. A large number of the brothels, at the present time, are replenished by juvenile prostitutes, rather than by those who have fallen but once. . . . That the disease is spreading is unquestioned."

In a paper on the subject of Child Prostitution, read at the World's Social Purity Congress in Chicago in 1893, Mr. Gerry states that there is a fearful theory existing in this country, the more particularly among foreigners, according to which, if any male who has contracted disease through indulgence, can secure a perfectly pure child as his victim, the disease will pass from him to the child. Nor is it only among the poor that these grosser evils exist. If one is to credit the sad whispers of grave officials of the Church as to the morals in boy choirs, or in private and public schools, one finds fearful evidence of the existence, in all ranks of society, of various forms of unnatural vice. As for prostitution itself, the head of a well-known university settlement in an Eastern city names a prominent fashionable avenue lined with the apartments of the kept mistresses of business men. A writer in the *Westminster Review* (May, 1895) significantly gives among the causes of prostitution :

"The luxurious and semi-idle lives led by many members of the well-to-do classes.

"The fact that certain forms of immorality are reckoned among what may be called *fashionable* vices. Drunkenness is gone out of fashion, and some of the lower forms of sport; but it is still by no means unfashionable for the so-called 'man of the world' to have his experiences in the 'half-world,' tho it is true that its inhabitants can no longer hope to bask, as formerly, in the sunshine of good society."

Akin to this evil is that of the organized traffic in girls, which is declared by all who have investigated the subject, to be carried on around the world. A few years ago it was stated to the House Committee which was investigating the immigrant question in New York, by the President of the Woman's National Industrial League, that "syndicates exist in New York and Boston, for the purpose of supplying fresh young girls from immigrants arriving in this

country, for houses of ill fame; agents of the business go abroad and assist in this nefarious business. Immigrants arriving in New York furnish 20,000 victims annually." If this is an exaggeration it is at least the exaggeration of a very great evil. In very many cities agents of houses of ill fame meet girls coming to the cities on the railroads and on the boats. They advertise for girls wanted for light work and good pay. When the girls come they are detained. Agents go out to solicit boys and men as patrons.

A book, *The Traffic in Girls and Florence Crittenton Missions*, exposes many of the traps laid for unwary girls. The schools, private as well as public, are often made the main place for promoting child prostitution, disseminating obscene literature, and obtaining fresh victims.

Mrs. Charlton Edholm said at the Baltimore Congresses (*Addresses*, p. 153): "I stand here in the presence of God, to say that of the 230,000 erring girls in this land, three-fourths of them have been snared and trapped, and bought and sold."

When one realizes that the average life of a prostitute is said to be but five years, one can understand what a traffic it must be to obtain the 230,000 for the United States alone, while alike in Germany and Japan, in France and in England, the traffic goes on.

It is now necessary to ask what are the causes of prostitution, as a means to asking how the evil can be met. Dr. Sanger, in the book referred to above, attributes out of 2000 cases, 525 to destitution, 513 to inclination, 258 to seduction, 181 to drink.

Causes.

Different writers differ from this. The most thorough statistical study was made by the Bureau of the Statistics of Labor for Massachusetts in 1888. It says:

"The statistical method is not the best under which to determine moral conditions; yet, as an auxiliary, it has great efficiency. Statistical science can only be employed to show the results of the lives of the people; it cannot show the inner motives which lead to results. . . .

"Observation is not sufficient, and personal interviews might lead to difficulties greater than those belonging to observation alone. The force of statistics in such conditions is rather negative than positive, and this negative quality is brought into use here.

"It is often flippantly asserted that the shopgirls, those comprising the class under investigation, recruit the ranks of prostitution. . . . Of course, such a charge cannot be entirely removed when applied to any class. The only question here is, Does it apply to the class against which it is brought?"

"A few statistics of a negative character have been collected, relating to prostitution. This partial investigation has been made as to how far the ranks of prostitution are recruited from girls belonging to the industrial classes. It should be distinctly borne in mind that this partial investigation was applied only to what may be called professional prostitutes; for non-statistical investigation can disclose the amount of immoral conduct of any class of people. So that quiet, unobtrusive, and unobserved prostitution, which exists in all communities, has no place in the present consideration.

"Original investigation was made in the following cities: Brooklyn, Buffalo, Chicago, Cincinnati, Cleveland, Indianapolis, Louisville, Newark, New Orleans, New York, Philadelphia, Richmond, St. Louis, and San Francisco.

"In 1884, the Massachusetts Bureau of Statistics of Labor made a report as to the previous occupations of 170 professional prostitutes in the city of Boston, and

the facts then given have been incorporated in this report.

The number of prostitutes as stated in the following table, for any one of the cities named, falls far below the total number of prostitutes in that city, but the number and variety of those from whom information has been received are sufficient to insure representative results. Thus in Chicago, for example, there are, or were at the time of the investigation of the department, 302 houses of ill fame, assignation houses, and 'rooming' houses, known to the police, containing 1007 inmates. This investigation involved 557 of this number. . . .

The facts as to marriage are shown by the following brief table, which gives the number of prostitutes furnishing information in the cities referred to, the number reporting themselves as having been married, and the per cent. of the total number who were married:

CITY.	Number of prostitutes furnishing information.	Number of prostitutes reported as having been married.	Per cent. of married of total number.
Boston.....	170	13	7.65
Chicago.....	557	143	25.67
Cincinnati....	382	77	20.16
Louisville.....	263	70	26.62
New Orleans...	167	4	2.40
Philadelphia...	100	3	3.00
San Francisco	323	81	25.08

It is hardly worth while to take space at this time to give the occupations of all those who have entered prostitution from the different cities involved.

The number of prostitutes giving information was 386, and the following summary exhibits the occupations of this number preceding their entry upon their present life. For this purpose, occupations similar in character have been grouped, and no occupation or group containing less than 10 persons has been included in the classification—those numbering under 10 being put into the general classification of 'various occupations':

Actresses, ballet girls, circus performers, singers, etc.....	52
Bead-trimming makers, embroiderers, lace-workers.....	21
Bookbinders.....	18
Bookkeepers, clerks, copyists, stenographers, typewriters, etc.....	31
Candy factories.....	10
Cigarette, cigar, and tobacco factories.....	78
Corset factories.....	16
Dressmakers, seamstresses, employees of cloak and shirt factories, button-hole makers, etc.....	505
Hair-dressers and hair-workers.....	15
Housework, hotel-work, table-work, and cooking	1155
Laundry-work.....	70
Milliners and hat-trimmers.....	71
No previous occupation (home).....	1236
Nurses (hospital and house), and nursegirls.....	22
Paper-box factories.....	32
Rope and cordage factories.....	12
Saleswomen and cashiers.....	126
Shoe factories.....	43
Students (at schools or convents).....	14
Teachers, governesses, etc.....	23
Telegraph and telephone operators.....	11
Textile factories.....	94
Various occupations.....	211

The following list shows the character of the more important occupations, omitted from the foregoing summary, with the number of women who had been employed in each, and which are included under 'various occupations':

Artificial flower-makers.....	9
Button factories.....	9
Farmwork.....	9
Canning establishments.....	8
Necktie-makers.....	8
Housekeepers.....	7
Straw sewers.....	7
Hat and cap factories.....	6
Bag factories.....	5
Canvassers.....	5

Clock and watch factories.....	5
Box factories (wooden).....	4
Chewing-gum factories.....	4
Florists.....	4
Father curlers and sewers.....	4
Restaurant.....	4

The preceding figures are exceedingly instructive. By them it will be seen that the largest number coming from any occupation has been taken from those doing housework, hotel-work, and cooking; this number, 1155, being 29.88 per cent. of the whole number comprehended in the statement.

The next largest number, so far as occupation is concerned, ranks with the seamstresses, including the dressmakers, employees of cloak and shirt factories, etc., this number being 505.

A fact which strikes one sadly is the large number who enter prostitution directly from their homes. This number is 1236, being 31.97 per cent. of the whole number comprehended.

It cannot be said, therefore, so far as this investigation shows, that the employees in workshops are to be burdened with the charge of furnishing the chief source whence the ranks of prostitution are recruited.

The experience of the writer in making an examination in many cities, both in the United States and in Europe, sustains the statement, but more strongly than the figures here given, that working women do not recruit the houses of prostitution.

Nor does the investigation show that employers of labor are guilty of reducing their employees to a condition of prostitution, as is often alleged. Only in the rarest cases can one meet with a whisper that this is the case. And these whispers, followed to their source, have rarely disclosed any facts which would lead to the conclusion that employers make bargains based on the loss of character of their employees. . . .

Working women are not street-walkers. They could not carry on their daily toil and walk the streets too. A captain of police expressed the matter well when he said that people who charge the working women with walking the streets at night for evil purposes do not know what they are talking about. Night-walkers are, all of them, hardened professionals. The prostitutes, some of them, may have been hard-working women, but no working woman ever walks the streets as a prostitute. This captain said that, when a girl falls from virtue, she has first to graduate as a 'parlor' girl, and then serve some time in a still lower house, before she is hardened enough to take to the streets."

Before, however, drawing inferences from this table, it must be remembered that it is only drawn from the facts as to girls in houses of ill fame. Shop-girls, working girls, are, as a rule, **Economic Cause.** not there. If investigation was made of girls occupying rooms by themselves, quite another story might be found. Even of the bagnios there is another side. Mr. Stead, in his *If Christ Came to Chicago*, gives the testimony of Dora Claffin, the "Madam" of a house of ill fame. She says:

"Prostitution is an effect, not a careless, voluntary choice on the part of the fallen. Girls do not elect to cast themselves away. They are driven to the haunts of vice. The more distinctively womanly a girl is—and I mean by that the more she has beauty, delicacy, love of dress and adornment, feminine weakness—the easier a mark she is for the designing. And the designers are not wanting.

Girls, and I say this emphatically, are not seducers. They have innate delicacy and refinement. I say honestly that I do not believe that one woman in 10,000 would cast herself at the feet of lust except under duress or under the force of circumstances.

The recruiting grounds of the bagnio are the stores, where girls work long hours for small pay; the homes that have few comforts, and practically no pleasure; the streets, where girls are often cast, still unknown to sin, but in want and without shelter; in a word, places outside the levee, where distress and temptation stand ever present as a menace to purity and rectitude; behind every effect there is a cause. In the case of prostitution, the real cause lies not in the girls who fall, but in the social conditions that

make the fall easy, and the men who tempt to the step and furnish the money to support degradation after the step has been taken. Before reform in the levee is possible, there must be reform in the home, on the mart."

All writers on the subject agree in the fact that poverty leads to much prostitution, and that in stores, factories, and offices, salesgirls, working girls, and typewriters are drawn or lured by the lack of money or the desire for money. One speaker at the Baltimore congress considered the factory a mill for the production of prostitutes. Says the Rev. F. M. Goodchild (*The Arena*, March, 1896):

"The money returns furnish a very great temptation to girls to part with their virtue. Some fall because they cannot find work; some because they do not wish to work. Many a girl who is strong, and healthy, and comely, and lazy, learns that there is a market for such as she; that she can earn more in a night by sin than she can in a week or a month by work, and she sells herself accordingly. Mr. Stead reminded the Woman's Club of Chicago that the peculiar temptation of a woman is that her virtue is a realizable asset. This vice costs a man money; to a woman it yields money. Mr. Booth says that the number of young women who receive \$2500 in one year for the sale of their persons is larger than the number of women of all ages, in all businesses and professions, who make a similar sum by honest industry. In sin the prizes come first; in honest callings only after long and painful toil. Even in the common houses on Bainbridge Street, at a 50-cent rate, girls often make \$20 or more a week."

Yet, on one point, one must be guarded in reading these facts. Even if it be true, of which we are not sure, that women of impure life average \$20 a week by their vice, it by no means proves that the average woman can get \$20 per week. A few women of the *demi monde*, mistresses, and even prostitutes, have hundreds, and, perhaps, thousands of dollars squandered on them in a brief while. This enormously raises the average income of their class, but the great mass of these women may get vastly less. At best, their income is but for a few years, and vast, vast multitudes never live in luxury, but in utter want. Perhaps few things have done more harm than the painting of the average life of the prostitute as one of luxury. Such is only exceptionally the case. Many of their homes, many houses of ill fame are said, on the best authority, not only not to be attractive, but to be often poorly furnished, and not seldom loathsome. It must be remembered that the wages of sin rise and fall with the market, and with the conditions of different countries. If in "good times" men throw money away recklessly; in hard times, when women are most tempted to prostitution for profit, they do not. Instances are not unknown where girls have left situations with low wages for the reported "high wages" of the prostitute, and have found, as actual fact, that, as prostitutes, they earned even less than before. Prostitutes starve; prostitutes are "unemployed," even as in any trade. All this must not be forgotten, even while it remains true that an enormous amount of prostitution is due to the economical conditions which often make it next to impossible for a single woman to earn a decent living, and throw thousands of women on the streets, and bring immorality within easy reach of almost any man.

The throwing of the sexes together in fac-

tory and in store, and quite as much in private counting-rooms and offices, has its dangers. Co-education in the halls of learning is winning its way. Working together in communication, where morals are often at their lowest, is another thing. The evil lies not in the mingling of men and women, but in the evil environment.

The stage, the concert hall, and the ball, bear a large responsibility. From the spectacular play and from the ball, with the under-dressed women at the one, and the under-dressed women and the wine at the other, men hurry to the brothel. It by no means follows that the cure lies in the abolition of the theater or the dance (tho some think so), yet the part in this matter played by the present stage and fashionable society cannot be denied. The supreme social cause of prostitution, however, we believe, has not yet been mentioned. This is the crowded tenement. When boys and young girls have no attractive home, and no healthy playground, they *must* be on the streets. A child cannot be kept in the house all day, and live. When a girl comes from a school or from the store, to the crowded living room or flat, and finds the narrow quarters redolent with the steam of washing and the fumes of cooking, she *must* (in the cities) go on the street for fresh air. There bad company captures more girls than in any other one way. Not many girls, we are convinced, sell themselves, *for the first time*, for money; after the first great downward step, money directly plays its part, but the supreme social cause of prostitution we believe to be the bad housing of the poor, resulting from low wages, and the poverty of the great masses in our cities.

REFORM.

There is a very general consensus of opinion that licensing and inspecting houses of ill fame do no good, even in protecting the community from venereal diseases.

M. Lecour, the official head of the Police des Mœurs of Paris, says:

"The administration has redoubled its activity; it has multiplied its acts of repression with regard to prostitutes, and it has definitely succeeded in maintaining a satisfactory condition of the sanitary state of public registered girls, and yet *sanitary statistics prove that prostitution is increasing, and that it is becoming more dangerous to the public health.*" Probably no European official has ever had a more extended experience in the administration of the regulation system than M. Lecour in Paris, and his practical condemnation of it is as significant as it is emphatic. In Berlin, the German Emperor himself being witness, regulation is a most conspicuous failure, intensifying the evils incident to social vice. Indeed, one of the most important and influential moral movements of modern times in European countries is the International Federation for the Abolition of State Regulation of Vice, of which the late Emile de Laveleye of Belgium was for several years the official head. At the Geneva congress of this international federation, Professor Stuart, M. P. of London, thus summarized the progress of the European movement for the abolition of the regulation system: "In England it is clean gone altogether; in most of the English colonies it is gone; in India it is under sentence of death; in Paris it is in ruins; in Italy we have gained a step—the compulsory examination and registration of women are abolished; in Holland repeal has been gained in many towns,

**Licensing
and Inspect-
tion a
Failure.**

and in the whole country the system totters wherever it is retained. In Sweden and Norway, and Denmark and Belgium, the question is before the parliaments of each country, and repeal is at last within measurable distance."

It was in 1864 that by act of Parliament, supplemented by additional legislation in 1866, and again in 1869, the regulation system was introduced in Great Britain, under the name of the "Contagious Diseases Acts." They were applied to sundry military districts,

In England.

ostensibly to promote the health of the army, but with the purpose on the part of their projectors, later avowed, ultimately to extend them also to the civil population. When their real character and object became known, a vigorous repeal agitation was begun, under the leadership of a gifted, noble woman, Mrs. Josephine E. Butler, which was continued for 20 years. At the end of the two decades the repeal movement was triumphant, and the acts were swept from the statute-books. During the prolonged contest the battle of statistics was many times fought, and with great earnestness on both sides. Figures were employed to prove both the hygienic success and failure of the acts.

It was quite clearly shown that at some of the military stations, under the acts, there was a decline in the percentage of venereal maladies after their adoption. But it was quite as clearly shown, also, that this decline, from other causes, had begun prior to the passage of the acts, and that it was even greater after their passage in sundry districts not under their control. Dr. John Chapman, in the *Westminster Review*, in an able summary of the testimony given before a royal commission on this subject, says: "The average annual ratio of admissions to hospital on account of primary venereal sores was lessening at 10 out of 14 stations under the acts before they became operative; and in the course of definite periods before they did so, equal in length to the periods which have elapsed since the acts were put in force, the average annual ratio of admissions at those 10 stations lessened 2.8 per cent. more rapidly than it did during the corresponding periods since the acts were applied."

In the districts under the acts it was claimed by the advocates of regulation, and figures were cited to verify the claim, that there was a generally decreasing number of registered prostitutes and of houses of prostitution. On the other hand, it was shown that, while regular prostitutes decreased, clandestine prostitutes increased; that prostitutes in the districts under the operation of the acts, who refused to register, migrated in large numbers to the adjacent districts, wherein the acts were not in force, and continued to ply their vocation. More absolute power was asked for, over the persons of all single or suspected women, to the end that prostitution might thus be controlled.

But the acts were opposed, and their repeal was demanded by many distinguished men and women. John Stuart Mill spoke strongly against them and the irresponsible power delegated by them, declaring: "It is wrong to give men powers liable to abuse, and then assume that they will not be abused."

Dr. Nevins, after a most careful and exhaustive examination of the whole subject, summarizes the sanitary results of the acts, as follows: "After 16 years' adoption, the rate of improvement in the primary venereal sores, in the subjected portion of the home army, was reduced from 6.7 per cent. yearly for the 6 recorded years before the acts, to 0.65 per cent. yearly during the 16 years of the acts."

"Inefficiency in the navy (20,000 strong), increased from 172 men daily, to 230 men daily."

"Venereal disease rose among the registered prostitutes by above 30 per cent. (from 121.6 to 169.5)."

In America there have been attempts to introduce the registration system in almost all the larger cities, but only in St. Louis has it ever been tried for any length of time, and was there given up after about four years.

"It was in 1870 that the license system was inaugurated in St. Louis. The authority for it was obtained by a legislative trick: the interpolation, without debate, of the two words, "or regulate," into an amendment of the city charter, intended, as was generally supposed, to suppress prostitution. The legal effect of this amendment, as was

In America.

subsequently decided by the Supreme Court of the State of Missouri, was to repeal all State laws prohib-

iting prostitution, so far as St. Louis was concerned, and to give to it a business status as a legitimate industry. A German municipal office-holder was deputed to visit Europe, to familiarize himself with regulation laws there. An ordinance was subsequently adopted, requiring the registry of prostitute women.

"The regulationists of St. Louis, especially those connected with its Board of Health, attempted to show by the figures of the earlier registrations, made at intervals of a few months, a diminution in the number of prostitutes. Dr. William G. Eliot, the honored president of Washington University of St. Louis, who made a most thorough, impartial investigation of the whole matter, says of this claim of a diminished number of prostitutes, that: 'In fact, they had scotched the snake, not killed it, and in all probability the number of prostitutes had not been diminished at all. To scatter a nest of hornets,' he says, 'is a very different thing from its destruction.'

"The results during the progress of the experiment proved an increase of 34 per cent. in the number of brothels, and an increase in the number of registered women of more than 35 per cent. There was also an undoubted increase, meanwhile, of clandestine prostitution. Concerning the sanitary aspect, Dr. Eliot says: 'What is still more startling, when the stamping out process is examined, it appears that while the number of diseased women under treatment in 1871 was 18 out of 480, or 3 3/4 per cent., it has risen now [1873] to an average of 40 out of 653, or over 6 per cent., showing the remarkable fact, to which, however, we can find a parallel in Paris itself, that even among the registered and regularly inspected prostitutes the hateful disease may increase, a result which, though unexpected, ought not to surprise us so long as the male prostitutes are themselves exempt from medical inspection.' How incomplete was the registration, and of how little practical value, in a sanitary point of view, the system of medical inspection was, may be seen from the significant figures presented by Dr. Eliot, taken from the reports of the chief of police of St. Louis, for the years 1871 and 1872. He says: 'The year 1871, ending March 31, shows that out of 3722 females arrested 1526 were prostitutes, and 218 keepers of bawdy houses (the Board of Health report of the same date shows 480 registered prostitutes and 99 keepers) being a total of 1744, or 46 per cent. of all females arrested. The year 1872 shows that out of 3187 females arrested, 2613 were prostitutes and 71 keepers of houses, or a total of 2684, being over 64 per cent. of all females arrested, and an increase of 940 prostitutes arrested, or 18 per cent. more than the previous year.'

"When it was discovered what had been accomplished by legislative legerdemain, a vigorous agitation for repeal began. A petition for repeal was signed by four thousand women of St. Louis, and presented to the Missouri legislature. The archbishop, bishop, and Catholic clergy, nearly all the Protestant clergy, and a majority of the St. Louis bar were enlisted in the cause of repeal, over 150 lawyers and physicians.

"The legislature of 1873-74, after a prolonged and embittered discussion, finally voted the repeal by a vote of three-fourths of all the members of the Senate, and the House by 90 to 1."

The Philanthropist, to which we are indebted for the above details, thus sums up some of the evils of the license system:

"1st. It confers the sanction of law upon the barbarous trade in women.

"2d. It subjects these tempted and often coerced helpless women to the atrocity of continuous compulsory examination by men, and the conspicuous posting of their names as having been thus systematically outraged.

"3d. It fosters vice instead of 'preventing' it, in that it contemplates opportunity, facilities, and safety for the 'guests,' who are more than equal participants.

"4th. It fails to protect health for the community, because it does not adopt any precaution against the spread of venereal contagion by the 'guests' for whose indulgence it provides. It makes no provision for their examination and cure, tho they are much more numerous and dangerous than their victims, as transmitters of disease.

"5th. It makes a permitted trade of the cruel and dastardly occupation of the procurer and procurers.

"6th. It grants permits at a price that will not prohibit the dreadful trade, but will invite to it."

On the other hand there seems little use in the mere effort to suppress houses of prostitution.

In New York City, owing to the agitation conducted by Dr. Parkhurst, hundreds of prostitutes have been turned out of their houses and the houses closed by the police. It is considered a triumph of morals, and other cities are following the example.

But where have the women gone? Have they been redeemed to virtue? If they have, have their male partners in vice been redeemed? If not, even if the women have been redeemed, these men remain to *seduce other women to take the place of their victims that have been rescued from them.* But no informed mind fancies that closing disorderly houses redeems their inmates to virtue. Where then are they? In the flats of the upper middle class and among the tenements of the poor. Formerly they were brought little in contact with home life and childhood. Now they are scattered among the homes and children of New York. Is this a triumph of virtue? Driving sinful women to continue their trade among homes and children, and letting men go free,—is this reform? Dr. Rainsford well says that you might just as well take cases of smallpox, and say they should not be allowed in houses by themselves, and therefore scatter them around among homes.

Nor are these results imaginary. Says the report of the New York Tenement-House Committee of 1894 (p. 88):

"The presence of many immoral women in the tenement-houses, where they are thrown in contact with respectable people, and, worse than that, with large numbers of ignorant and innocent children, forms a most deplorable condition. There has been a manifest increase in this condition during the past year or eighteen months, and there is no doubt that the influx of prostitutes into actual residence in tenement-houses is due to the police raids, which have closed most of the houses of ill fame in the tenement-house districts. Under the old order of things, no matter what its evils may have been, the immoral women occupied houses by themselves. At present they form a part of the life of the great tenement-houses, and thus their contaminating influence is felt far more directly by the general public than was formerly the case. The tenements always have had, and probably always will have, their share of immoral women—of a class peculiar to them and separate from the professional prostitutes driven of late into them, from houses of ill fame. Most of this tenement class consists of women who have been abandoned by their husbands, and who, in order to support themselves and their legitimate children, are driven to depend to some extent upon evil sources of income. Such abandonment is distressingly common among certain foreign nationalities. Probably so cases have been brought to your secretary's attention. These women, however, generally work when they can, and turn to prostitution only as a last resource. They are surrounded by none of the glamour of the professional prostitute; do not ordinarily live or dress more elaborately than other inmates of the house in which they live, and are generally regarded with more pity than envy or resentment by their neighbors and their neighbors' children. Thus they are not so especially dangerous to the morals of the house. But an apartment full of such prostitutes as have now been driven into the tenements, where they are surrounded by comparative luxury, and live lives of apparent ease, in the midst of a houseful of adults and children, whose frugal, honest living is obtained only by the hardest of work and the most rigid economy, can scarcely be less dangerous to the moral health of the house than an apartment full of cholera-infected persons would be to the physical welfare."

Mere Raiding a Failure.

Some persons, therefore, like Dr. Rainsford, would not license or inspect houses of ill fame, but simply, if they do not become too bold, allow them within certain limits by themselves and try to fight the evil by lifting up the general standard of the community.

But the complete districting of the evil seems impossible, if desirable. Mr E. T. Gerry, in *The Philanthropist* (March, 1895),

thus describes the results of the two main experiments in this direction:

"In the winter of 1886-87, while at the City of Rome, Italy, I had a personal interview with Cardinal Simeoni, which lasted over two hours, chiefly in reference to the course pursued by the Italian Government while in the hands of the Vatican, in the matter of regulating prostitution. The Cardinal stated to me that the experiment of attempting to confine sexual vice within a specified district had been most thoroughly tried. A portion of the city, remote itself and not particularly attractive for purposes of residence, had been selected. . . . At the same time a very strict cordon of police was placed around the geographical boundary, and any attempt on the part of females who had once entered the district to escape therefrom was followed by prompt and immediate arrest. The idea was so novel that at first quite a number of registered prostitutes entered the district, hired and occupied the houses, and attempted to ply their vocation there. But the district soon became very notorious. The thieving, the lawless, and the seditious found their way there, and became permanent residents. They brought with them very little money, and as the sole means which the inmates of the district had of supporting themselves was by the sale of their persons, it was obvious that their custom must come from without and not from within, as men generally did not care to be known as inhabitants of the district. And as soon as the fact of its establishment was made public, men were very wary about entering the district for fear of identification. . . . It was not long before the storekeepers complained that they could not make a living. Even the women found that the money did not flow in upon them as it did when they practised their calling unrestricted by geographical limits, and it was not long before escapes from the district became impossible of prevention by the police, and some of the most notorious women in Rome, after having been put there, and sent there, made their escape and were found in other quarters, plying their trade. . . .

"The Cardinal stated to me that the attempt to district vice was in his judgment a stupendous failure; that the Church had used every effort to reclaim the fallen when so environed by the police and placed in a locality where it could put its hand upon them, but to no purpose.

"One further effort for localization of the social evil deserves to be noticed, that of the Yoshiwara in Japan. For a long time previous to the contact of Japan with the enlightened nations of the earth, the social evil was looked upon as one necessary and unavoidable, and the government took entire charge of the matter. In a suburb adjacent to the Capital (Tokio) large houses were built for the purpose, some of them elaborate in construction, and the whole guarded most thoroughly by the soldiery. The number of prostitutes in Tokio alone is said to be about 5000. The children of the poor are usually utilized for the purpose and sold by their parents, who receive a stipulated income as the result. It is not an unusual thing for these girls to marry, and they are not looked upon as outcasts or pariahs of society by any means. The girls in these establishments range in age from 10 to 18, and owing to the developing influences of the climate, at the latter age they are as mature as most of our women at 25 to 30. These are the regular, so to speak, licensed or recognized prostitutes. The women are permitted to leave and marry when they choose. This number of course does not include the kept mistresses of foreigners or others, who occupy small houses at the expense of their maintainers. Of these districts, which are known as Yoshiwara, there are five in Tokio and two in Yokohama, the latter possessing probably the largest and best known. The government has entire charge of the system, derives extensive revenue as the result, and under the Japanese code of morals, from which sexual morality is practically excluded, it is said to be a success so far as engendering public peace and quietness. Such a course naturally destroys all appreciation of the vice as vice."

Yet, on the other hand, there seems little hope in leaving the evil alone.

In London there is neither license, examination, nor practical restriction. After sunset there are certain streets in the most public part of London, notably Regent Circus, where not only a seething throng of

Districting a Failure.

prostitutes openly solicit from that time up to midnight and even later, but where a decent woman can hardly walk with a male escort without being insulted, and often an effort made to separate them. The police usually limit their attempt to keep the peace to requiring these women to move on, and as passers-by do not care to make complaints against them, they simply do move on. A large number of the brothels are situated on the outskirts of London, in such places as St. John's Wood, Pimlico, and the like, which are easy of access by cabs and the railways. Most of these street prostitutes are said to be discharged from the Continent, because infected with disease. So far as New York city is concerned its streets are absolutely decent, compared with those of either London or Paris.

It is thus easier to show what not to do than what to do. With the means of reaching the evil through personal work, religious or ethical, we are not, in this encyclopedia, concerned. Many, however, believe that this is the main thing to do, to raise a higher standard of personal purity, and, above all, an equal standard of purity for both sexes.

Ethical Means.

The writer of the article in the *Westminster Review*, quoted above, says:

"One aim most, if not all, schemes of reform have in common, and that is the establishment of an equal standard of sexual morality for both sexes. On all sides it seems to be agreed that the existing dual standard of morality is, or will be, doomed, now that society, and especially the female portion of it, is becoming so keenly alive to its evils. It is also felt that unless masculine morality is raised to a higher level, feminine morality may fall from the exalted position it has held for so long, as it awakes to the full value of the fact that its purity is only playing into the hands of the impurity which it encounters in the other sex. The proposed paths toward the desired goal are very wide apart, but there are a few main ideas on the subject which can be briefly described.

"First, there is the movement started by those persons who believe that the purification of our social morals can only be attained by setting up for men the same high standard of chastity and pureness of living as that which has been hitherto considered as binding only upon women of the protected and wife-supplying classes.

"Then there are those who take an exactly opposite view, and who believe that the end is to be reached by some extension of sexual freedom to all classes of women. They regard the attempt to raise men to that high level of morality hitherto reserved for women as a natural impossibility or utopian dream, and they would seek for equality by lowering the standard for women, and thus bridge over the wide gulf which now exists between the average sensual man and the average chaste woman, and still more between the average chaste woman and the woman of the streets."

The writer sympathizes with neither of these extreme views, and favors what he regards as the middle course, *viz.*: reform of sexual morality through more liberal divorce laws. He believes that erring humanity ought to have the opportunity of retrieving even its matrimonial mistakes and failures, and that the sacrifice of individuals to an absolute system is neither moral nor expedient. The current objections to liberal divorce laws he regards as based on religious prejudices rather than on utilitarian social considerations.

For the contrary view, see **DIVORCE**.

The resolutions adopted at the Baltimore Congress were as follows:

"That chastity, a pure, continent life alike for men and women, is consonant with the best condition of physical, mental, and moral health.

"That prostitution is a fundamental violation of the laws of health, is degrading and destructive to the individual, a menace to the home and to the nation.

"That State or municipal regulation of prostitution is morally wrong; is worse than a sanitary failure; is cruel and unjust to woman, creates a shocking traffic in girlhood.

"That all possible effort should be made to educate public opinion and maintain a high equal standard of morals for both men and women.

"That facilities should be provided for the treatment of venereal diseases, as readily as all other diseases, in all hospitals under the control of municipalities or other public bodies, as well as in those supported by voluntary contributions.

"That homes should be everywhere established by municipal and State, as well as by voluntary aid, as agencies for the reclamation and rehabilitation of erring girls.

"That the State should punish by imprisonment rather than fine, organized prostitution, procurism, the keepers of the houses of prostitution, and the rental of houses or other dwellings for such purposes."

Various speakers emphasized the responsibility of parental teaching. Said the Rev. S. S. Steward, "We must begin in the earliest infancy." The whole of his valuable address (see *Addresses*, as above, p. 202) gives most practical suggestions to parents. Says the Rev. F. M. Goodchild (*Arena*, March, 1896):

"The first thing to do, probably, is to arouse the people to a sense of the enormity of the evil as it exists among us. . . ."

"The best mitigation, probably, must come from our homes. Parents have been criminally negligent. Ignorant innocence leads most girls astray. A prudish silence lands many a girl in the brothel, and provides her customers as well.

It ought to be possible to impart to our children some instruction about these most important relations of life, without mantling the cheeks of parent or child with a blush. It is little short of criminal to send our young people into the midst of the excitements and temptations of a great city with no more preparation than if they were going to live in Paradise.

"And I cannot escape the conviction that women hold in their hands the key to the solution of this problem. They are cruel in their severity toward their fallen sisters, but they are criminally indulgent toward the men who cause their fall. The woman sinner is reprobated. But the man sinner is made a hero, is welcomed into respectable homes, is permitted to marry a pure girl and make her the mother of children, cursed before they are born with lecherous appetites. Let woman's attitude be changed."

Yet, undoubtedly, organized society can do something. It can prohibit solicitation on the street alike for men and women. It can arrest and expose men as well as women in disorderly houses, condemning them to punishment and exposure, and not merely to a fine. It can change the laws and make them bear equally on men and women (see **AGE OF CONSENT**; **MARRIAGE**; **DIVORCE**; **WOMAN**). There is no question that fear of exposure does deter many men from visiting these houses.

Yet many reformers, all socialists, all extreme individualists, and a growing number of earnest men and women of all schools of thought, believe that none of these legislative reforms go to the bottom social cause of prostitution. As they find the cause of prostitution in poverty

they would remove prostitution by attacking poverty. (See **EIGHT-HOUR PHILOSOPHY**; **SINGLE TAX**; **SOCIALISM**; **TRADE-UNIONS**; **UNEMPLOYMENT**; **COOPERATION**.) If the supreme social cause of prostitution is, as we have stated above, the crowded home—the supreme social means of attacking the evil is by improving the dwellings of the masses in our cities, and giving well-paid work to all. (See **SOCIALISM**; **MUNICIPALISM**; **SINGLE TAX**; **TENEMENTS**; **FAMILY**; **DIVORCES**; **MARRIAGE**; **AGE OF CONSENT**.)

The Home.

Economic Reform.

(1858), last edition, with an appendix for facts as to New York down to date (1895); *The National Fertility Congress, its Papers and Addresses*, edited by A. N. Powell (1895); *The Female Offender*, by C. Lombroso (1895). (See also FAMILY; WOMAN; WOMAN'S WAGES; SLUMS, etc.)

PROTECTION.—An opinion prevails in some circles that, while free trade is scientific and founded upon natural law, protection is artificial, devoid of philosophy, and but a scheme of selfishness. Protectionists claim that this is untrue; that the theory of protection is, to say the least, as philosophical as that of free trade; that it is more natural, because built upon self-defense, which is the first law of nature; that it promotes, rather than hinders, the development and enjoyment of natural business opportunities; that it coordinates national existence, and forms the chief reason for it; that it is less selfish than free trade, because it is necessarily cooperative, and that it is more universal, because it is applicable to all the industries of a people, while free trade unavoidably sacrifices some to others.

I. HISTORY.

The history of protection is the history of civilization. Every group of humanity that has risen a degree above barbarism has adopted some form of protection. Preparations for war, the sometimes provocative of war, are generally regarded as protective to peace. Washington advised this precaution in his farewell address. Anciently a nation's commerce, industry, and existence depended upon its readiness for instant defense; nowadays strength in all the resources for war is more important than weapons in hand. An industrial policy which makes the unit man self-reliant and resourceful, and not dependent upon others, is commended by free traders; it is equally claimed by protectionists in its applicability to groups. The people who purchase ore, or wheat, or wool, because it is temporarily easier or cheaper to exchange for them lumber, or fish, or furs, than it is to raise them, never become strong for either peace or war. A few individuals, engaged in trade or transportation, may thrive. But the laws of business are not confined to the handling of merchandise. Production is more important than distribution. The nations which have attained highest development are those which have made the most of their natural endowments. Without a single exception they have done this by protection in some of its varied forms. The only free-trade nation on the earth to-day, Great Britain, attained greatness through centuries of protection, and maintains maritime supremacy still by that means.

Commerce between the nations of antiquity was almost exclusively in dissimilar or non-competing articles. The most instructive and eloquent description of this commerce is found in the twenty-seventh and twenty-eighth chapters of Ezekiel, in which the prophet portrayed the glories of Tyre. The peculiar products of all lands were brought to Tyre—fine linen from Egypt; purple from the Greek islands; silver, iron, tin, and lead from Tar-

shish; brass from the Taurus; horses and mules from Armenia; horns of ivory and ebony from many isles; wheat, honey, oil, and balm from Israel, and sheep and lambs from Arabia, all of which were traded for Tyrian wares, "by reason of the multitude of thy handiworks," and "when thy wares went forth out of the seas, thou fillest many people; thou didst enrich the kings of the earth with the multitude of thy riches and of thy merchandise." So all this commerce appears to have been mutually beneficial; hence there was no occasion for protection against any part of it by Tyre, or by the other nations. Competition, in the modern sense, was practically unknown. Whenever it appeared war resulted, and one nation or the other was reduced to vassalage.

Ancient Times.

There is no record of the revenue laws applicable to commerce. "Ships of Tarshish" (that is, ocean vessels in contradistinction from the smaller craft that sailed interior waters) were built in the time of Solomon, upon both the Mediterranean and the Red seas, the former trading as far west as Tartessus, in Spain (whence the name Tarshish), and the latter bringing to the country of the great king the gold of Ophir, an unknown region of the Orient, which is supposed to have been India. Without doubt, these commercial enterprises rendered tribute to the Government, but upon what principle it would be useless to speculate, since history does not tell. At the time of Christ, industry had become more varied and commerce more extensive. Phœnicia, Greece, Carthage, and Rome had long been maritime nations, while caravans of camels, those "ships of the desert," which formerly bore the traffic of Nineveh and Babylon, Philadelphia and Petra, continued to cross the ranges between Damascus and Tyre, or to Jerusalem and Joppa, and between Persia and Egypt. When Matthew was called to the discipleship, he was "sitting at the receipt of customs," on the western shore of the Sea of Galilee, but whether he collected from the caravans, or whether the term "customs" was used indiscriminately for tax or tribute, external or internal, there is nothing to show.

There is almost equal obscurity as to the customs laws of later Rome. Some of the time, at least, protection was applied on land, along the great roads, where traffic was often competitive. This was the case under the illustrious reign of Theodoric, the greatest of the Gothic kings, whose chief desire seems to have been to "restore to Italy its long-lost material prosperity and plenty." He repaired highways and aqueducts; drained lands; opened mines; built vessels; restored the coinage to its proper value; established a uniform standard of weights and measures, and put a stop to the extortions of the custom-house officers, which "foreign merchants had dreaded more than shipwreck" in the days of the empire. But in doing away with this abuse of administration, he apparently failed to perpetuate, by higher

Rome After the Empire.

and uniform duties, the protection which it had afforded. Reviving prosperity caused extensive importations of luxuries from the East. They were purchased by the upper classes in such quantities as to drain the nation of its gold, sometimes at the rate of \$4,000,000 a year, and thus unemployment and decay set in. The people took alarm at this, and in A. D. 535, Theodoric having died nine years before, a law was enacted forbidding senators, who had been the greatest importers, to own vessels of burden. This put a ban of plebeian degradation upon all commerce, and this was followed by agricultural decay for want of industrial variety. The Romans were invaders, settlers, builders, warriors, mariners, farmers, but they did not excel as merchants and manufacturers. When conquest ceased to add to their riches, their economic science was not far enough advanced to supply the deficit from their own resources. So long as they could thrive at the expense of others, their thrift was great; left to themselves, they failed.

Venice and Later Italy.—But after 300 years, those who had fled before the Goths and Huns to the marshes of the Adriatic began to develop the wonderful city and commerce of Venice. Forced to a seafaring life, they became familiar with the productions, and, gradually, with the processes of other peoples. To commerce they added manufacture, and soon became famous for ingenuity. They excelled all but the Orientals in the manufacture of textiles, metals, and glass; and as this brought them into direct competition with the artisans of the East, laws were enacted to encourage home production, and to prevent workmen from carrying their arts to

foreign countries. Other Italian cities—Florence, Naples, Genoa, Milan—followed the example of Venice, and became seats of fine production, from which Europe drew supplies. After centuries of

unexampled prosperity, Venice became involved in foreign wars, and fell into decay, but United Italy is enjoying greater thrift than ever before, as the result of the wise industrial policy which Venice started, and which, extended and improved, is the national policy to-day.

The Hanseatic League.—It has been claimed that the manufactures and commerce of the 85 free cities of the Hanseatic League, which flourished in western Europe from 1241 to 1575, were built up without protection, and were greatly promoted by free trade. The fact is otherwise. The League itself was for protection from the cupidity and oppression of the monarchs of those countries; from piracy; from the cornering of raw materials; from trespass upon the field or specialty of one member by another; from the theft of their processes by aliens, and for the encouragement of guilds, apprenticeships, invention, and progress in handicraft. To be sure, there was no protective tariff, in the modern sense, but this was because there was little or no foreign competition, and because nearly all commerce was an exchange of dissimilar articles, pecu-

liar to different countries. It is precisely this kind of commerce which the protective reciprocity of the United States tariff of 1890, and the French minimum schedules of that same year, applicable to trade with nations making similar concessions, sought to promote.

Flanders and Holland.—What has been said of the Hanse towns applies equally to the Flemish and Dutch a little later. They attained supremacy in manufactures, first, by supplying the home market, and then foreign markets, with goods that were different from what others offered. They did not attempt to compete with Venice in silks, or with India in cottons, but they became the best spinners and weavers of flax and wool in the world, and their cutlery, armor, and leather equaled the famous products of Damascus and Calcutta, which were then more expensive. About the year 1400 both Spain and England sent their wool to the Netherlands to be worked, and some 40,000 looms (all hand-loom, of course) were in constant operation in each of the cities of Lille, Ypres, Ghent, and Bruges. Naturally such employment made agriculture profitable, and built up a large commerce. During the fore part of the sixteenth century Antwerp was the commercial emporium of the western world, from 2000 to 3000 vessels often crowding its harbor at a time. In the latter part of that century the Dutch republic became the chief money market and maritime power of Europe, as a result of the domestic employment, the skill and frugality of its people. Having become strong enough to enter upon foreign enterprise, the republic chartered the Dutch East India Company, with a capital of about 6,000,000 guilders (about \$2,400,000), which preyed upon the commerce of the Portuguese, Spanish, and English, and gained complete control of the commerce between Europe and the Orient. For some years this proved enormously profitable, but two evils grew out of it—first, impairment of some of the home industries, and, second, perpetual conflict, with a final loss of the trade to the French and English. With this exception, the Flemish and Dutch manufacturers sustained no competition until about the middle of the seventeenth century, when the English and French, under government patronage, hired their most skilled artisans, and built up competition which soon left them no assured market but their own, and that was saved only by a protective tariff. A recent writer says: "The people of France were wearing the woolen clothing made by the Flemish, and did not establish woolen factories until Robais, a Hollander, was invited to France, and induced to establish a woolen factory at Abbeville, under the protection of the Government. The people of England had shipped their wool to Flanders, where it was carded, dyed, made into cloth, and returned to them to clothe their people. They did not establish woolen factories until Edward III. invited John Kemp with his weavers into England to set up their industry, prohibited the export of wool, and gave the woolen manufacturers the protection of the Government."

Until England had been twice invaded and

conquered by foreigners, and until the foreign and domestic trade had all fallen into their hands, no attempt was made to recover for Englishmen their natural opportunities. King after king had sold concessions to aliens, and the native population, almost exclusively farmers and miners, with no home market of any value, and

Protection in England. dependent upon other countries for all the products of industrial art, was kept in hopeless poverty and weakness. Finally the Anglo-Saxon spirit rose. There was a revolt against the aliens. It took the form, under Edward I., of higher duties on goods imported by strangers than by Englishmen. Under Edward II. this policy was abandoned, but in 1337, a statute of Edward III. "laid the foundation of the liberties of the people, by providing for the diversity of their employment, and the development of individual faculties." This famous statute prohibited the exportation of wool and the importation of woolen cloth, and required Englishmen to wear domestic cloth. Such a statute could be called drastic and tyrannical now, but it was absolutely necessary then; in no other way could domestic manufactures have been established in the face of all the advantages held by the aliens. The policy was strengthened in subsequent reigns. Under Richard II. it was "ordered and assented that no merchant stranger alien shall sell or buy merchandise within the realm with another stranger merchant alien, to sell again," and under Edward IV. the first of the corn laws "prohibited the import of foreign-grown grain when the price of wheat at the port of entry did not exceed six shillings and eight pence to the quarter." In 1463 a statute prohibited the importation of 67 manufactured articles in most common use; really more than that, for some of them were classes of articles; in 1488 Henry VII. induced skilled laborers to come from the Continent and instruct his people, and in 1552 a general act was passed for the regulation, control, and encouragement of the woolen industries of the realm. Navigation laws were enacted under Mary and Elizabeth, which gave such preference to English shipping as to drive foreign ships from the internal, coastwise, and foreign trade of the realm. Thus, in 200 years, by the most rigid policy of protection ever before or since set up by any nation, England rose from practical vassalage to one of the most independent, prosperous, and powerful countries in the world, and gained the ascendancy in manufactures, trade, commerce, and wealth, which, in many respects, is maintained to this day, and which in no way has been surpassed, save by other protective nations. Those who attribute Britain's greatness to free trade, which did not begin until 1846, when her industrial primacy was of itself protective, and was sure to remain so for many years, must have forgotten all her earlier history, and must have attached more importance to the cramp and hindrance of the gilds which were a part of the protective policy, and to some of the prohibitions, which, however necessary and useful in the beginning, afterward became a

hindrance, than they attached to the great and necessary acts which emancipated England from industrial, monetary, and commercial servitude, and made her factories and her artisans, her merchants and her ships, the wonder and the envy of the world.

Until near the close of the sixteenth century the condition of the people of France was similar to that of the English a century before. But in 1592 Henry of Navarre became king, and with a purpose to develop the country, Sully, who was appointed Minister of Finance, studied conditions in all parts of the realm, and soon the nobles

were prohibited from taxing the people; the royal treasury became **Protection in France.** plethoric; roads, bridges, and canals were built; mines were opened, and manufactures were introduced by giving protection to artisans who were induced to come from Holland and Venice. Slow progress was made under the next reign, that of Louis XIII. and Cardinal Richelieu, but in the latter part of the long reign of Louis XIV., with the great Colbert as Minister of Finance, not only was Sully's system of internal improvement continued, but the first general tariff of duties upon imports was enacted. This was in 1664. The principles upon which this tariff were based were: "1. To reduce the duties on the importations of all articles required for the manufactures of the kingdom, and 2, to exclude foreign manufactures by raising the duties." In 1667 duties were much increased on such articles of foreign production as competed with the new industries; towns sprang up where there had been but wastes; the people turned from discontent to occupation, and the country grew great and strong. After the death of Colbert the king committed the fatal blunder of persecuting the Huguenots, with the result that nearly 400,000 of the people, most skilled in industry, fled the kingdom, and spread over countries that soon became rivals in peace and enemies in war. The next century was one of many wars and abuses which culminated in the Revolution. An experiment in fiat money had been tried, with disastrous results, of course. Fully one-half of the people belonged to the privileged classes, and paid no taxes. Agriculture, thus doubly burdened, fell into decay. Such conditions had not been favorable to the growth of manufactures, and what protective laws remained were all but inoperative. And what was even more to be deplored, they were confused by a school of French economists which became known as physiocrats, which was formed by Quesnay, the physician of Louis XV., and which first promulgated the free-trade doctrine of *laissez-faire*, "let things alone," with the abuses of power which were tyrannical on the one hand, and paternal on the other. These so-called economists failed to see the difference between a government's protecting the natural opportunities of its people and the exemption of favorites from taxation, or between promoting the growth of industries which would afford employment, yield wealth, and reduce the cost of necessities, and the granting of mo-

nopolies, farming the collection of revenue at excessive profits, and the placing of duties upon exports as a means of replenishing the plundered treasury. In the presence of so many abuses of power, every act of government that related to revenue, or to the industries of the people, seemed to them alike a wanton interference. It is easy to excuse them for the failure to discriminate, but the motto which they coined for their place and time, and which has been accepted as the fundamental principle of free trade, is seen in the light of the subsequent history of France, and of all other nations, to have its limitations. "Let alone" may well be said to a blacksmith who would tinker a watch, but what man of sense would cry it to a general about to repel an invasion; a board of health redeeming a marsh, or a government whose people are competing against the export bounties and subsidized ships of other nations? Napoleon Bonaparte, who, if he had known when to stop his foreign wars, would have been the greatest statesman as well as the greatest conqueror of his time—he of whom Byron wrote

"A single step into the right had made,
This man the Washington of worlds betrayed"—

did not forget the industries of France, and did not neglect the means for their promotion. "Duties," said he to Las Casas, at St. Helena, "which were so severely condemned by political economists, . . . should be the guaranty and protection of a nation, and should correspond with the nature and the objects of its trade. . . . Foreign trade, which, in its results, is infinitely inferior to agriculture, was an object of subordinate importance in my mind. Foreign trade is made for agriculture and home industry, and not the two latter for the former." During, and since his reign, France made its greatest progress in the arts of peace, for protection has been its policy, with the exception of a partial abandonment, which Cobden persuaded Louis Napoleon to make, and which was one of the causes that led to the downfall of that emperor, and the humiliation of his country. During the 20 years of the Cobden treaty French commerce declined 65 per cent., and many industries barely lived, thanks only to the partial protection that remained. On the 26th of January, 1876, M. Thiers, afterward the first president of the French republic, and one of the greatest statesmen of any country, ancient or modern, in speaking upon tariffs to the Assembly, drew this instructive and most prophetic contrast between France and England. After complimenting England for its civil liberty, and other great characteristics, he said :

"But I may be allowed to say that it has in its industrial greatness that which is not so solid as the situation of France. France has her consumers within itself. Its market does not depend upon a cannon-shot fired in Europe. And for exportations she has her beautiful products. England, on the contrary has an artificial existence. She depends upon the days of the United States; upon the doings of her colonies, which already oppose her with hostile tariffs. May not the day come when its immense production will find no purchasers? She produces ten times as much

as her consumption. This little island, in the words of Fox, embraces the world. True; but when she embraces the world, she is vulnerable everywhere. Such was the situation of Holland in the seventeenth century, which had realized a prodigy almost as marvelous. What was needed to make Holland, which gave laws to France, descend from this lofty place? It needed only 50 years. It needed only a Navigation Act in England; it needed only a Colbert in France. God forbid that I should predict for England such a destiny! but I repeat it, her existence, which depends upon consumers which she seeks everywhere without herself, is less solid than that of France, which has her consumers in her own bosom."

Germany is no less interesting than France. The first progress in manufactures began with the coming of the Protestant refugees from France after Louis XIV. had revoked the Edict of Nantes. Under Frederick the Great, from 1746 to 1786, the economic policy of Prussia embraced duties on imports, bounties on exports, premiums on production, and **Protection in Germany.** exemptions of new manufactures from taxation, and the result was an unprecedented development of all the industries of the kingdom. The smaller German states presented a less encouraging picture. Governed expensively, their exactions of revenue were burdensome to industry and restrictive of trade in its natural field. Later their industries were nearly crushed by the Napoleonic wars and the inundation of French and English goods after the battle of Waterloo, but in 1818, Prussia leading, they adopted a vigorous policy of protection. It abolished State monopolies and special privileges to individuals, gave all citizens equal chances, admitted necessary raw materials free, and adhered to the system of duties and bounties established under Frederick. Subsequently it was found that most of the states were too small for each to set up a national policy of this kind. They needed each other's markets. In 1833 six of them formed a Zollverein, or customs union, with no duties between themselves and with a division of outside duties according to population. By 1842 the other German states had come in. The basis was the Prussian tariff of 1818. The administration was by a Zollverein Parliament, which was succeeded by the German Reichstag when the Empire was formed in 1871. From time to time duties had been raised to meet aggressive importation, but the production of fine goods had hardly been attempted, and the classes which consumed them were easily persuaded by Mr. Cobden that they ought to have them free of duty. Those classes were influential. The result was that a free-trade wave swept over Germany, first in the form of lower duties in 1865, then in a commercial reciprocity with Austria in 1868, and by successive annual reductions until the full English policy was reached, when everybody felt rich and grew extravagant and careless under the payment of the French indemnity in 1871. The result of open ports was to close the factories. There was failure upon failure. Wages and prices fell, but taxes rose. Foreign corn depressed agriculture. The people wore the fabrics of England and France, and labor began to starve. A powerful reaction set in. Bis-
